Rubbish Masquerading as Tea.—Five hundred and eighty-two half-chests of stuff called tea (about 30,000 lb.), which recently arrived at the Albert Docks, and were seized by the sanitary authorities of the Port of London, were brought to the West Ham Police-station on Tuesday and submitted to Mr. Gillespie, one of the magistrates. The tea, which was said to have been submerged in Marseilles Harbour, looked like a mixture of mouldy manure and black and green mud, and Mr. Spadaccini, one of the food inspectors, asked that it might be destroyed. Dr. Collingridge, the medical officer of health, in supporting the application, said he had made experiments and found that though the tea was so bad, it could be "faked" and put on the market in such a condition as to deceive the purchaser. Mr. Gillespie ordered the whole consignment to be destroyed under the supervision of Customs officers.

A Big Cheque for Duty.—Lipton, Limited, have paid Her Majesty's Customs a sum of £76,847 9s. 1d., representing a clearance of over 2,000 tons of tea, a quantity equal to the average weekly consumption throughout the whole of the United Kingdom.

Cinnamon as a Cure for Influenza.—Cinnamon should be in increasing demand. Dr. Carne Ross, in the current number of "The British Medical Journal," claims to have discovered a cure for influenza. His remedy is simple. All that one has to do, according to Dr. Carne Ross, is to dose oneself with cinnamon as soon as one feels the grip of the microbe. The doses have to be repeated at intervals, first of half an hour and then of an hour, until the temperature becomes normal, and the patient must stay indoors for twenty-four hours afterwards. By that time, Dr. Carne Ross believes, the disease will have disappeared. This is not the first time that cinnamon has been suggested as a specific for influenza. But its properties seem now to have been tested with unusual thoroughness, during a period of five years, and the result has made the investigator an enthusiastic believer in its value.

AMERICAN TEA TRADE.

An interesting view of the United States tea trade is given in the following table, extracted from an American contemporary, which shows the chief countries from which the Americans derive their tea :—

Countries		1897.		1898.
France	... lbs.	209	...	333
Germany ...	... ,,	39,093	...	586
Italy	... ,,	367	...	640
Netherlands ...	... ,,	20,143	...	280
Russia on Baltic and White Seas	,,	600	...	270
United Kingdom ...	... ,,	6,217,726	...	2,971,116
Dominion of Canada—				
Nova Scotia, N. Brunswick, &c.	,,	90,531	...	27,128
Ontario, Quebec, &c. ...	,,	2,155,758	...	1,305,817
British Columbia...	,,	1,005	...	168,336
China	... ,,	53,524,546	...	39,754,736
East Indies—				
British ...	... ,,	2,117,433	...	2,237,897
Dutch ...	... ,,	5	...	—
Portuguese ...	... ,,	5,714	...	—
Hong Kong ...	... ,,	408,617	...	189,972
Japan	... ,,	45,465,161	...	22,798,308

The effect of the duty imposed (to meet war expenses) in the Revenue Act of June 14, 1898, has been to reduce importations to a minimum. The general importations for warehousing have been as large during the last half of 1898 as they were during the corresponding period of 1897, but the withdrawals from warehouse for consumption upon which duty is actually paid have been much less. It is stated that no change in the duty will be made before the summer of 1900.

THE INDIAN CURRENCY COMMITTEE.

The summary given by Reuter of the second volume of evidence taken before the Currency Committee is not of engrossing interest. Our daily contemporaries publish it in the following form :—

Lord Northbrook deprecated the reopening of the Mints, which would increase taxation and be unwise and dangerous, and urged that sovereigns be made legal tender in India with free mintage of gold. He also advocated an Imperial grant for the purpose of making a gold standard effective.

Messrs. Cheetham and Graham, merchants, advocated the reopening of the Mints, which would ultimately steady exchange. In their opinion a gold standard was desirable but was impracticable.

Messrs. David Cruickshank and Rustomjee described the disadvantages which had arisen through the closing of the Mints and favoured a gold standard at fourteen pence.

Sir Robert Giffen condemned the closing of the Mints, and mentioned incidentally the deficit resulting therefrom, which by their reopening would probably be reduced by three to four millions annually if India was treated fairly as regards home charges. A gold standard was unsuitable for India because the currency would always be chiefly in silver. Convertibility would remove many objections to the Government scheme, but the reopening of the Mints was the least disadvantageous of the courses open.

Sir Alexander Mackenzie declared that the reopening of the Mints would necessitate a considerable increase of taxation, involving the risk of disturbances.

Mr. Romesh Dutt criticised the currency policy of Government and favoured letting the rupee sink to Bullion value. In his opinion the people of India did not desire a gold standard.

Sir John Lubbock said that a gold standard was impossible without a gold currency, which was not suitable to India. He favoured maintaining the value of the rupee by the imposition of a heavier import duty on silver. With this and a seignorage it might be possible to reopen the Mints.

Mr. Barclay, President of the Manchester Chamber of Commerce, said that the proposals to Government by Mr. Lindsay aimed at upholding exchange and ignored the interests of the people. He urged the reopening of the Mints with concurrent mintage by America at a rate of 42 pence per ounce.

Lord Farrer said that bimetallism as a solution of the question was impracticable and that the reopening of the Mints would be injurious to trade and ruinous to the finances. He advocated a gold standard with an automatic currency based on gold and having a fixed gold value The only sound foundation of a gold standard is convertibility. He also thought it desirable to obtain the support of the Imperial Government to establish a gold standard.

Mr. Leonard Courtney recommended Government to confine itself for the present to opening the Mints to the coinage of gold and in the meanwhile to accumulate gold. The Government, he thought, should not undertake to convert rupees into gold

CEYLON TEA IN THE UNITED STATES.

We note that Mr. R. E. Pineo is not an approver of the suggestion that the Tea campaign in the United States should be abandoned. He asks various questions and. no doubt, pauses for a reply :—

Who among you is in a position to measure, or to accurately forecast, the results of his efforts? Do you fully realise the stupendous opposition, difficulties. and prejudices that he has encountered and contended with? Are you thoroughly familiar with American methods and the difficulties attendant upon introducing a product that is not wanted by the trade? Have you ever considered the position of the wholesale dealer in tea, in his relation to your staple? Has he not got an established business that gives him fair returns; and, would it not be suicidal to relinquish or change it, in order to handle and create a demand for an article that there is no sale for?

Have you succeeded in educating the Russians up to that point where they like and will have your tea? Whose business is it to impart this education?

Look at these questions in a spirit of fairness and equity, and then say—on whose shoulders the burden of making your staple known and creating a demand for it must rest? Has your experience of advertising, as it is conducted in the United States, been of a character that will enable you to determine its success or failure, or when to discontinue it; or the best methods to adopt in pursuing it? Do you know what the experience of the American successful advertiser has taught him, and what he now completely, wholly, and thoroughly believes in? Are you able to determine the result of a discontinuance of the campaign in the United States?

THE NEW TEA REGULATIONS IN CANADA.

A circular has been issued to collectors of Customs in Canada containing consolidated instructions regarding adulterated teas, part of which reads as follows:

The following instructions respecting the prohibition of adulterated teas are issued for the guidance of Customs officers, in the place of Memo. No. 954 B. and Memo. No. 998 B., which are hereby cancelled:

1. All teas or goods described as tea in respect of which samples are to be taken for examination or test or which are suspected to be prohibited, shall not be released from Customs control until it is decided that such teas are not prohibited under the Customs laws.

Decision as to the quality of tea presented for entry at the Customs will be rendered by the Department with all practicable despatch.

2. Samples of the following classes of imported teas, when entered for consumption, shall be sent to the Department of Customs at Ottawa to be tested, before such teas shall be released by the collectors, viz.:

(a) All teas from the United States not accompanied by Customs certificates of fitness for consumption in the United States.

(b) All tea dust.

(c) All China green teas costing, when landed in Canada, 14c. per lb. or less.

(d) All other teas costing, when landed in Canada, 12c. per lb or less.

Note.—The cost of consigned teas " is to be estimated at the export price abroad (f.o.b.), with transportation charges added. In the absence of bills of charges, 2c. per lb. may be estimated for freight and charges from the country of growth to Canada.

NATAL TEA INDUSTRY.

A GRATIFYING REPORT.

It will be remembered that the tea taken to the Grahamstown Exhibition by Mr. Hindson, of the firm of W. R. Hindson & Co., Clifton Tea Estates, Nonoti, met with remarkable success, there being a very heavy demand for it at the various kiosks and other places frequented by visitors to the exhibition, while large orders for supplies for the Cape have since been received.

It is gratifying to learn that, as the result of samples of exhibition teas sent to London for valuation and report, Messrs. R. M. Holborn & Sons, one of the oldest-established and largest firms of tea merchants in Mincing Lane, have forwarded most satisfactory reports. One of the members of the Mincing Lane firm reports as follows. "—I have now carefully tasted the samples of Natal teas. They are certainly a long way the best specimens we have yet seen." The firm's detailed report is as follows :—

We have pleasure in sending our present market valuations, also our descriptions of samples of Natal tea received from you, and now return your canisters by post.

No. 7.—Tippy, leafy broken Pekoe, very brisk and good quality; value 8d. to 8½d

No. 19.—Well made. grey leaf Pekoe, excellent quality, with bright infusion. and very pungent; value, 10d.

No. 10—Orange Pekoe, golden tipped and well twisted leaf, bright infusion, fine quality, pungent liquor; value, 1s. to 1s. 1d.

No. 9.—Broken Orange Pekoe, bright, golden-tip, fine pungent liquor, with bright infusion; value. 1s. 4d.

When it is stated that at the date of these reports Indian teas were only averaging 9d per lb. and Ceylons 8d. in public sales, and that Messrs. Hindson's teas were valued against all going, it will be recognised that the valuations are eminently encouraging. It has been asked from time to time whether in Natal we cannot obtain high-class teas approximating to some of the fancy kinds that were exhibited at the last Durban July Show. It will be seen by the foregoing that teas of as good a quality as can be desired are to be obtained in the Colony, and particularly if people will pay for these better qualities prices analogous to those they pay for the best imported article. The fact is that Natalians have been favoured in having tea grown at their own doors and supplied at a very cheap rate, and have perhaps grown accustomed to using lower grade teas because of their cheapness; whereas if they paid, say, 2s. 6d. per lb., which is not so much as is asked for some of the best imported blends, they would get a superior tea, and one grown within the Colony. It is, at any rate, satisfactory to find our tea-growers not only paying attention to the quality of their teas, but offering them to the public in an attractive style. Such a canister as the sample we have before us can scarcely fail to commend itself to purchasers. It may be mentioned that the tea can also be obtained in lead packets and in boxes.—*Natal Mercury*, March 10.

JAPAN TEA IN THE UNITED STATES.

A correspondent writes to the *Planter*:—A short description furnished me by a friend, a wholesale tea merchant, of the China (Oolong) and Japan teas sold in America and Australia may prove of interest to your readers, as it will afford them an insight into the various qualities of tea sold in those markets. China Oolong teas are subdivided into Ankois, Amoys, Foochows, Formosas, Sasyune and Pekoe Oolongs grading from lowest to highest in the order named.

Ankoi Oolong.—Is a doubtful species of the genus tea, and is said to be prepared solely from the leaves of a shrub closely resembling, but widely distinct from those of the true tea plant. [Here is a *fact* admitted by the wholesale tea merchant himself]. The leaf is rough and coarse, reddish-black in colour, indifferently prepared and ragged in general appearance, while the liquor is dark brown, oily or earthy in flavour, and bitterly astringent to the taste. It is generally used for mixing with low-grade Amoys to which it imparts a wild, rank or weedy flavour, and should be avoided by the dealer altogether. (Unfortunately, however, it is not).

Amoy Oolongs.—Embrace Kokew, Mohea, and Ningyong Oolong teas, and are fairly good teas for blending purposes, many of them drawing and drinking exceedingly well in the cup. The leaf while large and somewhat coarse in appearance, is well prepared as a rule, while the liquor is clear, strong and frequently pungent. The poorer grades, however, possess a wild or herby flavour, strongly objected to by the majority of tea consumers.

Foochow Oolong.—Ranks among the best of the black teas of China. The leaf of the finer grades being black and silky in appearance, rich and mellow in liquor and fragrant in flavour, while the medium and lower grades are somewhat larger and looser in make, they possess splendid cup qualities, making the most suitable foundation for all blends in this country, being useful and serviceable for the purpose.

Formosa Oolong.—Is unique in leaf, liquor and flavour, differing widely in character and flavour from the former varieties. It possesses a rich, fragrant aroma, the leaf being evenly curled and crapy in texture, and imparts tone and character to any combination in which they may be introduced.

Saryune and Pekoe Oolongs.—Are very rare sorts in the American and Australian markets. The latter derives its trade name from being liberally sprinkled with Pekoe-tips. They are somewhat large and bold in style, evenly curled and pleasing in appearance. The infusion is dark-brown in colour, heavy and full in body and very fragrant in flavour.

In colour, flavour and character, Japan teas are totally distinct from any and all other varieties of tea known to commerce. They are divided into Panfired, Sundried and Basket-fired teas, and nibs, but are frequently converted into Oolongs, Pekoes, Congous, &c.

Panfired Japan.—Is a medium sized green-leaf tea, well curled and presenting an unbroken appearance It yields a bright, clear liquor which remains unchanged in colour until quite cold, and possesses a flavour delicate but fragrant in odour. The medium grades, however, are rougher in make, darker in liquor and duller in flavour, while the commoner ones are coarse and unsightly in style, varying in colour and somewhat brassy or metallic in flavour.

Sundried Japan.—Derive their tradename from being dried in the sun before firing, in order to fix their colour more permanently. The leaf is of an olive-green colour, small and compactly curled, and the liquor what is known as "toasty" in flavour, owing to their thorough fermentation before firing. The lower grades range from a yellowish to a dull-green in colour, indifferently made and often "fishy" in taste, from the use of fish manure in cultivating. (I think my friend the merchant has made a wrong deduction here, but I give his remark as made in his letter).

Basket-fired Japan.—Is so called from being cured in baskets over a slow fire. The finer grades are long, dark and exceedingly well twisted or curled, clear and bright in the infusion and mellow or mealy in flavour, the latter quality making them a very valuable sort for blending with Oolong in the proportion of one part to four of Oolong, or almost any variety into which they are introduced.

Japan Nibs.—Are composed of the largest and oldest leaves of the foregoing sorts and bear the same relation to Japan teas that Twankay does to green teas. In the cheaper and lower-grade blends they make an excellent addition by imparting strength and fullness to the combination, particularly when separated from the higher grades of Japan teas.

Japan Oolongs.—Pekoes, Congous, &c., differ only from the regular Japan teas in make, and from being prepared from the same leaf they naturally possess the same general characteristics and cup qualities, but are not produced in any appreciable quantities.

The above descriptions of the China and Japan teas, coming from one engaged in the trade, are of value to us, as they furnish us with information as to certain of the kinds of tea we have to compete with in the American and Australian markets. There are, of course, numerous other classes to which I have not referred, but which I may have occasion to allude to in a future issue.

TEA IN 1898-99.

The following are excerpts from Messrs. Geo. White & Co.'s Annual India, Ceylon and Java tea report, dated 23*rd March* 1899.

The fear of excessive supplies from the producing countries had a detrimental influence on the market during the first half of the season now drawing to a close, while the quiet state of trade generally prevalent in the United Kingdom and also on the Continent did not encourage buyers to stock beyond immediate requirements. Towards the end of 1898 it become gradually apparent that, owing to various causes, the amount of the leaf forthcoming would not be more than could be easily dealt with, and a reaction set in, a welcome rise in the value of all lower grades which had been much depressed taking place. This has been further accentuated in the past month, so that many Companies will be enabled to shew a better result than was at one time anticipated.

India:—In their original estimate, the Indian Tea Association of Calcutta computed the crop of 1898 at about 158½ million lbs, of which 140½ million lbs. would be available for Great Britain. As time progressed however, it seemed likely that these figures would not be realised, principally due to the unpropitious weather experienced in some districts, notably Cachar and Sylhet, where want of rain was experienced, and also to larger consignments from Calcutta to Bombay, America, etc. Early in September the probable quantity for this country was reduced to 136½ million lbs., while telegrams to the 15th inst. gave the entries for export from Calcutta to the United Kingdom as rather over 135¼ million lbs, compared with the total of 134 million lbs. despatched in 1897-8. If, therefore, the imports from South India (say 3¼ million lbs.) be taken as about counter-balancing the "overside" shipments to other countries, and which are not accounted for in the London Returns, only about one and a quarter million lbs. will come here for actual use in excess of that received during the previous season. Although with few exceptions quality at first was not generally very attractive, considerable improvement was shewn later on in Darjeelings and Assams, from which districts many choice invoices were received throughout, the latter perhaps sending more uniformly good Teas. The Dooars produced some very saleable parcels, particularly after the first two or three months. Cachars and Sylhets in the early part suffered from the effects of continued dry weather, but afterwards they were of a serviceable character. Kangras for the most part were disappointing, while a large proportion of the South

India growths at first lacked strength, but recent arrivals have been fuller in cup.

During the summer and early autumn prices for common to fair grades of Pekoe Souchongs and Pekoes were about at the lowest point recorded, the former selling down to 5d. per lb. and the latter 5½d. per lb This had the effect of drawing the attention of Continental buyers to them, and they competed with the home dealers more largely than hitherto for parcels suitable to their needs, so that deliveries shewed a steadily increasing trade, those from the London Bonded Warehouses for the eight months from 1st July, 1898, being 96,365,000 lbs., versus 85,837,000 lbs., while the stock at the end of February stood at 59,460,000 lbs., against 64,080,000 lbs. on the same date of 1898.

From 1st July, 1898, to the close of last month the average for 948,000 packages sold in London on garden account was 8¾d. per lb. opposed to 8⅞d. per lb. for 927,000 packages, and 9⅜d. per lb. for 890,000 packages in the corresponding intervals of 1897-8 and 1896 7. High rates of exchange all through the season, unfavourable weather for manufacture and drought in some parts, further handicapped the industry, so that the upward turn in the market lately was an immense relief in many quarters.

Ceylon.—The 1898 crop was on the whole of a useful description and about up to the average. There was at times an absence of really fine invoices and in some months the majority of the teas were wanting in fulness of liquor though flavour was very desirable in others, most market in October. Partly on account of the low quotations current for common to fair Indian leaf teas, Ceylons of a similar kind were abnormally cheap here during last summer, fair Pekoe Souchongs bringing 5½d. per lb. and Pekoes 5½d. per lb, and subsequently these low prices induced buyers both at home and abroad to take them more freely. Deliveries were unsatisfactory in contradistinction to those of the preceding year, being for the twelve months 93,489,000 lbs., whereas in 1897 they were 95,172,000 lbs. Owing in some measure however to the larger clearances from Colombo to other markets than Great Britain, especially Australia and Russia, there was a shortage for this country, shipments being 96,399,000 lbs. versus 98,998,000 lbs. in 1897. The entire output from the Island for 1898 was 120¼ million lbs. contrasted with 116 million lbs. in 1897, and 108 million lbs. in 1896, so that the increase in the exports to various ports outside the United Kingdom represents 7 million lbs., which is an important feature.

For the twelve months the following passed through the London Auction Room:—

1898.	1897.	1896.
1,108,000 packages, (Average, 7⅞d. per lb)	1,138,000 packages. (Average, barely 8d. per lb.)	1,049,000 packages. (Average, 8¼d. per lb.)

The slightly smaller amount disposed of here (attributable to the reasons mentioned above) therefore produced nearly the same result as in 1897, but planters had still to reckon with an adverse rate of exchange, while freights as a rule were also against them.

Java.—Importations were rather larger, the public sales from 1st July, 1898, to the 28th ult. including 30,200 packages, averaging 7d. per lb., whereas in the two former seasons they comprised 24,900 packages bringing 6⅞d per lb., and 25,460 packages 7d. per lb. respectively. It is evident that much care was bestowed on manufacture, the style of leaf being generally good, while often very attractive parcels were received from some Estates. No doubt the benefit arising from the use of seed from India and Ceylon is becoming more manifest, and the teas are consequently occupying a higher position on this market than formerly.

Prospects.—Chiefly owing to increased deliveries of Indian, and a falling off in the supply of Ceylon, stocks are likely to be abnormally low by the end of June, and prospects for the coming season look favourable from a producer's point of view; but it must be borne in mind, and we venture to give it as a word of caution to planters both in India and Ceylon, that encouraged by the enhanced prices of common grades since the turn of the year they must not all go in for coarse plucking, otherwise there will be an undue proportion of that class, which will not only glut the market, but lead to a still lower average than was current for some periods in 1898. Besides, China may be induced to send more to the United Kingdom than in the past twelve months.

With regard to the future, there is at present little information as to the supplies we may expect from India during 1899, though a moderate increase may be looked for, while from Ceylon estimates point to their being smaller, brought about chiefly by larger direct shipments to Australia, America, Asia, Russia, &c., occasioned by increased facilities for conveyance. In all probability therefore from both countries together, the important quantity of say 40 to 45 million lbs. will be diverted from this centre. That the general position should be thus strengthened must be very gratifying to those who, for a long while and under many difficulties, have been labouring to foster the use of British-grown tea in other quarters than Great Britain, and the success already achieved will, no doubt, stimulate them to fresh efforts.

It is to be hoped that with smaller receipts we may see a corresponding appreciation in values, over supply has been the bane of the London Market for some years, and it would be exhilarating to many if a change "came o'er the scene" and a higher range of prices should be permanently established.

Manufacture.—In the majority of instances this appears to have received full attention from planters and on the whole, the green leaf seems to have been carefully withered and well rolled. There were indications however, at times that the firing in the "driers" had been executed too quickly and at an excessive temperature, thus destroying the flavour of the leaf operated upon, and imparting an odour foreign to tea. To this some attribute the so-called "cheesiness," which has given much trouble to sellers and dissatisfaction to buyers more or less throughout the season, particularly in the earlier months. That it was caused by the use of unsuitable wood could not always be the case, as many of the complaints have arisen with regard to parcels in metal packages.

Cultivation.—On some Estates where both yield and quality have fallen off, apparently from deterioration of the soil, it has been proved by experience that the planting of "Sau" trees has had a beneficial effect, as they do not give too much shade and are said to impart nitrogen in considerable extent to their surroundings. It might be well to try this on gardens requiring such treatment, whether in India or Ceylon, as an alternative to artificial manures when not easily procurable.

Plucking.—It is probable that the high rates now ruling for Teas under 8d. per lb. will induce the picking of large quantities of inferior leaf, at all events until requirements have been overtaken, so that the proportion of fine will be small. Some of the Darjeeling and a few of the Assam concerns, as well as those in the high districts of Ceylon where large flushes cannot be obtained, may however do better by going in for choice quality, for which there is always a demand.

Size of Breaks.—No alteration has been made in the limits for large breaks since last year which stand as under, viz.:—

India—30 Chests, 30 Half-Chests, 50 Boxes. Ceylon—18 Chests, 24 Half-Chests, 40 Boxes.

Assortment.—Lots of lesser size are sold separately at the close of the auctions.

Fair sized breaks have in most instances come to hand from India during the past season, and consequently there have not been so many complaints from buyers of the succession of small invoices from the same estate despatched at short intervals. Many Ceylon Garden Managers, however, have apparently not found it practicable to make the different lines of a marketable size though no doubt in course of time this will be remedied.

The following continues to be a desirable assortment to adopt, say:—A Broken Pekoe of 30 chests or more; a good Pekoe of 50 chests or over; a Pekoe Souchong of 70 chests or upwards, with a break of Broken Tea or Pekoe Fannings. Parcels containing dust are not readily saleable and therefore this should be sifted out and packed by itself, for which purpose some of the patent packages now in vogue might be utilized so as to avoid leakage on the voyage resulting in loss of weight which often occurs with country made chests. The exception to the foregoing is when a tippy Broken Orange Pekoe or Orange Pekoe can be made, as these when really fine usually command high figures, whether from India or Ceylon. Should the quantity of leaf available for this not suffice for a full sized break in Chests it might be packed in Half-Chests.

Analysis of Crop from India.

Assam.—The quality from the greater part of this district has been above the average, many of the shipments being of very desirable character, whilst those possessing full autumn flavour were much appreciated. On the other hand the outturn from some estates was for the most part disappointing. Owing to a large area coming into bearing the yield was 62 million lbs., contrasted with 58 and 59½ million lbs. respectively in the two preceding seasons. Acreage under tea—178,000 acres.

Cachar and Sylhet.—In consequence of adverse climatic influences and excessive drought in the early part of the year, the crop was much interfered with both as regards quantity and quality, though later manufacture proved rather better and received benefit from the enhanced values ruling in February and March. The total manufactured was 45 million lbs. opposed to 46¼, and 45½ million lbs, in 1897 and 1896. Acreage under tea—133,000 acres.

Darjeeling and Terai.—During some parts of the season exceptionally choice invoices were despatched, though at others shipments were unsatisfactory. The general result was about the same as last year, but not up to that of 1896. For three seasons 11¼, 11 and 11½ million lbs. were sent away. Acreage under tea—55,000 acres.

Dooars.—Though rather poor at first the crop was an average one, and 7⅝d. per lb. was obtained, or the same as for the two previous seasons. Totals despatched from the gardens during the past three seasons were 25¾. 24 and 22 million lbs. respectively. Acreage under tea—65,000 acres.

Chittagong.—Fairly useful teas were received from this district, though they call for no special comment. The output was smaller, viz.: 887,000 lbs against 1 million lbs. in each of the two prior years. Acreage under tea—4,000 acres.

Kangra, Dera Doon & Kumaon.—As a rule quality was unattractive and a considerable portion was sold locally. The quantity made was about the same as for the last two years, viz.: 4 million lbs. Acreage under tea—18,000 acres.

Travancore and S. India.—Delicate flavoured invoices were occasionally received from the Neilgherries and Wynaad, which met with considerable attention, but for the most part arrivals were of an ordinary description. The bulk, however, as usual, came from Travancore, and quality was rather below the average until the turn of the year when some improvement was noticeable, which, combined with a better market, raised the February average to 7⅝d., whereas in August last it was only 6d. per lb. The amount sent to this country was about 3¼, against say, 3 and 2¾ in the foregoing years. Acreage under tea—21,000 acres.

DISTRICT ASSOCIATION.

SHEVAROY.

Proceedings of a Quarterly General Meeting of the Shevaroy Planters' Association, held in the Victoria Rooms at 2 p.m., on Monday 10th April 1899.—PRESENT: Messrs. Rev. M. Andersen, C. Dickins, Thurston Short, C. Rahm, W. Rahm, C. G. Lechler, *Chairman*; Messrs. C. D. Ryle, F. Short, J. C. Large, E. Dickins, R Gompertz, *Honorary Secretary*.

1. Chairman opened the meeting by informing the members that there would, ordinarily, in future be no Committee Meetings in the months in which the Quarterly General Meetings are held.

2. Chairman then read proceedings of Committee Meeting held on the 6th February and 6th March last. Resolved that the said proceedings be confirmed.

3. The proposed Rules were read, discussed, and slightly altered.

Resolved that the rules as amended be printed and a copy sent to each member of the Association.

4. *Resolved* that this Association entirely approves of the Hon'ble Mr. Hodgson's letter to the Chief Secretary to Government, forwarded with Secretary's Circular of 7th instant, and feel confident that their interests could not be entrusted to abler hands than those of the Planting Member of the Legislative Council of the Government of Madras.

5. *Read* Memo. No. 137 *b. c.*, Public Works Department, Government of Madras, dated 16th March last, enquiring what contribution the Planters were prepared to make towards the construction of a cart road.

Resolved that the Honorary Secretary be requested to reply that until Government informs the Association which road they have decided to construct, the Planters are unable to state what amount they are willing to contribute, at the same time, referring to his letter No. 892 of the 13th March last.

6. *Read* letter dated 4th instant from Mr. deClosets, suggesting that the Planters should consider his proposal to construct a wire tramway. Resolved that the Honorary Secretary be requested to inform Mr. deClosets that the construction of the Ghaut Road by Government is now under consideration and that, therefore, they are unable to entertain his proposal.

Read and *Recorded* the following letters:—

28/U. W. Circular from the Secretary U. P. A. S. I. forwarding copy of a letter from Mr. Green, regarding the importation of lady-birds from Australia.

29/U. W. Circular from Secretary U. P. A. S. I. regarding the supply of Indian tea to H. M.'s Naval Station in New South Wales.

25/27 30/31 U. W. Circulars from the Secretary U. P. A. S. I. regarding the proposed Labour Ordinance.

23/D. Letter and statement from the Deputy Tahsildar, regarding the traffic through the Salem Ghaut Road and the Ahtur and Kadiampattie Roads.

4 G. Letter from the Government of Madras, Public Works Department, requesting to be informed as to what the Planters are prepared to contribute towards the construction of a cart road.

22/P. Letter from the Superintendent of Police informing that the constable has been fined.

24/D. Letter from Mr. deClosets, suggesting a wire tramway in place of a Ghaut Road.

The following papers were laid on the table:—

Proceedings of the Nelliampathy Planters' Association, dated 17th February 1899.

Proceedings of the Wynaad Planters' Association, dated 1st March 1899.

Agricultural Ledgers Nos. 18/19—Oxen and Wild Indigo.

Prevention of leaf disease in Coffee.—Report of a visit to Coorg by John Cameron, F.L.S.

Planting Opinion, 3 copies, dated March 11th, 18th and 25th.

(Signed) C. G. LECHLER, *Chairman.*

YERCAUD, 11*th April* 1899. (,,) R. GOMPERTZ, *Honorary Secretary.*

THE STICK AND THE CRUST.

A stick and a crust of bread. Like the hands of a clock these two articles told the time o' day for nearly a year in a certain man's life. Yet, unlike the hands of a clock, they were not visible at once. When he needed the stick, he had no use for the crust; and when the crust was welcome, he had no further occasion for the stick.

Albeit he was a young fellow of twenty-six, you would be wrong in supposing this stick to have been in the nature of a weapon for attack or defence. In that case the crust and the stick would have harmonised. As it was, they did not. For the stick was a support, not a club.

Now, when a man feels the pressure of eighty or ninety years he is apt to want a travelling companion of that sort; but one in the very heyday of youth, not suffering from any injury and not constitutionally feeble, or malformed, should commonly be able to walk without a stick. And so this young man had always done up to the time when he fell out with the crust and with all that the crust stood for or represented.

His own account of the circumstances runs thus:—"Up to October, 1893, I had been a strong, healthy, and active man. Then I commenced to feel weak and out of sorts. I was heavy, tired, and had no ambition or energy. What had come over me I could not imagine. I had a foul, nasty taste in the mouth and was constantly spitting up a thick, dirty phlegm. My appetite left me, and what little I ate lay on my stomach like lead, causing me great pain about the chest. A short, distressing cough settled upon me and troubled me day and night

"At night my sleep was disturbed and broken with night sweats and frightful dreams. I had great pain at the left side around the heart, and my breathing was hurried and short. Next I began to spit blood and was greatly alarmed at it. I wasted away rapidly, losing over a stone weight in a month, and became so weak that I was unable to rise on my feet without assistance.

"Although only a young man of twenty-six I was *obliged to hobble about with a stick*, and could walk but a short distance even at that. Worried and anxious I attended the York County Hospital, where the doctors sounded me and *said I was in a consumption.*

Here we have another of the serious and often fatal mistakes that are made in cases like this. Misled by symptoms which in some respects resemble those of consumption, medical men hastily decide that the lungs are affected, treat the patient perfunctorily for the hopeless disease he is *not afflicted with*, and leave the result

to chance. Hence he often dies of dyspepsia and its complications—his true disease—which, unlike consumption, is easily curable by the remedy our friend finally employed.

"They gave me cod-liver oil," he continued, "and medicines, but I got no better. Indeed, I was so low-spirited and miserable I didn't care what became of me. As time passed I grew weaker and weaker."

"After I had endured ten months of this, Mr. R. W. Dickinson, the chemist in Walmgate, advised me to try Mother Seigel's Syrup. After taking it a few days I felt much better, my appetite reviving and my food giving me no pain. I continued to take this medicine only, and soon the cough and breathing trouble left me and I began to gain strength and flesh. When I had taken three bottles, I was as strong as ever, and could eat and enjoy even a *dry crust*. I have since had good health. You are at liberty to publish this letter and refer all inquirers to me. (Signed) Isaiah Lewis, 124, Walmgate, York, April 8th, 1894."

If the reader wonders how a man could suffer so much, become so emaciated and weak, and be pushed so near the grave's edge through what is sometimes flippantly called "mere indigestion," he has yet to learn that the digestion is the arbiter of life and death. The "crust" (food), enjoyed and digested, means life and strength. Rejected it means the "stick," to supplement swift-coming weakness; and then the *prone position*, when help is vain. Mother Seigel's Syrup enabled Mr. Lewis to substitute the *crust for the stick*. It cured his dyspepsia.

MARKET REPORT.

COFFEE.

The *London Commercial Record* of 24th ult. states:—During the week supplies at auction have been heavy, and the sales so numerous that some have had to be postponed daily. For choice descriptions demand has been good and prices fully maintained, but the bulk of the quantity offered has been unattractive and a large proportion had to be withdrawn. The greater part of the East India continues to be of the poor quality which has been a characteristic of the present crop, and where sales have been made prices shew a further decline of fully 2s to 3s per cwt.; any samples, however, suitable for the home trade have met good competition and sold well. "Futures" have been dull, and closing prices barely maintained last week's value, viz.:—

London	... Santos ... July delivery	...	29s 3d
New York	... No. 7 Rio... „ „	...	5.20 cents
Hamburg	... Santos ... „ „	...	29½ pf.
Havre	... Santos ... „ „	...	35½ francs
Holland	... Good ordinary Java ...	...	27 cents.

Imports, Deliveries and Stock of Coffee in London are as follows:—

	Stock.		Imports.

TEA.

China.—A quiet trade is passing in Congous at the rates ruling during the past few weeks, the market being devoid of any special feature, except it be that Green teas are a shade dearer. 4,440 packages have been offered at auction since our last issue, a small proportion selling at 7¾d for new make Congous, 8d for Paklin, 7½d for Souchong, 8d for scented Caper, and 1s per lb. for Foochow scented Orange Pekoe; Moyune Green Gunpowder common to fine 5d to 1s 5d, Imperial 4⅜d to 6½d, Young Hyson 4½d to 7⅛d, Hyson 3½d to 5⅝d, Sow Mee 5¾d to 1s 3¾d, and Foong Mee 8¼d to 1s 1¼d per lb.

Indian.—Public auctions totalled 30,700 packages against 32,600 packages last week, and 33,800 packages at this period in 1898.

There was again spirited bidding for ordinary to fair Pekoe Souchongs and Pekoes, prices ruling very firm to rather dearer, the competition being at times so strong that quotations for the two kinds showed very slight difference. More attention was also occasionally given to the grades above, particularly Pekoes, which somewhat hardened in value. Over 10d per lb., however, the enquiry was limited, and a good many lots were withdrawn owing to comparatively low offers.

A considerable quantity of "last of the season" iuvoices, some of the recent ones being very brown and mixed in appearance, have been disposed of and supplies must now be sensibly curtailed. It is proposed that after Easter sales shall be held only on Wednesdays.

For 25,000 packages on garden account 9½d per lb. was realised, compared with 8¾d per lb. for 24,600 packages and 8¼d per lb. for 22,000 packages in the two preceding years.

Ceylon.—The quantity was lighter, comprising 21,000 packages, versus 25,500 pkgs. on the 14th inst., and 19,800 pkgs. a year ago.

A strong demand prevailed for leafy and broken sorts for price, common Pekoe Souchongs fetching 7¼d per lb. Fair to medium Pekoes were also a shade higher, but Broken Pekoes were irregular though on the whole they did not mark much change. The few fine parcels were well supported, the following being among the best B.O. Pekoes:—Henfold 1s 6¾d, Valamaly 1s 4¼d, Ingestro 1s 4d, Troup and Warleigh 1s 3¼d, and Glenlyon 1s 2¾d per lb.

The average is 8⅞d per lb. On the 16th inst. it stood at 8¾d per lb., and 7½d per lb. in 1898.

Java.—Slightly over 1,700 packages passed the hammer. Most of the favorite marks were represented and met with a good reception, the tendency for the lower lines being still against buyers.

Deliveries.—The clearances of all tea (on which duty has been paid) from the London warehouses, as per official returns, were:—

From 1st to 21st March, 1899 ... ... *16,983,799 lbs.
„ „ 1898 ... ... 11,816,632 „

* This includes one specially large payment made in advance on the 20th inst., but the delivery of the Tea will be gradual.

During the week the following have been printed for sale by public auction:—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offered. Pkgs.
India	28,348	2,393	30,741
Ceylon	19,811	1,189	21,000
Java	1,625	107	1,732
Total ...	49,784	3,689	53,473

Also 264 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated March 24th, 1899, says:

QUANTITY BROUGHT TO AUCTION IN LONDON
From 1st June to Date.

	Indian.	Ceylon.	Java.
1898-1899.	1,435,836 pkgs.	923,648 pkgs.	38,463 pkgs.
1897-1898.	1,400,521 „	975,605 „	35,534 „

31,994 pkgs. Indian
21,242 „ Ceylon
1,732 „ Java
} Total 54,968 packages were offered in public auction this week.

The total outturn of the Indian crop for the season 1898 was only about 4½ million pounds above that of 1897 and 1896. Assam and Dooars were slightly ahead, while Sylhet and Cachar were a little behind owing to the unfavourable weather in these districts. Travancore is not included, but the exports during 1898 do not appear to give a very heavy increase.

Indian. The competition for Teas up to 7½d. was if anything more pronounced, leading to a further slight advance; while Teas a little over this figure seem now to be more enquired for. The following averages are worthy of note:—"Poobong," 1/6½; "Amal T Co Moondakotee" and "Nagri," 1/4¾ and 1/3½ respectively; "Titadimoro," 1/2½.

Ceylon. The advance in the lower grades, which commenced with Teas under 7d. has now extended to medium kinds, which are commanding better rates, competition for the lower grades being, however, the most pronounced. Teas over about 9d. per lb. continue unaltered, fair Broken Pekoes still selling with much irregularity, and in many cases shewing remarkable values.

Average for week 8·80d., against 7·22d. same week 1898.

Ceylon Tea sold on Garden Account, 1st Jan. to date 1899, 245,297 pkgs., av., 8·34d. 1898, 270,209 pkgs., av., 7·67d.

		1899.	1898.	1897.	1896.
Pekoe Soug.	(Ordinary leaf; fair liquor)	7½d.	5⅝d.	6¼d.	6d.
Pekoe	(Ordinary leaf, little twist; fair liquor)	8½d.	6½d.	7½d.	7¼d.
Pekoe Soug.	(Rather bold leaf; indifferent liquor)	7d.	4½d.	5d.	5d.
Pekoe	(Somewhat bold leaf; indifferent liquor)	7½d.	5d.	5⅝d.	5¼d.

Java. With animated bidding prices showed fully a halfpenny advance on all Teas up to 7½d., other grades realising firm prices. The rise from the lowest point in common whole leaf Tea is now almost 50 per cent.

Bank Rate 3 per cent. Exchange on London three months sight:—Calcutta 1/4 5/32. Colombo 1/4 5/32.

COCOA.

Much more moderate offerings were submitted for public competition at Tuesday's auctions than were exposed in the previous week, the total being only 5,431 bags contrasted with 11,430 bags. The opening tone was slow, but as the sales progressed competition became more general, and values on the whole were fairly maintained. Of 1,316 bags Trinidad offered 640 bags sold at barely valuations, fine red 75s to 76s, good fair 73s, weathered 68s, and common dark and broken 60s 6d to 66s 6d. 2,483 bags Grenada brought forward and 2,220 bags disposed of at 70s 6d to 72s for good fair to good red, and 68s to 69s 6d for ordinary to fair, being quite full up. 409 bags Dominica nearly all sold at a slight advance, 69s 6d to 70s for fine and 67s to 68s for fair to good. 60 bags St. Lucia partly changed hands at 67s 6d to 68s 34 bags Surinam were quitted at 68s 6d to 71s. Offerings of Ceylon consisted of 1,129 bags, but enquiry was very poor, and only 150 bags sold in the room at 70s to 75s for fair to good collected, and at 70s per cwt. for fair Native. Privately 450 bags Guayaquil sold at 69s to 70s for grey Caraquez, and some quantity of collected Ceylon at auctions' rates.

Import, Home Consumption, Export and Stock of Cocoa in London are as follows:—

PEPPER.

Black.—The market is quiet, but on the whole steady, with a firmer tone at the close. On the spot sales of fair Singapore have been made at 5 3/16d, and for arrival 200 tons are reported sold, viz., March-May and April-June at 5⅜d to 5 7/16d; May-July at 5⅜d to 5½d, and June-August at 5½d to 5 9/16d.

Auctions on Wednesday included only 5 bags Ceylon, which were bought in at 6d per lb.

White.—Is quiet, and little or nothing reported done on the spot For arrival 100 tons have been sold, viz., Singapore, February-March shipment at 8½d, April-June at 8½d, and May-July and June-August at 8⅝d; of Penang, no sales reported.

At public sale on the 23rd inst., 20 cases 50 bags Singapore comprised the whole of the selection, and these were bought in at 9½d to 11d per lb.

London, March 24 firm.—Of Black. 50 tons Singapore June-August shipment sold at 5 9/16d, and buyers. Of white, 30 to 40 tons Singapore sold, viz., May-July and June-August 8¾d per lb.

Tellicherry to arrive per April-May steamer has sold in Humburg at 47s per cwt. c.i.f. delivered weights.

GINGER.

Cochin again suffered a material decline, and even then buyers did not appear anxious to stock. 218 cases 204 bags were brought forward and 81 cases 54 bags sold as follows:—bold, some medium, rather roughly cut and scraped 75s, medium partly bold ditto 52s 6d, medium and small ditto 34s 6d, small ditto 30s to 31s, small cut, wormy and mouldy, 25s, small washed brown plump 24s, good medium and small washed rough 23s, and good cuttings 17s per cwt.

March 24.—Calicut rough has sold to arrive per April-May steamer at 21s to 20 9d per cwt c.i.f.

Jamaica.—362 barrels, &c., offered and about 150 pkgs. sold—bold hard plump brown 88s, medium and bold washed 82s 6d, good medium brown 74s 6d to 75s, fair dark 67s to 68s 6d, and ordinary to good ordinary washed 57s to 64s 6d per cwt., being a shade in buyer's favor.

CINNAMON.

1 bale Ceylon quill sold at 9½d. whilst 23 bags bark retired at 3¾d 33 bales Tellicherry were bought in at 9½d and 120 bags Ceylon chips at 4d per lb.

CINCHONA.

The *B. & C. Druggist* says:—The result of to-day's bark auctions in Amsterdam, which has probably excited more interest than have any other auctions for a good many years, is an advance in the unit from 6.7 cents at the last auction to 10.9 cents per ½ kilo., that is to say from between 1⅛d and 1¼d. to slightly under 2d. per English pound. Out of 824,880 ozs of quinine in bark form offered, some 731,255 ozs. were sold, about a fourth of it previous to the auction. Out of 6,846 packages put up, 6.215 were sold. The manufacturers' bark ranged from 10 to 111 cents and druggists' bark from 14 to 183 cents The tone of the auctions was quiet. We give below the amount of the purchases of the various buyers stated in tons, the table below only covering the sales in auction.

English and American Quinine factories (principally).	Brunswick factory.	Mannheim and Amsterdam factories.	Frankfort and Stuttgart factories.	Miscellaneous buyers.	Total sold.	Bought in or sold previously.	Total offered.
Tons.	Tons.	Tons.	Tons.	Tons.	Tons.	Tons.	Tons.
5.887	4.462	3.464	2.910	3.628	20.331	3·239	23.570

The Amsterdam market is described as in a very excited state, and in London there have been sales at 2*d.* per unit and over.

CINCHONA BARK.

At Amsterdam yesterday 6,850 packages Java were brought to the hammer, analysing 5.26 per cent. for the manufacturing portion. Demand was extremely active, and prices opened with 11.50 cents paid (against 6.70 cents at the previous auctions), falling to 10 cents but subsequently advancing to 13 cents, the average for the whole sale being 10 90 cents. The catalogues were nearly all cleared.

QUININE.

Since our last the market has exhibited much excitement, and a very large business has been transacted, resulting in a further remarkable advance in value. On the spot sales of HB and B&S have been made at 1s 5⅞d up to 1s 9d, April delivery at 1s 6d up to 1s 9¼d, May at 1s 6¼d up to 1s to 9½d, June at 1s 6⅜d, up to 1s 9⅝d, and August at 1s 6⅝d, up to 1s 10d. The sales and re-sales are estimated at between 500.000 to 600,000 ozs. There has been so much excitement in this market that business in other staples has been materially interfered with during the past week.

The result of the Bark Sales in Holland yesterday (reported above) were looked upon as somewhat disappointing, and the market was quiet at the finish at ½d below the top point.

Of other brands. sales of Amsterdam have been made up to 1s 8d May delivery, Gold and Silver at 1s 7⅞d May delivery, and Zimmer on the spot at 1s 7¼d.

The closing prices yesterday for HB and B&S were as follows:—

Spot ...	...	..	...	1s 8⅝d
May ...	...	...	...	1s 9d
June ...	..	...	...	1s 9¼d
August	...	...	...	1s 9⅜d

The *Chemist & Druggist* reported on 23rd ult.:—"The Quinine Crisis has not yet come. Speculation this week has taken the price to 1*s.* 9½*d.* per oz. for May delivery, and 1*s.* 10*d.* for August. Exactly the same tone prevails on the Amsterdam cinchona-market, where the equivalent of a 12c. unit has been paid privately for manufacturing-bark. When the sales opened there to-day it became known that the manufacturers had decided to stand out, which they did for a time; but outsiders came in and paid an 11c. unit for the first string of bark (which was analytically overstated to the extent of a unit in the percentage). By-and-by the makers came in and the price rose to 12c. and 13c., with an average of 11c. Buying of quinine recommenced in London early in the day, but holders are firm, and the general expectation is that 2*s.* per oz. will be paid for quinine by Saturday. The unit is about double what it was a month ago, and quinine sulphate in the bark at 2½*d* per unit costs the makers 1*s.* 3*d* per oz., to which has to be added cost of manufacturing and other charges, variously estimated at 4*d.* to 6*d.* per oz., so that 2*s.* quinine is nearly an actuality, whatever price the makers may settle on to-night. The cinchona-sales in London next week will be fairly heavy, but much of the bark is of low percentage."

(Average for all India 9·50d.) *March 24th.*

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N. B.—Remittance, should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday the 28th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Coorg.

Polli Betta, *19th April.*—Blossom showers had been very favourable, but a regular deluge descended on open blossom, and in some cases hail. *Rain* has been continuing ever since every afternoon. It is an entirely new experience, and no one can foretell what the end of it all is going to be. Some manuring going on. *Estates* appear to be amply provided with slack season gangs. *Health*—Generally good.

SOUTH INDIAN TEA.

In the annual report of the Central Travancore Planters' Association, published on another page, reference is made to the fact that from Travancore alone in South India have contributions been made in support of the campaign of the Indian Tea Association. The Honorary Secretary evidently thinks that other Associations in the South are blameworthy in this respect, and he throws out a hint that they should mend their ways. It by no means follows, however, that they will take the same view. A few months ago there might have been a fair chance of bringing them round to the opinion that the Central Travancore P. A. has consistently acted upon. But now, when the whole plan of campaign is likely to be altered, it does not seem likely that new recruits will volunteer. For, to us at least, the new plan seems inferior to the old. It has none of its advantages, though it perhaps offers the single advantage of less expenditure; it has moreover the grave disadvantage that it amounts to a swopping of horses in mid stream. If in fact, the work of Messrs. Blechynden and Mackenzie, or either of them, in America,

is summarily discontinued, it is more than probable that money already spent will prove to have been wasted. A continuance of these gentlemen's labours for a few years would doubtless cause good results to flow in, as they have already begun to do. But a discontinuance at the very time when those interested in Japan Teas are making special efforts to push these into the American and Canadian markets, does not appear to us wise. It is a premature change of policy, and may have much the same effect as a frost on the budding trade in Indian Teas in America.

Then, too, there is another aspect of this question that must not be overlooked. Hitherto, Ceylon and India have decided to range themselves side by side as allies—first against China, now against China and Japan. Will the alliance continue? It seems doubtful. In like manner it is open to doubt whether an alliance between Northern and Southern India would prove enduring, and even whether it would be to the benefit of the two parties. The name "Indian Tea" is as misleading as any name could well be. There are even wider varieties in Indian than in China teas; to build up a demand on the strength of pungent Darjilings and endeavour to meet it with coloury Travancores or Nilgiris, would be not only unwise but dishonest. Even in the North there is a range of values from, say, 5*d*. (excluding dust) to anything you please. There is a wide variety of *character* also; yet, speaking generally, there is at least a greater similarity in value between the teas of the North than between them and the teas of the South Here we have a majority of low to medium qualities, the index pointing more towards the low than the medium The teas of the South, except when used solely for blending purposes, should cater for a different market from that at which Darjilings and Assams aim. To lump the whole lot together, call them "Indian Teas," advertise them freely and try to push them as all members of one family, would certainly be possible, but for our own part we should prefer to see South Indian Teas pushed separately. Let them stand on their own merits, and enter into friendly competition, not into opposition, with Ceylon and the rest of India. By doing this no doubt some of the advantages resulting from Union would be lost. But it is probable that this would only be anticipating by a few years what must eventually happen. It is in the initial stages of a campaign that union is specially necessary. When once the enemy has been defeated, a scattering in pursuit may become advisable. In the particular case under reference, indeed, we take it as certain that now that China has been defeated, and her tea forces disintegrated, division of the Indian and Ceylon allied forces into section will begin, unless the rivalry of Japan should appear powerful enough to necessitate further concentration of energy.

While writing thus, however, we are constrained to express the opinion that tea planters in South India have shown themselves lacking in enterprise, and have shown themselves in no enviable light. It would be easy for the critic to say that they were lying low, sparing their own pocket, yet ready to avail themselves of the fruits of the enterprise and expenditure of tea planters in the North of India and in Ceylon. That they have not done this intentionally need scarcely be said; but there is certainly some justification for thoughts that they have done it. We should like to see the reproach removed. There is no reason why South Indian tea should not strike out a line of its own, and this without greater expenditure than local planters can afford. There has been no united effort to open out new markets. Even local markets have been neglected, to the extent of having been only cultivated at an absurdly high level of prices. Acting somewhat on the lines of the Coffee-planters who have gone in for co-operation, a few Tea-planters on the Nilgiris and a few in Travancore might band themselves together,—one band for the Nilgiris, one for Travancore—"pool" a certain quantity of their teas, and place them on such markets as the American, Canadian, Russian and German with a view to opening up an increasing consumption in these markets. Divided among several, the risk of initial loss would not be great. The loss itself would probably amount to much less, in proportion to results, than the amount expended by the Indian Tea Association and the Planters' Association of Ceylon in newspaper advertising and in general campaigning operations. Newspaper advertising is no doubt important, it may even be essential to permanent success on the very matter under notice: but for the present we should be inclined to give the preference to practical advertising: a liberal distribution of free samples, and the sale of good teas at fairly low prices until the taste for them has been acquired. It is worthy of note that South Indian teas are at present entirely excluded from one very important branch of trade. Indian teas are sold in Calcutta, where foreign buyers congregate as well as English; Ceylon teas are sold at Colombo under similar conditions, and the trade is developing. *South Indian* teas have no local market for teas for export. Of course they do not compare in *quantity* with Ceylon or Northern India, but though there is no need for local auctions, it would certainly be well not to neglect opportunities to open out new markets, and to let the world know that South Indian tea deserves a share of its attention.

THE MANUFACTURE OF TEA.

A correspondent writes to the *Planter*:—"Looking through the columns of *Planting Opinion* (issue of the 1st inst.), the heading, "Tea, from seed to cup," attracted my attention. Your contemporary has arranged with a *South Indian planter* (the italics are mine) to write a special series of papers on tea cultivation and manufacture, giving practical hints that will serve the beginner and enable him to start tea planting with the teachings of experience before him. What struck me was the announcement that the papers were to be written by a *South Indian* planter. Considering that North-Eastern Indian and Ceylon planters are far more experienced men than their confrérés in the South of India, specially as regards *manufacture*, would it not have been more to the point if we had been informed that some expert from our part of India, or from Ceylon, had engaged to write a series of practical articles for the benefit of his less experienced brethren in the South of India. Although tea was started in Southern India at the same time as it was in Assam and North-Western India, the industry may, in comparison to the latter, be said to be still in its infancy in the former. I look forward with interest to see how my Southern brother will teach 'the young idea how to shoot,' especially regarding manufacture."

We hold to the opinion that what will be most useful here, is an account of the experiences or methods of a man who has grown and manufactured tea in *the South of India*. On point of cultivation, he will speak with local knowledge as to climate, soils, &c., and if in the matter of

manufacture he has something to learn from his brethren in the North they will no doubt teach him, and the lesson will carry more weight, and be more likely to be borne in mind than any *ex cathedrâ* utterance of a tea-maker in Northern India. We hope to begin the promised series of papers early next month, and while we trust they will meet with general approval, it will also be a source of satisfaction to us if they form a basis for discussion and come in for some criticism. The flint and steel of conflicting opinions may then serve to throw light on an important subject.

TEA IN CEYLON.

The *Ceylon Observer* holds that, quite apart from such "unpleasant surprises" as the Government of India's action in closing the mints, Ceylon has a continual war to wage with its rivals. Its efforts to oust China and Japan teas from the best markets must not be relaxed; the superiority of Ceylon teas must be established and maintained. With a view to gauging prospects, apparently, our contemporary lately put certain questions to tea planters in different districts:—What are any drawbacks to making better tea than the average now turned out, in your neighbourhood? Is the jât generally good? or inferior? Is the soil generally poor on estates in your division? Are any estates worn out? Would manuring improve the tea and be profitable, in your opinion? Are factories on the whole deficient in withering room? Are factories on the whole deficient in machinery? or in motive power? Is the labour force sufficient to secure regular cultivation and careful plucking? Has the pruning been too severe, or too frequent? Or has the pruning been too long neglected? Any general remarks on your neighbourhood and its suitableness for tea?

The *Observer* now touches upon replies received from the two "rather out-of-the-way districts" of Rakwana and Morawaka, "whose possibilities in respect of tea are far different from what they were with coffee, which practically depended on one blossoming season—a prolonged drought scorching all the blossom, and too much rain resulting in its running into leaf." We gather that Rakwana holds the London Market (the combination of big buyers, presumably) to be the chief drawback to the manufacture of better tea, declares its average outturn "good stuff" and that, at the price it fetches, it is simply given away, not sold! The jât is generally fair, excluding small patches of China, and although the soil is not of the best, some of the old estates being worn-out, it responds to cultivation, while the shuck fields are little by little struck off. There is no complaint about factories, the labour supply is ample, medium pruning is the rule; and in fact it is thought that only the Kelani Valley Railway with its branch to Ratnapura, is wanted to give this old, and rather inaccessible district a spurt, and enable it to attract settlers by its climate, and its capabilities, not alone for tea, but also for cocoa, cocoanuts, and even coffee, if transport difficulties are overcome. From Morawaka, however, a different story comes, for although its factories are deficient neither in machinery, nor in motive power, they are not generally provided with sufficient withering space. "The pruning, while not severe, has to be pretty frequent to force paying flushes, and that must tell on the bush. Though the district has a sufficient labour force, and is well suited for tea, it is handicapped by land badly opened with insufficient drainage, and planted with poor jâts to the extent of quite one-half. In these circumstances, the tea turned out is naturally poor, and although confidence is expressed in manure, as a means of improving both the quality and the yield, the plea is put forward that the cost would swallow up the profits 'at present prices." It will be interesting to learn what reports are received from the more important tea-growing districts.

COFFEE IN PORTO RICO.

Captain Arthur C. Hansard, whose name will be familiar to some of our readers in Ceylon, Bengal and the Punjaub, sends us an amusing account of how coffee is grown in Porto Rico. We give this below, and may observe here that notwithstanding the low altitude at which some coffee is grown in Porto Rico, Liberian is almost unknown there, only three or four persons having a few trees as a curiosity. The average altitude at which coffee is grown is probably 1,000 to 1,200 feet. Captain Hansard informs us that he knows of none over 1,600 feet, but a good deal is grown at under 400 feet. The average yield, according to a late return, was 4 quintals = say, 400 lbs. per acre. Coffee is not cultivated in Porto Rico: it grows, it is produced; and as to the cost of production no reliable information is obtainable. "Many planters do not keep any books and do not handle their own money." Exports are mainly to Cuba, Germany, France and Spain, and the figures for the last few years are given as follows:—

1893	...	...	...	19,486 tons.
1894	...	...	...	21,172 „
1895	...	...	...	16,884 „
1896	...	...	...	26,000 „
1897	...	...	...	20,672 „

Sales by the planter are, however, made locally, to the merchants in the larger towns, and it is exported on account of the merchant not the planter. In some few instances, small planters may work with local shopkeepers, but in the long run the coffee passes into the merchants' hands, and is by them shipped.

Captain Hansard has sent us small samples, which have not yet come to hand. He states that the finished sample has been through a Gordon pulper, an American washer, and dryer, and a smout (Gordon's) Huller, passing the latter four times. He has no polisher, sorter or grader.

The following is what he writes:—

Coffee Planting in Porto Rico.

(By Captain Arthur C. Hansard.)

The coffee of Porto Rico has always held a very high reputation, but it has a flavour peculiar to itself which makes it somewhat too strong for the taste of people in England. In reference to this I am able to quote the following extract from a letter from a very large firm of dealers:—"For consumption in the United Kingdom the coffee is not suitable, and we strongly advise you to ship to some continental port, where this coffee is much liked." When properly roasted, the liquor is much darker than we are accustomed to in England, being of a deep and rich brown colour. On first arrival few of us take kindly to it, but it seldom happens that anyone stays here more than a week

without going into raptures over it. A gentleman who had lived in the island for three years returned after an absence of twelve months and said he had not had a single cup of good tasting coffee during his absence. This same gentleman met a lady relative to whom he had formerly given some Porto Rican coffee and she said she hoped his coffee was improving, to which he replied that it was growing as quick as could be expected "Oh! but I mean the taste, that other was most horrible stuff." It is perhaps most suited to folks who like their after dinner *café noir*, and it is most highly appreciated throughout Latin Europe and in Germany.

Though there is a new district opening up at the eastern end of the island, the plantations in the old districts are thoroughly worn out, on proper cultivation, entire absence of fertilizers, and gross ignorance of work required, all helping in the decay. Planters, as a rule, own from 500 to 700 acres of land, and of this they manage to plant from 150 to 200 acres. I am quite unable to express any opinion as to what is taken into consideration in selecting land either for the estate or the planting; elevation, locality, aspect, and direction or force of wind all seem equally ignored, and thus one often sees estates as low as 350 feet above sea level, and I am of opinion that few, if any, rise above 2,000 feet, whilst a fair average would perhaps be 1,000 or 1,200 feet. In erecting a dwelling-house proximity to water is certainly sometimes, but very rarely, studied, and it is a frequent sight to see a house on the top of a ridge with water in the gully far away and the poor unfortunate servant struggling up the hill with a paraffin tin half full of water.

So far I have failed to fall in with any man having a useful practical experience, whilst theory is simply non-existent. If a man manages for himself, well and good; he does so to the best of his ability; but the general run have a man in charge who enjoys the courtesy-title of "Mayordomo." These are, as a rule, of such a low class that their services are worth little more than those of a labourer, and a premium on their dishonesty is the very low rate of wage they are paid. Many of these men are Corsicans, whose only qualification is that of an olive planter in Southern Europe, men for the most part too ignorant to study any works or treatises on coffee even if such were procurable. Having such a man in charge, owners sometimes visit their properties. I have a friend who lives, at most, two hours ride from his estate of 470 acres: he has been on it once only during the past four years, and his constant cry is "I want to sell; I don't know why, but the place is a very heavy expense and does not pay."

One seldom hears of old plantations changing hands, the land selected is generally bought from Government and is well timbered. Under old Spanish rule these lands were acquired by asking for them, getting a couple of friends to value them, and paying the surveyor's fees. Your friends, who were also the nominees of the alcalde, valued them from afar off, the farther the better, and the surveyor took 50 cents. per acre instead of a dollar, and sent some poorer brother in the profession, and thus the lands cost a couple of dollars per acre. But a dollar was often only worth 48 or 50 cents. and the measurements were only on the boundaries and a few acres *more* or *less* did not matter in the least. Of course the measurement, evading the ridges and khuds, gave the buyer an enormous percentage, and he might easily alienate 50 or 100 acres out of, say, 500 and still have his 500 left.

Having acquired the land, the first thing to do is to put in a gang of *cutlas* men (peons) to clear off the under-growth, then, irrespective of the state of the weather, the season or distance from the plantation or the size or quality of plant, a few peons are sent off to bring plants; these are simply hauled out of the ground and tied up in bundles, sometimes carried on the peon's head or in baskets on a horse. One thing only do I know to be considered in the matter, *viz.*—The moon's phases—any one who would plant when the moon is new being considered an idiot. When the plants arrive on the scene of operations each peon takes a small bundle and with the point of his *cutlas* scoops out a hole in the ground an inch or two deep, then taking special care to double up all the roots to suit the size of hole, he sticks the plant in the ground and kicks a little dirt over it, pressing it down as tight as he can with his foot. Or on better managed properties the peon goes forth to plant with a hoe or mamutie and digging a hole some 8 in. × 6 in. × 4 in. deep (or any other size it may please him) he treats the plant in the same way as his less enlightened neighbour who only has the *cutlas*.

I have not forgotten lining and distance, which is done by the rule of "pata gallo" (Anglice "cock's foot") or to be more explicit, anyhow and all over the place; it is the rule, however, to put two or more plants in one hole, and I have seen as many as six within an eight-inch circle. The reason given for this is that one is sure to die, but if it does not, the two (or more) still remain. I know one estate where the man lined off fairly well and sank small wells at six feet in the row and nine feet from the row, holes about 12 inches square, but instead of filling up the deep holes again he put the plant on the bottom of the hole, roots duly bent, and then half filled the holes. I said before that there was no theory, but I erred. This man had one: it was that the holes filled up with the wash of surface soil, &c. Having got through the planting, a few axe men are put in to fell some of the smaller injurious trees and circle a particular class of very large timber tree. These go on rotting for years, the branches falling from time to time and the tree eventually coming down with force enough to destroy all the coffee within reach.

Shade is not the vexed question here that it is in other coffee lands. Everybody plants it and takes care to have enough. There are three sorts of shade tree, but only one that can be taken into any consideration. The Immortelle or *Erythrina umbrosa*, locally known as Hucar, is occasionally found; a tree known as *mocha* also gives good shade, but takes a very long while to grow, for which reason it cannot be highly valued as a shade giver, and there remains only the Guava, not to be confounded with the fruit of that name. I regret, for many reasons, that frequent enquiries have failed to elicit the botanical name of this tree such Spanish books as mention it omit the Latin name or say it is not known. As a shade for coffee I consider the Guava one of the most, if not actually the most, suitable I know of. Bananas and plantains are also planted in great quantities but their shade is a very secondary thought: they help to pay expenses.

Weeding is not carried on in any systematic way. Sometimes it is given out in contract and on pay-day there is a regular Donnybrook, as no one is satisfied as to measure-

ments. If a man works by the day and is employed in a dozen different parts of the estate or distinct odd jobs, his name appears in as many different pay-lists, and as he has to argue over each amount it sometimes takes from early Saturday afternoon till 2 or 3 o'clock in the morning to pay out a couple of hundred dollars. My record time for 187 coolies, men and women, with 57 children in the measuring gang with a total of 283 rupees is twenty-nine minutes, but then I wanted to ride a race at a Gymkhana.

But to Porto Rico! Pruning and tapping are quite unheard of and the use of secondary branches is not known, and they are sought for in vain, whilst it is no rare sight to see a tree some 15 or 18 feet high doubled by its own weight or frequent hauling down by the pickers. Another curious custom that prevails is to bend a tree to the ground and plant the end so bent; this is done to promote the growth of suckers or shoots from the whole of the half circle thus formed. This is considered a very scientific arrangement and when any uninitiated visitor is looking round they are sure to trot this out as the very height of advanced cultivation. The wildly erratic statements to be gathered from old men and old planters in the island is really amusing, and when "Popular Errors on Coffee" or "The Coffee Planter's Fun Doctor" is published—in three volumes—a large and rapid sale may be expected.

The last—though not the best good yarn that came to notice will serve as a sample :—

Ignorant One.—"Your trees are old, are they not?"

Answer.—"Oh! Si, Señor, more than 100 years."

I. O.—"But is that not too old to get good results?"

A.—"Oh! no. Señor, the older they are the more they give; they go on increasing every year."

I. O.—"But are they not very high?"

A.—"Oh! no, the taller they are the more coffee they give."

I. O.—"Oh! Ah! Yes, I begin to understand"

Our gathering season begins about the end of October and is practically over at the end of November, but small quantities may be got in as late as the end of January. It is usual to make three gatherings, at each of which some of the ripe and a lot of the green berries are brought in. The pulpers in use are of wood and made in the island, and they give capital results. I consider them most serviceable and I prefer them to one I know that was not made in Porto Rico and cost three times the price. Very little attention is given to washing, whilst in some large properties and nearly all small ones the whole crop is dried in the pulp. There is very little machinery in the island and drying is done in large wooden trays which are mounted on wheels and thus run out of or under shelter on wooden rails at will. The shelter is most frequently the dwelling house. As the crop season is closely followed by the rains, it is difficult to dry the coffee till February or March Hulling is sometimes done in a large pestle and mortar, whilst some plantations are provided with a tajona or peeling mill on the principle of that advertised by Messrs. J. Gordon & Co., of London, but this one consists of a very large solid wheel, made from heavy wood, and the husk is winnowed off by the wind, after which it is submitted to a long and tedious hand-picking and sorting. It is the general idea that Peaberry is better than the ordinary coffee, and that light coffee or any that floats in the washing is the pick of the crop; this latter is, therefore, kept by the planters to make little presents to their friends. (*Very* little, I fear.) Due to our methods of production one old district averaged for the last season's crop, the astounding quantity of 4 cwts. (400 lbs.) per acre, and this was not considered remarkable. Our berry for the most part is somewhat small, owing to the elevation of the estates, but a good sized and fine looking berry is obtained at higher elevations.

Some people go so far as to say that small berry is the secret of the very excellent and peculiar flavour of Porto Rico coffee.

If our mode of production is somewhat peculiar, we also have our own way of cooking the coffee. A quick open fire of charcoal is made and an iron pot put over this, and when very hot sufficient coffee for a meal or the day is put in and stirred about, some moist sugar is put in and when nearly cooked some wild Syrian rue or *Peganum harmala* is added: this latter gives place to chicory. In ten or fifteen minutes the coffee is satisfactorily burnt, I should say, roasted. After this operation the cook won't wash her hands, as she would get fever; she won't go across a stream of water, as she would die; but then the women won't comb their hair at night time, as they would surely lose their memory. I do not know many who chance losing the memory, but I did know of one who crossed the stream and died; I should be sorry to assert she had been roasting coffee, though that is stated as a fact.

NOTES.

Lipton in Ceylon. It is reported that Sir Thos. Lipton has purchased Cairns Hill, adjoining Eadella Estate, Kaduannawa, (Ceylon for something like Rs.30,000. The property is fully planted in tea.

A hybrid Ape indeed. Under the heading of "Aviaries," the Director of the Botanical Gardens, Singapore, reports that one hybrid ape was born. Some tortoises are also referred to, including a "rare" one—a *rara avis*, certainly.

Quinine in Italy. The quinine-factories at Genoa and Milan are busy just now. The Government is preparing a law to take the manufacture and sale of quinine into its own hands, and the law is likely to pass.

Venezuela Coffee going to the wall. We read that owing to the low prices realised for ordinary grade coffee, Venezuela planters have found it necessary to turn their attention to other plants which give a more lucrative return.

"Proceedings." We have a heavy batch of Proceedings of District Planting Associations this week. Those of North Mysore derive a special interest from the remarks of Dr. Lehmann, the lately appointed Agricultural Chemist to the Government of Mysore. Comment must, however, be deferred until next week.

Tea Prospects. Present level of prices in London would seem to be fairly safe until July or so. If, then, a big crop of Indian is promised, it may be expected to have a more or less depressing effect upon the market. If, however, only a light crop is likely to be realized, prices are pretty certain to "boom." Indeed, some authorities consider that nothing much short of a panic may be looked for.

Coffee in Perak. In notes on a Botanical Tour in Perak, Mr. C. Curtis, Assistant Superintendent of Forests, Penang, reports:—"The Coffee looks well, although there had been an unusually long drought at the time of my visit. Given suitable soil the success of this cultivation in Perak is assured, but the present low price must be a great disappointment to those who invested heavily two or three years ago.

The London Tea Market. Messrs. Gow, Wilson and Stanton cabled from London to Colombo on 13th instant that the market generally was steady. Good liquoring Broken Pekoes easier. Fair liquoring Ceylon Pekoe Souchong was quoted 8¼*d.*, average for the week 9*d.*, a rise and a fall of ¼*d.*, respectively. Out of 30,000 packages offered 25,000 were sold. Of Indian Teas 21,000 were sold out of 22,000 offered, the average being 9¾*d.*

North Indian Tea. The *I. P. G.* hears on very good authority that the samples to hand of this season's teas so far show a great advance in quality, valuations being highly satisfactory. Tea manufacture is established on all the gardens around Darjiling, although the first flushes will be checked by the cold, which is unusual for this date, the maximum thermometer only registering 59 during Monday.

Mango Cultivation in the Natal Botanic Gardens. The annual report of the Curator of these Gardens, 1898, states that the Mango crop has been an almost total failure, for though the trees promised well in the early part of the season, the fruit was subsequently attacked by insects so severely that scarcely a sound fruit was to be got. Of the large green variety the Curator had not seen a single ripe and sound fruit in the Gardens during the season. "Gassing" is recommended as a remedy.

Jadoo Fibre. After experimenting in 1897-98 with a ton of Jadoo fibre, the Curator of the Natal Government Gardens reports that certain ferns, &c., grew well in Jadoo, but that "none of the plants or ferns showed any better results than those grown in our ordinary potting soil;" while *ficus elastica* and *magnolia fuscata* failed entirely in Jadoo, though a small percentage of the former and 50 per cent. of the latter rooted well in soil. One or two other plants also showed more satisfactory results in soil than in Jadoo.

The Teak Tree in Natal. The Annual Report of the Natal Government Gardens, 1898, says:—"*Tectona grandis*—the well known Teak tree. One tree of this species has been in the Gardens for many years, but was overshadowed by a large Australian Acacia. Since the removal of that tree, however, it has borne seed and plants have been put out, and so far promise to do well. I need scarcely say that the wood is most valuable, but it is a tree of slow growth." There is nothing to show whether Teak cultivation has been tried in Natal outside the Gardens.

The Chemistry of the Cinchona Alkaloids. The *Monatshefte* says:—According to Cordier, when cinchonine hydrobromide is heated with caustic alkali dissolved in alcohol, a mixture of bases is obtained. From this mixture there can be separated several isomers of cinchonine. Amongst them are tautocinchonine, melting at 252°, strongly dextrorotary and forming a dihydriodide, $C_{19}H\ N_2O.2HI$, which crystallises in beautiful yellow needles, melting at 238°. Another isomer, which the author terms *e*-cinchonine, melts at 152°, and is dextrorotary $[a]d = 678°$. Two other isomers were also separated.

Adulterated Tea. A Home paper remarks:—Among the latest discoveries of the public analysts is that the Customs authorities are growing careless in the matter of the tea imported into our ports. There have been two prosecutions within the past few months for an alleged excess of foreign matter in samples of tea, but both of these were dismissed, and now there is another prosecution proceeding in which a small country grocer is being made to bear the expense of a scientific discussion as to how far the Customs authorities are doing their duty in examining tea. Of course, discussion of the case now before the courts is precluded. At the same time, it is a great hardship that retail grocers should have to bear the brunt of this battle.

Coffee Pests in the Straits Settlements. Among the pests reported from coffee plantations in the Native States of the Straits Settlements are the coffee locust and the Beehawk moth. The former did damage to coffee fruit trees, ferns and other plants. Specimens sent to the Natural History Museum, London, were identified as *Cyrtacanthacris nigrovaria*, Walk.—curiously, a very rare insect in entomological collections in Europe. It lays its eggs in slits in the bark of the trees, causing the death of the branches. Destruction of the adult by children with sticks, and clearing the adjacent land of grass was recommended. As to the Beehawk moth (*Cephanodes hylas*), the larva devours the leaves, and what was apparently the pupa of a sawfly was also sent from Selangor with samples of badly injured leaves. The borer caterpillar was also at work.

The Indian Cooly in British Guiana.

The *British Realm* for March states that in British Guiana at the present time some of the largest cattle holders are time-expired coolies. They own landed property and become absorbed in the general population. In short, the great majority of them do not desire to return to their native country, and it would be a graceful act on the part of the Indian Government to consent to the abolition of the return passage money in future contracts with the immigrants. The coolies themselves do not require the assistance nor do they ask for it; and even at the present time they are called on to pay a portion of their return passage money. But what the planters want is to be relieved of any liability in the matter at all. And, seeing that the importance of labour is a necessity, and that the coolies do not care about going back, it seems only reasonable that the Indian Government should give way, and abolish this extra tax on the production of cane sugar.

The Sorting of Teas.

The *Planter* writes:—It is now some twenty years ago that a leading firm of tea brokers in London wrote that much time and labour was unprofitably employed in sorting our teas into so many classes. It was pointed out that the grocer at home mixed back different teas to suit his own trade, and with the appliances in the shape of sieves and cutting machines which he had at command was able to cater for the consumers better than the planter could. The firm wrote:—"We look forward to the time when any ordinary Pekoe Souchong or unassorted tea possessing sterling quality in the cup, with an even leaf will be more saleable than teas as assorted at present." It is strange that that time has not yet come. Many important changes have been introduced, but we still go on assorting our teas according to the old classes. Will we ever save both time, trouble, and expense by sending home our teas practically unassorted?

Colombo Tea Sales.

On the 12th instant the *Times of Ceylon* reported:—"There were a million and three hundred pounds of Tea disposed of at to-day's sale at the Chamber of Commerce, this being the first sale after Easter. There was also a good demand for all grades of tea, and the prices were about firm at the prices realised at the last sale. In some instances a slight improvement was shown in Pekoe and Pekoe Souchoungs; and there was an improvement in the figures for dust of from five to eight cents. Messrs. S. J. Tokmakoff and Co., the new Russian tea buyers, in Colombo, were large purchasers to-day for practically all grades and also dusts. At 5-30 p.m. the sale was still proceeding.' Following this up on the 13th inst. our contemporary said:—"At yesterday's public sale of tea at the Chamber of Commerce Rooms abont 14,221 pkgs. = 1,161,679 lbs. was offered, of which about 12,238 pkgs. =993,523 lbs. were sold. Owing, no doubt, to a slight falling-off in quality noticeable in most of the teas offered at the sale, prices ruled rather easier than at last auction. The finest teas among the high-grown in the sale were: Middleton, St. John's, and Glassaugh. Among low-grown teas good invoices were offered from Glenmore, Putupaula, Pallegoda, Perth, Eila, and Rayigam."

Camphor Cultivation.

The *Times of Ceylon* remarks:—Those interested in experimental planting, and who are familiar with the camphor shrubs grown at Peradeniya, would be agreeably surprised if they visited the camphor plantation at Hakgala gardens. Cuttings planted two years ago are now vigorous trees; and the Superintendent has found that the twigs and leaves are as full of camphor as the maturer parts of the trees. Mr. Nock is naturally anxious to possess a distillery—which could be obtained at no great cost—to enable him to make experiments. He could then discover which months of the year are most favourable for extracting the greatest quantity of camphor and for taking cuttings. It could also be decided whether the prunings continued to be of value, or whether the present profitable condition of the leaves is only temporary. Last year several planters were supplied with cuttings sent in small baskets; and Mr. Nock, as soon as he receives the permission of the Director, is prepared to supply applicants during next month. The cuttings have to be well shaded for the first fortnight; and the best soil, we understand, is that which is well watered without being damp. Doubtless, instructions would be issued with each assortment of cuttings.

The Foochow Tea Improvement Company.

The *Foochow Echo* says:—The news of the winding-up of the Foochow Tea Improvement Co. comes as a great disappointment to us all. Any hope that remained of a possible revival of the trade rested on the chance of our being able to meet the demand in London and other markets for machine-made teas, and now that that has to be abandoned we are left with the gloomiest of prospects. The wish being father to the thought there are those who argue that the end is not yet, that there is nothing more certain to happen than the unexpected, that we need not despair. Who knows, they ask, that India and Ceylon will be able to meet the rapidly-increasing consumption of tea all over the world? Are there not such things as drought and blight, without referring to the arbitrary Indian exchange? Will not the Chinese see soon how greatly it would be to their advantage, as an economic measure, to do away with, or at any rate lessen, the heavy duty, likin and squeezes which have been killing the trade? These thoughts will be read by most of us as the dreams of despair. Nothing remains but to make the best of what is still left us and await the course of events; but in the meantime our thanks are due to the Tea Improvement Company for the time and money they have expended in their endeavour to revive our languishing trade.

Market for Queensland Coffee.

Some dissatisfaction (says the *Brisbane Courier*) has been expressed at Cairns with respect to the market for Queensland-grown coffee, and an endeavour made to enter upon a campaign to secure an increase on the present protective tariff of 4d per lb. Inquiry shows that the position of the coffee industry does not require any such retrograde movement as that suggested. Queensland coffee is highly spoken of, both by Harper and Co and by Thurlow and Co., and there is a very fair demand for it. But there has been a drop in prices, and Queensland growers are feeling the effect of it. Mr. Thurlow says that the Queensland coffee his firm has received shows a good liquor, but the bean does not seem sufficiently matured. It has not attained the size which might be expected with proper cultivation in this country;

but the trees are young yet. When roasted and ground the bean has given excellent results as compared with South American coffees; but it does not compare with either Ceylon or Java products. Mr. Thurlow has great faith in the industry here, and when in England recently he purchased machinery for hulling and dressing the bean, and will be prepared to treat the bean for growers or to purchase right out. The trade here consider that the present market price is the best that can be given for Queensland coffee.

Java Cinchona. From a report on the Government cinchona-plantations in Java it appears that the total production of Government bark in 1898 was equal to 715 tons; the whole of this had been shipped to Holland by the end of the year, with the exception of 4,783 lbs. of succirubra bark supplied to the Netherlands Indian Medical Service, and 12,200 lbs. of Ledgeriana bark sent to the Bandoeng Quinine works. The rainfall was greater in the last quarter of 1898 than in the corresponding three months of 1897. Soon after the rainy season had set in, the graftings at the Tirtasari plantations were attacked by disease, in consequence of which about 15 tons of wet bark had to be gathered in a month's time. The disease was checked as much as possible by removing and burning the parts affected. With regard to manure-experiments, it was found that stable-manure gave the best results, increasing the sulphate-of-quinine content by ½ to ¾ per cent., whereas sulphate of ammonia led to a lowering of the contents by 0·3 to 1 per cent. The net profit for the year made by Government is estimated at about 10,400*l*. The 12,200 lbs. of bark supplied to the Bandoeng Works averaged 6·115 per cent. of sulphate of quinine, so that the works had to supply to the Government 11,958 oz. of quinine sulphate. By thus supporting a young and struggling industry, the Government did not act merely in a philanthropic spirit, for, if the bark had been shipped to Europe and the quinine had been purchased in the usual way, the cost would have been over 400*l*. more. It is, therefore, anticipated that the supply of Government bark on a larger scale to the Bandoeng Works will be arranged, to the advantage of both parties.

The American Campaign. In a memorandum, dated 22nd ulto., Mr. J. Buckingham, Chairman of the Assam Branch Indian Tea Association, says:—With reference to the proposed withdrawal of Mr. Blechynden for the States, I am of the opinion that the Assam Branch of the Indian Tea Association should strengthen the hands of the Calcutta Tea Association by taking this matter up, and protest in the strongest terms possible against discontinuing the American Market Fund at present, or taking any of its funds towards introducing tea into other countries. In Messrs. Thomas & Co's report, dated 17th February, the following is stated: "America, increase 75 per cent. Exports from 1st April 1898 to 6th February 1899.—America, 2,459,964 lbs.; Exports from 1st April 1897 to 6th February 1898, 1,397,005 lbs." While agreeing with Messrs. Thomas & Co's remarks in the all importance of every one interested in the tea industry losing no opportunity of supporting the efforts that are being made to stimulate the demand for Indian tea in every habitable portion of the globe, still I think it would be premature to take any of the funds now given towards pushing tea in America and to apply them to other countries until a plan of campaign is clearly made out. Mr. Blechynden has done (contrary to the expectations of many) exceedingly good work for us in America and to act on the supposition that his work is over or even nearly so, would, I feel convinced, be hazardous in the extreme, not only weakening our hold in America, but risking the support we now obtain. Let Mr. Blechynden's opinion be asked how far we can relax our hold in America and should he support the London Association, then let a well-thought-out plan be arranged for the introduction of tea into other countries and, if necessary, further subscriptions asked for.

GENERAL ARTICLES.

LIFE IN JAMAICA.

A Chat with a Coffee Planter.

"Yes, I have been out now a considerable time," remarked Mr. ——, in answer to my question I was out for a saunter on the hills, and had suddenly dropped into a coffee plantation, and also across the chief. Curiosity in the first place had attracted my attention to the coffee-growers' haunts; and, secondly, being very partial to a good cup of that splendid beverage, I felt a considerable interest in the plant and its production and preparation for the table. I was fortunate in finding so ready and willing an informant as Mr. ——proved to be.

On leaving the drying-shed we wound our way by a narrow stony path up a steep hill-side, plentifully sprinkled with low bushes about the size of gooseberry trees, with broad dark green leaves, and well covered with little oblong-shaped berries, in most cases bright green, whilst several were ripe cherry colour.

"Well, you see," said my guide, in answer to my query on the plentifulness of the coffee berry, "the higher one gets the cooler it is, and the cooler it is the later the crop of berries Now, we have all sorts of land here—lowland plains, and hills, and even mountainous heights, and when the bloom is on the highland plantations the fruit is being gathered in the lowlands."

I was caught napping once or twice—well, I may say, inattentive—my attention being taken by the beautiful fertile mountain slopes, varied by pretty copes, and playful little waterfalls, whilst hundreds of large stones covered with various hued mosses relieved the monotony of flat places, which constantly met one's eye during our walk.

"Yes, it's a beautiful country," remarked Mr. ——, "and most productive, too. Out here east we get mostly oranges, bananas, lemons, and such like; whilst down west yonder, on the lower ground, sugar cane is vastly produced. It doesn't pay, though, as at perhaps should. The bounties and one thing and another make the foreign sugars come at a lower rate into English markets. Out here even it is landed from German and French refineries."

We had by this time climbed to a prominent height, from where a considerable distance could be seen beyond the bright sparkling waters of the harbour below, and a good bird's-eye view was obtained of Port Royal, at the end of a long strip of sand bank, with fever-stricken Kingston at the other in the near distance, at the immediate foot of the hill. After returning I was glad to sit and make a rough sketch on two to rest.

The branches of the coffee plant have different names. The principal is named the primary, the next—a branch of the first—the secondary, and so on, and when picking the berry it has been noticed that those growing on branches nearest the main stalk are larger and of more value than the fruit of the outlying stems.

The plantation calls for the greatest attention, every tree enquiring pruning once a year at least, and the ground has to be hoed and kept clear of deteriorating weeds very often. This, in addition to the labour of picking and cleansing the berry, and afterwards sorting and packing for shipment, means an outlay of a good round sum before roasting and grinding can begin. Therefore, when the coffee is ready for the table, it has caused employment for very many hands, and has been a big expense.

In Jamaica the industry is not at present so great as formerly. Many stations have closed and are closing, on account of the cutting down of market prices. My informer graphically demons-

trated this fact by a wave of his hand. Pointing up the mountain side, he said, "Within my memory this hill has been so thickly covered as to cut out a sight of the slope; now we have only these few plants at the base."

The cleansing process of the berry proved very interesting. The berry grows in a thick skin, and the valuable part is again enclosed in a thin brown husk. The two coverings are got rid of by two processes. First, the whole bean is passed through a machine, which crushes the berry slightly, and throws it into a trough of water, where it stays for some two days. A curious thing here happens. For the most part the berries sink to the bottom after being in water a little time, and those that do not sink are put aside as not being of the same value as the heavier ones. This done, the whole heap is spread out to dry in big square yards with concrete flooring. The greatest care must now be exercised, as, should a heavy shower of rain come on whilst drying, the subsequent flavour of the coffee is interfered with; so a weather prophet is almost necessary at this juncture. After carefully drying, the water-wheel is again brought into play. This wheel works two machines. The first we have noticed; the next is a kind of a mortar, into which the beans are put, and a big wooden wheel, copper edged, slightly crushes the berries and causes the thin husk to peel off, when it is blown away by a large fan kept in motion by the same water-wheel. From this machine the beans come in a fit state to be roasted. Previously, however, they are generally classified in different sizes, such as Nos. 1, 2, 3. For this purpose a long cylindrical measure of wire-netting is used. The whole of the beans are passed down the measure, and come out at the other end through the holes which "sizes" them.

If the berry has been kept for some eighteen months after thus prepared, it adds to its flavour, and hence its value. The Jamaican climate is not suitable to the produce of the finest brands of coffee, but a good aromatic berry is cultivated.—*Leeds Mercury.*

CEYLON TEA ON THE CONTINENT OF EUROPE.

Mr. S. Philip, Secretary of the Thirty Committee of the Planters' Association of Ceylon, has forwarded to the press the following :—

Extract from a letter from Mr. M. Bremer to Mr. J. P. Ryan, Hotel Beau-Rivage, Ouchy, Lausanne, March 25th, 1899.

You asked me the other day at Milan to let you know how Rogivue was getting on. He is now in Switzerland establishing agencies for Jas. Finlay and Co., and they want him to do the same in Germany. He sells and advertises Ceylon tea chiefly, and there can be no doubt that the conversion of his business into a company, with a man like Sir John Muir as chairman, has enabled him to push our teas far more successfully than he was able to do when working on his own account. He now has capital as his command, and money is not stinted for advertising. His whole time is taken up in travelling between Moscow, Constantinople, Switzerland, and London, in all of which places M. Rogivue and Co. have established themselves. I enclose some circulars, &c., to show you what is being done. Thousands of sample packets, circulars, &c., are sent out. I had no idea that he had done so much for Ceylon until we went into details, and there is no doubt he is deserving of every support which the Thirty Committee can give him. Of course he is making a good thing for himself; but his opportunities for making our teas known are now so many that the more we can help him the more we shall help on ourselves. I have been travelling about the country with him, and have seen how he is able to push business. His teas are A.-1, and are so superior to what the people have been accustomed to get that every day brings in fresh orders from people who have tasted the tea at some friend's house. In Russia he has spent a lot of money in sending out thousands of elegant little tea-pots, marked Ceylon tea and with directions for making, also thousands of photographic cards, and this year thousands of very attractive-looking and useful tea-caddies are going out. He is quite enthusiastic over it. It is most gratifying to find such enthusiasm. Rogivue told me that the money he had received from the Tea Fund was a mere nothing compared with what he had spent in advertising. If he applies for assistance in Switzerland, I hope his application will be granted, as I am sure the money will be well spent. There are all sorts of people pushing tea here; but they are nearly if not all agents for London blending houses, and do not make such a speciality of Ceylon as Rogivue does.

CACAO DISEASE.

Certain authorities in Trinidad attach less importance than Mr Carruthers does to pod disease in Cacao. Messrs. A. P. Marryat (Chairman), J. Carmody, F.I.C., F.C.S., Government Analyst, and J. H. Hart, Superintendent of the Government Gardens, considered in Committee the subject of "Cacao Pod Disease," and laid the following report before the Agricultural Society, Trinidad, on the 14th ultimo.

At the meeting of the 14th February after discussion on the so-called "Cacao pod disease," the Committee appointed a Sub-Committee to make a Report, dealing with the various facts brought out in the discussion, and to invite further information from members of the Society.

The opinon of the Sub-Committee is as follows :—1. That the malady is due to a fungus, the precise species of which is being investigated at Kew, but that pending a longer term of observation and of a series of experiments, it would be premature to make too positive assertions, as to its origin and growth. 2. Experienced planters state that they have in certain seasons, known the pods to be similarly affected any time during the past 25 years. Much depends on the nature of the soil. November and December are the worst months, especially if cold, wet, and a northerly wind follow a hot Indian summer. With the dry weather the fungus disappears. 3. There is no evidence to show that the Cacao tree itself is in any way affected by the malady of the pods and to all appearance a perfectly healthy tree may be laden with diseased pods. The fungus has not been observed to penetrate or damage the bark, even when a diseased pod is lying against the trunk. 4. The experiments which the Government Botanist has found time to make, unfortunately only on a limited scale, prove conclusively :—*a.* That a sound pod inoculated from a diseased pod, readily takes the malady and becomes rotten in a week to ten days. *b.* That pods in the immediate neighbourhood of the inoculated pods, though purposely wounded with a knife, were not affected. It has yet to be proved that the malady is infectious.

5. It having been shown that a wounded pod readily accepts inoculation, it is obvious that the fungus may be carried and spread by rats, bats, squirrels, wood-peckers, insects, etc., which attack the pod.

6. Assuming this to be possible, the origin and the home of the malady may not be far to seek. The Government Botanist in visiting an estate by request, noticed within a narrow radius of the "breaking" grounds, a greater number of black pods, than in other parts of the cultivation.

7. In some Cacao countries (Surinam and Central America), the practice of breaking the pods in the field itself, and of allowing the shells and refuse to remain and rot on the ground as in Trinidad, is unheard of. The pods are picked and carted to the "works," then broken, and the refuse placed on the manure heap and properly treated. To ask the planter in the hilly districts to adopt this system, would be too great a tax on the labour and stock at his disposal, but pending further investigation, and as a matter of precaution, it is recommended that the following procedure be adopted:—(1) Where burning is not practicable, to cover all refuse with soil and bury it, or otherwise *completely* destroy it. (2) Or the "broken" pods may be chopped up small and covered with quick or temper lime. This in time would form a safe and valuable manure. (3.) All pods showing signs of attack should be carefully collected and destroyed. The probable home and nursing ground of the fungus would thus be destroyed.

8. In conclusion, the Sub-Committee is inclined to think that an undue importance has been attached in certain quarters to the question of disease amongst Cacao, which would never have arisen but for the publication of Mr. Carruthers' Report on Ceylon Cacao disease.

Complaints of the same character have arisen in Trinidad from time to time for many years past, but so far as can be ascertained no serious loss has occurred; but the question having been raised, the committee is of opinion that it should not be allowed to drop until thoroughly investigated.

It is highly probable that conditions of season have a great influence on diseases of the nature above discussed, and that given more favourable conditions, no more will be heard next year of "Cacao disease"; but bearing in mind that prevention is better than cure, the Cacao planter will do well to put himself in the position of the prudent householder, who when rumours of fever are in the air, looks to his sanitary arrangements and sees that his surroundings are kept sweet and clean.

P.S.—It will materially assist the committee if members whose crops during the past three months have suffered from "black pods," will put in writing their experience, coupled with suggestious and forward them to the Secretary Mr. E. Tripp.

PRODUCE AND PLANTING.

Tea and Coffee in America.—Although the people of the United States are not large consumers of tea, the representatives of the Indian and Ceylon tea-planters have yet considerable scope for activity, for China last year supplied 44·4 per cent. of the total imports of tea into the United States. Perhaps when the art of judicious blending with China is thoroughly understood, and the advantages from the point of view of purity which Indian and Ceylon tea possess, as compared with China, make a deeper impress upon public opinion, business will develop more rapidly. The Americans are, on the whole, coffee-drinkers, and the consumption of coffee was never larger than at present, although less than 4·4 per cent comes from India and Ceylon. The United States Government's official record of imports for the calendar year 1898 show gross imports of 804,250,988 lb.; exports, 23,231, 141 lb.; leaving net imports of 781,019,847lb., against 787,561,585 lb. in 1897, 621,429,664 lb. in 1896. This shows an average annual net import for three years, which practically represents consumption of 730,003,632lb., or over ten pounds per capita. Of the total imports of coffee 75.6 per cent. came from Brazil, 20 per cent. from the West Indies and other South American countries (except Brazil).

The "Magnificent Tea Industry."—This pamphlet, while attacking the policy of the Indian Government, pats the Indian tea-planter on the back. It says: "It would be far better for the Indian Government to spend part of its present surplus in teaching its subjects how to grow an improved stock of sugarcane and how to extract and manufacture the sugar by scientific methods. It is by means of scientific cultivation and scientific manufacture that the magnificent tea industry of India has been built up, and by the same means India could quickly create a sugar industry that no other country could rival. Instead of helping in the development of such an industry Lord George Hamilton proposes to throw India back upon methods of sugar production that were already ancient when the Honourable East India Company first received its charter from Queen Elizabeth."—*The Home and Colonial Mail.*

PLANTING JOURNALISM.

Apropos of the announcement of the result of our "*plébiscite*," the *Planter* recounts some of its own experiences in the matter of endeavours to meet the taste of its readers. Our contemporary's file of letters appears to bear a striking resemblance to our own. We could match some of the epistles almost word for word. The *Planter* discourses thus:

Planting Journalism is surrounded by difficulties; it is impossible to please everyone. In our issue of 31st December last, when we made somewhat of a new departure and introduced one or two innovations, we wrote in the opening "Echo" that we were aware of this difficulty, and were mindful of the tale of the old man and his ass. Looking back on former experience on this and other planting journals, it is amusing to note what widely different grounds the inevitable letters of complaint take. "Your paper is not so interesting as it used to be," wrote one correspondent; while another, whom we knew to be a well wisher of the journal, gave expression to his thoughts by penning us the following lines:—"I venture to say that, after a hard day's work, a planter likes better to see the opinions and letters, etc., of his fellow-planters, and an occasional bit of poetry (which can be thoroughly appreciated by a planter), than a whole lot of statistics and matters of record, which his eye skims over as a rule." Then he adds, "I think planters ought to assist you, and write articles and letters, etc., as far as possible, otherwise they have themselves to blame for not assisting you and thus getting a most interesting and instructive paper." We say "Amen" to this most sincerely. A "deficiency" pointed out by a third correspondent was that the journal "was too heavy. More light reading, to wile the weary hours away, is desirable: planters cannot always swallow nothing but tea." Recently, one of our oldest contributors deserted us, because "the *Planter* was getting too beastly scientific." Another adviser writes:—"Yours is a Tea paper, and there should be nothing but Tea in it. If we want light reading we can get it elsewhere."

An old contributor, formerly on the staff of the first tea journal, writes: I remember well a visit from another class of objector,—he was a shareholder. He remarked that he subscribed to the ——— for its lists of tea sales, its share market reports, and for its comments and reports upon the publications of public tea companies; and he protested with much warmth that we had not been "pitching into people" so much lately as of yore. I endeavoured to explain to our irascible friend that many grievances had been remedied, that the detailed management of tea companies had very considerably improved, that yearly reports and accounts were presented now, generally speaking, in a fuller and more explanatory manner than they were years ago,—although there was still room for improvement in this respect; and that economy had been carried out in Agency offices (on behalf of the companies they represented) as well as on factories. Our most troublesome critic was, however, a stolid old gentleman, who called at the office one day, and after an "all-embracing" harangue, wound up by saying:—"You don't give sufficient *statistical* information. Yours is not only a journal of current information on tea topics, but as I understand it, is a journal of *record;* so that a man shall be able to turn over the pages of your back volumes, and find particulars, which would otherwise be scattered here and there and everywhere, even if obtainable at all. Yours is not a newspaper; we have got more than enough of them and to spare. What we want is an accessible *record* of everything concerning the tea industry *especially* in the way of *statistics*."

Many cases might be given, most of them expressing the most directly contrary opinions, but from the few cited it will be seen that the position of any "class" journal is subject to much difficulty. In our opinion a journal devoted specially to planting has hitherto, and will always, find itself in the position which the well-

known fable of "The old man and his ass" has made so familiar to all of us. No journal can possibly please everybody. There will always be croakers of all sorts, but the paper that recognises it has a large field for usefulness before it, and does its best, according to the light afforded it, and the experience of its editor, should eventually be able to hold its own, and gain the appreciation of the majority. Planters have it in their power to aid their brethren very much by supporting a planting paper and by an interchange of experiences, but many seem strangely indifferent to the general advantage which would follow from this. Why this is so it is difficult to understand, but such is the fact. When the first tea journal was started. it was remarkably the eager rush there was on the part of planters to ventilate their views in its columns. There were always several pages of correspondence. This may have been owing to the men never having until then enjoyed the luxury of an organ of their own. The novelty of the thing appears to have long since worn off, that is, as far as Indian planters are concerned. Our Ceylon *confrères*, however, put us to shame They appear to have lost no interest in their special organs, which are always full of correspondence on all sorts of planting subjects, and always respond to any appeal for information. In scientific subjects we find that men possessing special knowledge are only too willng to impart it, as far as they can, to their less-informed brethren. We trust there may gradually be a revival of the old interest that was at one time so *practically* apparent, and that planting journals will have no reason to complain of their being required "to make bricks without straw" owing to the paucity of active contributors.

TEA, &c., COMPANIES.

Tyroon Tea Co., Ld.—Crop 1,918 maunds, average sale price 6 as. 11 p. gross, against 7 as. 11 p. the previous year. Profit Rs.4,834-13-2. Proposed dividend 4%. Estimated crop for 1899 about 2,000 maunds, with Rs.35 per maund.

Chundeecherra Tea Co., Ld (Sylhet).—Outturn 2,998 maunds, average price 5 as. 7 p. as compared with 5 as. 11 p. in 1897. Profits Rs.3,783-0-10. Estimate for 1899, about 3,500 maunds.

Eastern Cachar Tea Co.—Outturn 5,238 maunds, average price 5 as. 7 p. Loss Rs.4,675-11-9. Estimate for 1899 about 6,000 maunds.

Gielle Tea Co., Ld.—Outturn 1,579 maunds, average price 7 as. 6 p. Estimate for 1899 is 1,600 maunds.

Dessai & Parbuthia Tea Co., Ld.—Outturn 262,880 lb. An amalgamation has been effected between the gardens of this company and the Koleapani Tea Estate, as from the 1st January 1899.

Naga Dhoolia Tea Co.—Outturn 134,412 lb., average price 7 as. 1·22 p. Loss Rs.33,397-6-8. Estimate for 1899 is 180,000 lb.

Iringmara Tea Co.—Outturn 205,641 lb. Loss Rs.18,339-9-11. Estimate for 1899 is 240,000 lb.

Nahorjan Tea Co., Ld.—Outturn 131,210 lb., average price 6 as. 9·55 pies. Loss Rs.3,741-13-3. Estimate for 1899 is 148,000 lb.

Balijan Tea Co., Ld.—Outturn 329,032 lb., average price 10$\frac{11}{32}$d. Proposed dividend 7%, making 10% for the year. Estimate for 1899 is 306,000 lb.

Samanbagh Tea Co.—Crop 6,506 maunds, average price as. 5·3$\frac{1}{2}$ Profit Rs.14,905-10-7. Estimate for 1899 is 6,400 maunds.

Cutlacherra Co., Ld.—Outturn 1,745 maunds. Loss. Rs.10,031-11-4. Estimate for 1899 is 1,800 maunds, probably showing a loss of Rs.19,318-7-0.

The Eastern Produce & Estates Co, Ld.—The Eastern Produce & Estates Co. Ld., have declared a dividend of 4$\frac{1}{2}$ per cent. per annum.

The Balijan Tea Company, Limited.—The following is from the report of the directors that was to be persented to the shareholders at the sixteenth ordinary general meeting on 6th inst:—The manager's estimate was for a crop of 304,000 lb. The actual production was 329,032 lb., whilst the garden expenditure was below the estimate. The whole of the crop was sold in London, the average price realised being 10 11-32d. per lb. The accounts for the year, after charging the whole of the new machinery account brought forward from last year, viz., £758 11s. 7d., and the proportion chargeable on permanent building account, show a profit of £5,164 16s. With the sum of £4,242 6s. 5d. brought forward from last year (and after deduction of *ad interim* (dividend) there is a total of £6,462 2s. 5d. to the credit of the profit and loss account, out of which the directors recommend the payment of a final dividend of 7 per cent., free of income-tax, which, with the *ad interim* dividend of 3 per cent. paid on December 14 last, will make a total dividend of 10 per cent. for the year 1898, and leave £4,257 2s. 5d. to be carried forward. The manager's estimate for 1899 is 306,000 lb. of tea at a cost of Rs.1,02,954, which is equal to about 5 annas 4 pies per lb. at the garden. This includes the sum of Rs.11,250, which is the estimated outlay on permanent building account. Mr. C. T. K. Roberts retires by rotation from the office of director, and being eligible offers himself for re-election.

Meenglas Tea Company, Limited—The following is from the report of the managing agents:—The audited accounts for 1898 show a profit on the year's operations of £5,096 18s. 10d., carried to the credit of profit and loss account. Out of this sum an *interim* dividend of 3 per cent. has already been paid, and a further £600 added to reserve. It is now proposed to pay a final dividend of 5 per cent., leaving a balance of £1,218 2s. to be carried forward. The comparison of results for the past four years shows satisfactory progress, and is as follows: 1895, £2,875 16s. 3d.; 1896, £3,016 8s. 5d.; 1897, £3,644 7s. 7d.; 1898, £5,096 18s. 10d. Crop for 1898 was estimated at 600,000 lb., and the garden made 604,028 lb. This compares with 586,950 lb. in 1897, and 579,936 lb. in 1896. The average price obtained was 7.59d., as against 7.5d. in 1897, and 7.19d. in 1896. The area under plant at end of 1897 turned out on survey to be 888 acres, to which about 60 acres were added during 1898, thus making the total 948 acres Cost of this extension has been paid out of revenue as will be observed on reference to the accounts.

DISTRICT ASSOCIATIONS.

COORG.

Proceedings of a General Meeting of the Coorg Planters' Association, held at the Bamboo Club, Pollibetta, on Monday, 13th March 1899. Present:—Messrs. E. M. Breithaupt, W. Davies, G. L. Duncan, J. W. Finlayson, G. C. Garrett, H. G. Grant, R. Hamilton, Jas. Hume, O. Jones, A. Lambert, John Logan, H. M. Mann, H. Marriott, H. Robinson, W. H. Sprott, A. J. Wright, W. R. Wright and H. G. Parsons, Honorary Secretary, and

By proxy.—Messrs. W. M. Ball, H. F. Davy, C. G. Maclean, C. E. Murray-Aynsley, A. W. Ogilvie, J. S. Trelawny, and A. H. Wood.

Mr W. H. Sprott in the Chair.

Travellers' Bungalow at Pollibetta.—Read correspondence between Commissioner of Coorg, Executive Engineer and Honorary Secretary. Recorded. The Meeting not accepting the reasons given as sufficient, it was resolved, however, to take no further steps in the matter.

Pollibetta Hospital.—Read correspondence between Commissioner of Coorg and Honorary Secretary. Recorded, with regret that the Government were unable to do more in the matter.

Read extract forwarded by Commissioner of Coorg, dated 4th February 1898 (? 1899) from report of Civil Surgeon on Veerajapett Civil Hospital. Read Honorary Secretary's reply, dated 6th February, which was approved. The Association were unable to accept the statement without figures in support, and the Chairman remarked that he had urged Government, when making returns, to differentiate between coolies and estate coolies.

Plague Measures.—Copy of rules had been received by all. Chairman as member of Sanitary Board would watch interests of planting community. Action of the S. Coorg Medical Fund and correspondence with Government read and cordially approved by Association

U. P. A. S. I. Circulars.—Read letter from Chairman, U. P. A., dated 2nd February 1899 *re* resolution of Government of India on report of Committee of Inquiry, which was approved. This Association are, however, of opinion that, until the draft Act by the Government of Madras has been submitted, it is unnecessary to further discuss the terms of the resolution.

Land Record Cess.—The Honorary Secretary had received no reply to his letter, dated 6th January 1899, but had been credibly informed that it was the intention of Government to charge the salaries of certain Revenue officials to the department and in this way to work off all surplus.

Hatti-Madapoor Bridges.—A commencement was to be made on this important work and Rs. 5,000 had been allotted for the purpose. —*Recorded.*

Subscriptions.—The Honorary Secretary pointed out that the Association year ended on 31st May and that there were some Rs. 650 due for subscription which, according to the rules, should be paid in advance.

New Members. Proposed by Honorary Secretary, seconded by Chairman, that Messrs. H. Steel and W. R. Wright be elected members of the Association.—Carried *nem. con.*

Resignation of Honorary Secretary.—Mr. Parsons informed the Meeting that, as he hoped to leave for England in April, this would probably be the last Meeting he could attend. As the year ended on 31st May, the Chairman had kindly consented to carry on the work of the Association until an Honorary Secretary could be appointed at the Annual General Meeting.

In bidding farewell he would here take the opportunity of thanking all those who had evinced interest in the Association, and for the hearty support accorded to him for the past five years—five years of interesting work,—but at times somewhat exacting—and greatly increased owing to the foundation of the U. P. A. S. I. It was satisfactory, however, to hand over the Association with a membership roll that had risen from 63 to 80, and it was an honour to have represented a body commanding such respect as is due to its organisation.

In conclusion, although retiring from active work, his interest would not relax, and anything he could do for the Coorg Planters' Association would be willingly done.

There was one subject the U. P. A. S. I. might well take up, and that was an arrangement with some shipping company for cheaper passages to coffee-planters on the same lines as conceded to tea-planters,—this is eminently a U. P. A. question.

The CHAIRMAN, in appropriately returning thanks to the Honorary Secretary for his work for the past five years—work that he knew was not light,—asked the Meeting to agree to his acting temporarily, which was cordially approved. Mr. Logan seconded the vote of thanks to the Honorary Secretary, with whom he had had the pleasure to work for two years.

The following papers were laid on the table, and with a vote of thanks to the chair the Meeting ended.

H. G. PARSONS,
Honorary Secretary.

PAPERS LAID ON THE TABLE.

1. Report on Public Instruction in Coorg for the year 1897-98.
2. Précis of answers to the U. P. A. S. I. circular *re* ladybirds.
3. Proceedings of a Committee Meeting of the Shevaroy Planters' Association held on Monday, the 5th December 1898.
4. Wynaad Planters' Association. Proceedings of a General Meeting held at Meppadi on 14th December 1898.
5. Wynaad Planters' Association. Proceedings of the Annual General Meeting held at Meppadi on 4th January 1899.
6. Shevaroy Planters' Association. Proceedings of a Committee Meeting of the Shevaroy Planters' Association held on Monday, the 9th January 1899.
7. Shevaroy Planters' Association. Proceedings of a Quarterly General Meeting of the Shevaroy Planters' Association held on Monday, the 9th January 1899.
8. Central Travancore Planters' Association. The Annual General Meeting of this Association was held on Saturday, the 21st January.
9. Nilgiri Planters' Association. Proceedings of a General Meeting held at Ootacamund on January 27th, 1899.

CENTRAL TRAVANCORE.

The Quarterly General Meeting of this Association was held on Saturday, the 8th April, at 9-30 A.M. at the Garrady Goody Bungalow. PRESENT:—Messrs. R. H. Goldie (*Chairman*); F. Bissett; W. H. G. Leahy; B. Laurie; H. S. Holder; L. G. Knight; D. MacArthur; Hon'ble V. B. Wilbraham, and A. E. Veale (*Honorary Secretary*).

The minutes of the last Meeting having been taken as read, the Chairman called on the Honorary Secretary to read the Report for the year ending 31st December 1898, which was as follows:—

MR. CHAIRMAN AND GENTLEMEN.—Owing to the unfortunate illness and consequent absence of Mr. Baker, our late Secretary, from the Annual Meeting of this Association, no Annual Report was presented to the Meeting. I have therefore drawn up a short report of the past year's proceedings to act as a substitute and which, I trust, will meet with your approval.

Finances.—Our expenditure for the year amounted to Rs.*2,880-1-4* inclusive of our donation of Rs.*1,000* to the American Market Fund, as well as Rs.*200* for the expenses of our delegate to Trivandrum, an item which does not often occur. The year closed with a credit balance of Rs.*77-9-0.*

Medical Fund.—Owing to the depression from which our Industry is suffering, we found ourselves unable to maintain so costly a Fund; the Fund was accordingly wound up, the Travancore Tea Estates Company taking over the Dispensaries and who make a charge for medicines, &c., to outsiders making use of the Dispensaries.

H. H. Government was approached on the subject of appointing a fully-qualified medical man to the District and acceded to our request by appointing Dr. Joseph, to whom we guarantee a sum of not less than Rs.100 per month, in addition to his grade pay as remuneration for the extra work entailed on him in visiting members of this Association.

Telegraph.—The Director-General of the Telegraph Department informed the Association that the extension of the line from Peermaad to Kumili was too costly to be undertaken.

In reply to our enquiry as to whether Telegraph stamps could be affixed to all telegram receipts, the Director-General stated that such a procedure was opposed to all Post Office rules; it was, however, optional for the sender of a telegram at a combined Post and Telegraph Office to send telegraph stamps in payment, and if sent to the full amount, the upper halves of the stamps would be affixed to the receipt.

Our share of the telegraph subsidy for the year ending March 31st, 1898, amounted to Rs *157-2-7*, a slight decrease on the previous year, and there is every reason to suppose that it will be still less this year.

Plague.—This terrible epidemic has, I regret to say, spread further south, and has, for months past, been spreading over towns in the Madras Presidency. With a view to prevent its outbreak in this state, H. H. Government have drawn up certain rules and regulations to which every one should pay strict attention.

Currency.—This most difficult of questions has been frequently before us. Mr. Acworth ably represented South Indian Planters before the Currency Commission.

The Report of the Commission is, I believe, to be published early in June and is anxiously awaited by all Indian producers.

American Market Fund.—We again subscribed largely to this Fund and have done so every year since it was started. From statistics furnished me by the Secretary of the Indian Tea Association, I find we are the only Tea Association in South India that has regularly subscribed.

That other Tea Associations should fail to support the Fund is much to be regretted.

That this Tea campaign so ably conducted by Messrs. Blchynden and Mackenzie is deserving of support from every Tea Planter is, I think, amply evidenced by the fact that the consumption of Indian and Ceylon Tea in America has increased from 3,000,000 lbs. in 1892 to over 13,000,000 lbs. in 1898.

Cattle Trespass.—Much annoyance and damage to the property of certain members of this Association by cattle trespass caused us to apply to H. H. Government for the erection of a cattle pound in the vicinity of the estate thus troubled. H. H. Government have accorded their sanction, and a site for the pound has been fixed on near the Kuttakarnum Chutram.

Roads and Bridges.—This is a subject which engages no small amount of our attention every year. I think we must all agree, however, that the roads have of late improved; but much still remains to be done. At the same time I fail to understand why large quantities of metal have been broken, if it is not to be spread. For months past it has been almost impossible—I may even say dangerous—for a horse to pass a cart, or for two carts to pass one another on certain roads, more especially on the Carrady Goody Hill—a road none too wide in itself to admit of any portion of its width being blocked by heaps of broken metal.

With regard to the bridges in the district, I do not think that I have ever seen them in a more dilapidated and unsafe condition than they are at present, and I trust the Chief Engineer will lose no time in putting them in thorough order before the approach of the monsoon.

Railways.—A light tramway line is shortly to be constructed from Ammayanayakanur to Uttamapolium and will eventually be extended to Kuravanooth. If rates for goods over this line are sufficiently low and when taken into consideration with the cheaper steamer freights always to be obtained at Tuticorin, no doubt some estates, more especially those on the eastern side of the district, will send their tea to Tuticorin for shipment rather than as at present to Cochin.

The promoters of the line expect considerable progress will have been made in its construction by the end of the current year.

Obituary.—We have to deplore the death of one of the oldest members of this Association—Mr. J. Burrows—who passed away early in the year. Deceased was on the point of leaving for England when death overtook him.

A. E. Veale,
Honorary Secretary.

Proposed by Mr. Laurie and seconded by Mr. Holder, that the Report be adopted. Carried *nem. con.*

Correspondence.—Read Honorary Secretary's letter, No. 3, dated 27th January 1899, to the Dewan of Travancore *in re* outlet roads to certain estates.

The Honorary Secretary informed the Meeting that although he had sent two reminders to the Dewan, he had not as yet been favored with a reply.

Read Honorary Secretary's letter, No. 1, dated 27th January 1899, to the Dewan *in re* Cottyam landing stage and Dewan's reply intimating that the matter had been referred to Chief Engineer for report. Recorded.

Read Honorary Secretary's letter, No. 2, dated 27th January 1899, to the Chief Engineer *in re* bridges.

The Chief Engineer, in reply, informed the Honorary Secretary that he had issued strict injunctions for the Pambanaar and Elephant bridges to be completed before the monsoon. Recorded,

Read letter No. 38/99 from Secretay, U. P. A. S. I., *in re* the proposed labour ordinance to be drafted by the Madras Government in accordance with the resolution of the Government of India regarding the report of the South India Planters' Enquiry Committee. Recorded.

Read and approved Honorary Secretary's letter, No. 25, dated 15th February 1899, in reply.

Read and recorded Honorary Secretary's letters Nos. 21 and 75, dated 12th February 1899, and 17th March 1899, to the Chief Secretary, Madras Government, *in re* Pulliar Suttu Bridge on the Kumili Ghât, to which no replies had been received.

Mortality on Roads.—Read letter from Cardamom Hill Magistrate giving cover to one from 1st-Class Magistrate of Peermaad suggesting certain rules to be framed by H. H. Government for prevention of mortality on roads.

The Honorary Secretary was instructed to inform the Cardamom Hill Magistrate that the suggested rules met with the approval of this Association, but that they objected to Peermaad being called feverish, as the District, taken as a whole, certainly was not so. Proposed by Mr. Leahy and seconded by Mr. Bissett,—"That "H. H. Government be asked to erect shelters on the main road from "every 10 to 15 miles for the use of coolies travelling to and from "the District." Carried *nem. con.*

Medical.—Read letter from Mr. H. D. Deane on subject of Association's guarantee to Government Medical Officer, and Honorary Secretary's letter in reply. The action taken by the Honorary Secretary was approved and it was resolved that the matter be left in his hands.

Kotwal-Glen Mary Tea Case.—The Honorary Secretary informed the members that he had sent the Britsh Resident copies of all complaints, and was now awaiting his reply.

Game Laws.—Mr Holder drew the attention of the Meeting to the way in which big game of both sexes was being exterminated and the numbers of persons now to be seen prowling around the confines of estates with guns intent on butchery.

Only recently a cooly had been shot by some person unknown who had been trespassing on the Woodlands Estate. In fact, it was becoming positively dangerous on some estates to walk along the roads even in broad day-light.

He therefore proposed. and Mr. Laurie seconded, the following resolutions, which were carried unaminously:—

(1) "That members of this Association do view with alarm the "manner in which game is being exterminated in the district and "do agree to do their utmost to prevent the possession of guns by "coolies and canganis on their respective estates and in every way "to try and protect the game surrounding them."

(2) "That the Dewan be requested to confer the powers as laid "down in Section 4 of the Travancore Game Preservation Regula- "tion on all members of the Committee of this Association."

It was further resolved: "That members' attention be drawn to "Section 3 of the Travancore Game Preservation Regulation."

The Pambanaar Arrack Shop.—Mr. Leahy in moving, "That the "1st-Class Magistrate be requested to have the arrack shop at the "Pambanaar removed to the Arooday, which this Association "considers to be the most suitable position for it and where it will "be under the surveillance of the Police," said this arrack shop was a source of constant danger and annoyance. Unlimited credit was given to coolies and canganis and he knew of one instance in which a cangany had been allowed to run up a bill of Rs.80. Drunken brawls were of frequent occurrence and in which Government subordinate officials were partakers.

People leaving the shop at night in a drink-sodden condition were in the habit of carrying naked lights, and having to pass, as they frequently did, many valuable buildings, it was a matter for surprise that some of them had not been burnt. Mr. Laurie, in seconding the proposition, endorsed the remarks made by Mr. Leahy, and stated that he too was a sufferer from the shop being within easy reach of his estate.

The proposition was carried *nem. con.*

Local Magistrate.—Proposed by Mr. Bissett and seconded by Mr. Veale:—"That the Honorary Secretary do write to the Cardamom Hill Magistrate with reference to the manner in which Europeans are treated by the 1st-Class Magistrate when attending his Court." Carried *nem. con.*

Artisans' rates of Pay.—Mr. Veale, in bringing forward this subject, said that they would all remember that at the last Meeting the Chairman had expressed a wish that rates of labour should be discussed during the present year. Up to now this Association had given but little attention to this subject, although it was one well within the province of an Association such as theirs. He thought it was a good thing to fix rates of labour for the guidance of members. By fixing a rate he did not wish to make it absolutely binding, but that members who found themselves from various circumstances obliged to break the rate, let them at once inform the Honorary Secretary or Chairman.

With regard to artisans' rates of pay, they had two classes of carpenters and masons in the district, *viz.*, (1) Cochin (principally Eurasians) and (2) Natives. Now the former invariably demanded Re.1 per diem and they certainly, in his opinion, were not worth it. They were certainly more lazy and sometimes inferior workmen; whereas the latter received anything from As. 8 to Re.1 per diem, according to their capabilities.

Sawyers, too, demanded higher rates of pay in the Periyar and on the eastern side of the district. The higher rate had come in when the Periyar Irrigation Works were in course of construction.

The time had come when every Planter should combine to reduce rates to the lowest possible: he therefore proposed—

(1) "That the rates for *all* carpenters and masons be fixed at the "rate of Re.1 per diem for the maistry and at As. 12 or less for the "remainder of the gang, according to their capabilities."

(2) "That the rate for sawyers be fixed at chs. 4 (chuckrams "four) per Thowaday or at Rs.4 per 100 superficial feet."

(3) "That members breaking the rate for any reason whatever "shall immediately inform the Chairman of the fact."

Mr. Goldie having seconded the propositions, they were carried *nem. con.*

Election of Committee Members.—Messrs. W. H. G. Leahy and H. D. Deane were by ballot elected to fill the vacancies on the Committee.

Removal of Sircar Buildings.—Read and approved letter from the Cardamom Hill Magistrate. Proposed by Mr. Holder and seconded by Mr. Wilbraham: "That Bleak Head be the local Magistrates' "bungalow and that the Sircar buildings at the 45th mile be "converted into a Travellers' bungalow." Carried *nem. con.*

Post Office Receipts.—Proposed by Mr. Bissett and seconded by Mr. Laurie: "That the Postmaster-General be requested to "have the names of senders of all V. P. parcels, registered articles "and unregistered parcels placed on the receipts." Carried *nem. con.*

The Chairman (Mr. R. H. Goldie) before closing the Meeting expressed his pleasure at the interest taken in the Association by every one and that although there were not as many members present as usual, he thought they had had a most successful meeting.

With a vote of thanks to the Chairman and Honorary Secretary the Meeting terminated.

The following papers were laid on the table:—

Proceedings of the Wynaad Planters' Association (3).
Do. Nilgiri do. do.
Do. Shevaroy do. do.

Indian Tea Association.—Sundry advertisements from Mr. Blechynden's statistics shewing amount subscribed by S. Indian Association to the American Market Fund.

1898. Original crop estimates and actual outturn, No. 67-0.

1898. Exports of Tea from Calcutta, No. 70.

Indo-Ceylon Section of the Paris Exhibition of 1900.

American and Foreign Committee's Interim Report for 1899.

U. P. A. S. I. Sundry circulars *in re* the proposed labour ordinance.

Travancore Government Gazette, Vol. 37, Nos. 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13.

Planting Opinion, Vol. 4, Nos. 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13.

PEERMAAD, *April* 13th, 1899.

A. E. VEALE,
Honorary Secretary,
Central Travancore Planters' Association.

NORTH MYSORE.

Proceedings of the Annual General Meeting of the Planters' Association, held at the Club, Balehonur, 22nd March, 1899.—PRESENT: Messrs. H. Edgington, O. Scot. Skirving, P. Reed, J. Harvey, L. Kingchurch, W. Maynard, H Pilkington, H. Campbell, F. Clifford, F. J. Parton, *Honorary Secretary.* VISITORS: Dr. Adolf Lehmann (*Agriculturist Chemist to the Mysore Government*) Dr. Pereira.

Mr. F Clifford, in the absence of the President, Mr. E. C. Bolton, took the Chair.

The accounts of the year having been audited by Messrs. E. Leslie and H. Edgington were passed.

The Honorary Secretary then read the Annual Report as follows:-

GENTLEMEN.—On behalf of your Committee I have much pleasure in laying before you the Annual report for the year now ending.

Accounts.—The Accounts of the Association are in a satisfactory condition The income derived from subscriptions amounted to Rs.1,593-11-0. The expenditure to Rs.1.483-8-6, and there is now a total credit balance of Rs 2.013, of which Rs.1,000 is allotted to the Reserve fund.

I regret to say that there are still 8 estates which have not yet paid their subscriptions for '9[illegible]-'99, but hope to receive them ere long.

Crops this year have been good, but any satisfaction we may feel on this account, is fully counterbalanced by the poor prices our coffee is now realizing.

The Plague has been very severe in several districts of the Province, but I am glad to say that during the year there have only been some four or five imported cases in this district but although we have not directly felt its baneful influence, we have done so indirectly, for it has interfered with the completion of various public works more especially those in connection with our communications. These, I regret to say, do not seem to have made any progress or improvement since this time last year. The Tadsa bridge, I understand, will not be ready for traffic until 1901, and the railway to Terrekerri and Shimoga, it is rumoured, will not be opened until October. As regards our roads, your Committee intended to represent at the Durbar the bad condition of the Terrekerri-Mangalore road between milestones 12 and 22 of the Balehonur-Aldur road, also of the inconvenience caused to our members residing on the Santaverri side by the non-completion of the Baboodan hill road. On the latter subject Mr. Oliver interviewed the Dewan, by whom he was requested to put the matter into writing. This I did on December 15th but up till now no reply has been received.

Chemical Manures.—You will have read in the annual book of Proceedings of the United Planters' Association that the Imperial Government had removed the import duties on certain chemical manures, *viz.*, Muriate of Potash, Sulphate of Ammonia, and Kainit Salts. The Imperial Government also has sanctioned the appointment of Dr Adolf Lehmann as Agricultural Chemist to the Mysore Government for a period of five years, and I am glad to say that he is now present amongst us, and I feel sure that we shall all benefit by his advice. The Currency Commission are now drawing up their report, but it seems, however, to be a foregone conclusion, that exchange will not be allowed to drop again below 1s. 4d and if the Imperial Government succeed in obtaining a large gold reserve, as they now seem bent on doing, it will, in all probability, continue to rise.

The Planters' Enquiry Commission.—The Government of India has at last instructed the Madras Government to draw up a Draft Bill based on Act V. of 1856 to alleviate the loss suffered by Planters in the Native States of Southern India.

Our planting Member of Council, the Honorable Mr. H. P. Hodgson, thinks that the matter will be discussed when the local Government go up to Ootacamund in April. We hope that Government will submit their proposals before they become law to the United Planters' Association, for the matter is of supreme importance and Act V., as it now stands, is in no way suited to our requirements.

Coffee-stealing.—No cases of coffee-stealing this year have been brought to the notice of the Association, in spite of the fact, that placards offering a reward of Rs.100 for information leading to the conviction of receivers of stolen coffee, were posted in the principal villages of the district. The absence of claims for the reward does not, I fear, mean that coffee-stealing has in any way abated.

The Maharajah passed through Koppa on his way to Shringerri, in December, and your Committee presented him with a short address of welcome which he was pleased to accept.

Mr. Carr, our popular Deputy Commissioner, is shortly going home on leave. We wish him a pleasant journey and trust it will not be long before he returns to Chickmaglur.

Our thanks are due to Mr. Frank Clifford for representing us on the Local Board Fund, and it is to be hoped that he will consent to continue his services for another year.

During the year under review there have been four Committee Meetings, the Proceedings of which are laid on the table together with some correspondence on various interesting matters.

In conclusion, your Committee begs to place its resignation in your hands and asks you to elect office-bearers for the ensuing year.

The Honorary Secretary then read an address from Mr. E. C. Bolton, who was unable to attend owing to illness.

GENTLEMEN,—At the last General Meeting held in this Club in the 1st March, 1898, you paid me the high and, unexpected compliment of electing me your President for the year that has just drawn to a close, and before resigning my office, it is my duty to render you some account of my Stewardship such as it has been, and I wish to take this opportunity of expressing my own sense of my shortcomings in so responsible a position, which I must ask you to attibute rather to my inexperience than to any lack of interest in the welfare of your Association.

I feel thankful that it is not my painful duty as it was that of my predecessor, to have to allude to any deaths among your members during the past year, and trust we may enjoy immunity in this respect for years to come.

The dark cloud that hung over the planting industry this time last year threatening to bring ruin to us all, has, we may congratulate ourselves, to a considerable extent rolled by, and the crop just gathered may be considered satisfactory by us all, but—there is always a "but," gentlemen,—the prices at present ruling for our produce in the London Market have, to a great extent, discounted the good returns for the past year.

The report just read to you by the Honorary Secretary has reviewed in detail the several measures that have engaged the attention of your Committee during the year just concluded, and those brought forward and discussed prior to August last were embodied and given effect to in the proceedings of the U. P. A. at the Annual Meeting in Bangalore.

It will be unnecessary for me to remind you of the good work that is being done by the U. P. A. in the interest of every Planter of every product in Southern India, and I would refer any one who is at all sceptical on this point to the proceedings of the parent body, published annually. The two most important subjects that have engaged the attention of the U. P. A. for some time are the Currency Question and the South Indian Planters' Enquiry Commission. With regard to the former there is nothing to say. The Commission at present sitting has not yet concluded its labours, and some time must elapse before we know whether the present ruinous and fictitious value of the Rupee is going to be maintained by the Government of India, thereby bringing practical ruin on every producer in this country I hesitate, gentlemen, to ask you to consider what will be the future position of every one of us in this room with a 16*d*-Rupee and pea-berry selling at 95s.

With regard to the Enquiry Commission you have all seen by the papers that Government propose to amend Act V. of 1866, which has hitherto been practically a dead-letter. Your Committee at its last meeting went carefully through this Act, clause by clause, and I think I am only echoing their opinion in saying that the amendment will have to be of a very drastic nature to suit our requirements in any way. However, until we know definitely the precise nature and extent of the proposed amendment, it would be premature to pass final judgment. This, Gentlemen, is all I have to say; but, before closing my remarks, I would ask you to pass a cordial vote of thanks to the Honorary Secretary of the very able way in which he has discharged his duties during the past year, and I can only say the Association is very fortunate in having secured the services of one who gives so much of his spare time, and so much of his spare energy in promoting the interests of your Association, and I am sure we are all greatly indebted and obliged to him.

I regret extremely that I am unable, through ill-health, to attend your Meeting to-day to give an account in person of my year of office, which I need scarcely say is a better disappointment to me. In tendering my resignation I would add that my movements are somewhat uncertain, as I may be leaving for Home about this time next year.

But should there be any desire on the part of the members to re-elect me, I am willing to accept office, and do my best to justify the honour.

Mr. O. Scot Skirving proposed, and Mr. H. Edgington seconded a hearty vote of thanks to Mr. Bolton and Mr. Parton for their services as President and Honorary Secretary, dwelling on the time and thought they had most evidently given to the work of the Association during the past year. Carried *nem. con.*

The Committee was then balloted for with the following result:—*President*:—Mr. O. Scot Skirving; *Members*—Messrs. C. Brown, W. Maynard, F. Parton, H. Pilkington, C. Bonner, and F. Clifford.

Mr. O. Scot Skirving thanked the Members for the honour done him in electing him President and agreed to undertake the Presidentship for the year.

Read letter from Mr. G R. Oliver *re* the buying and selling of coffee advocating the use of English weights as a standard, stating that at present the Mangalore maund is 28¾ lbs. English, and a candy 576 lbs. instead of a maund of 28 lbs. and a candy of 560 lbs. It is true that the native lb. is 40 rupees weight and the English 39 rupees in weight, but even then the difference is not calculated correctly, and, as it is presumed that English weighing machines are used by all planters and firms, it is an anomaly that native weights should be used.

Resolved that the Honorary Secretary address the South Mysore Planters' Association, and, in the event of their agreeing to co-operate that all Curing Agents be addressed on the subject.

Tolls.—Proposed by Mr. F J. Parton and seconded by Mr H. Pilkington, that this Association regret that the Government of Mysore deem it necessary to place tolls on the various larger bridges in the district, tolls being considered by many as detrimental to the distribution of grain.

Resolved that Government be addressed on the subject.

Agricultural Chemist.—Mr. O. Scot. Skirving proposed a cordial vote of thanks to the Mysore Government for appointing an Agricultural Chemist, and expressed the very great pleasure Dr. Adolf Lehmann's presence at the Meeting gave him.

He hoped that Government would enhance the boon already granted in Dr. Lehmann's appointment by establishing his head-quarters in Chickmaglur. He hoped also that Dr. Lehmann would kindly favour the Meeting with any remarks which at this stage he felt disposed to make on the science of Agricultural Chemistry that might have bearing on the cultivation of coffee.

Mr. F J. Parton, in seconding Mr. Skirving's proposal, hoped that, after Dr. Adolf Lehmann had made arrangements with the Mysore Government for the construction of a Laboratory, that he would be able te spend a long visit in the coffee districts and see for himself the physical and climatic conditions under which our coffee is grown.

Mr Chairman and Gentlemen,—I thank you for the honour you have done me, in inviting me to be present at this Meeting, and I wish to take this opportunity of expressing to you, and to all the other Planters it has been my privilege to meet, my gratitude for the hearty welcome which you and they have given me.

It would be useless to mention to you the objects of my visit to this estate, but I ought to say that my present tour is only a preliminary one, and simply for the purpose of becoming acquainted with some of your difficulties.

As I have been barely two months in India, I am in a large measure unacquainted with your climate, and have examined your soil with a mamootie only, I know practically nothing of the peculiarities of the coffee tree, and have not had the opportunity of making a single experiment, so it would be presumptuous on my part to speak to you on any of the subjects which lie nearest to your hearts. I should, however, like to ask for your support and co-operation in the work which the Mysore Government has asked me to undertake.

The Laboratory work will suggest methods or, in other cases, test results, but a part of the work will have to be carried out on experimental plots, or on your plantations. I hope that some experimental plots will be established, yet the great difference in climatic and other conditions in the state, make the experiments conducted on your own estates, other things being equal, of greatest value to you. I should be glad therefore if you would undertake some experiments for yourselves, and I shall of course give you all the assistance that lies in my power.

The subject of fertilizers is one that has been much spoken of. As you know, plants are composed of compounds of various elements, some of which are essential, or necessary for the growth of the plant, others are simply accidental or taken up because they happened to be present in the soil. The plant is not dependant on the latter. It could grow, if they were not present, but if any of the former were missing the plant could not grow. I doubt of their being any soil in Mysore in which one of those essential elements is absolutely absent, still there are probably districts in which plants suffer, because their roots are not able to obtain as large a supply of one or other of these constituents as is necessary for the perfect growth of the plant. It suffers from partial starvation. As you are aware, this starvation is generally due to the absence of available compounds of either Potash, Phosphoric Acid, or Nitrogen; one or more of these compounds, or possibly some other compound like lime, may be lacking, or, in other words, the particular plant to be grown may be unable to assimilate a sufficient quantity, for there is a difference in plants as well as a difference in soils; some plants, for example, can readily assimilate from a particular soil all the Potash they require, while another crop, on the same soil, would readily respond to a Potash fertilizer.

For a crop, the peculiarities of which are well known, an analysis of a soil may suggest the particular fertilizer which would give best results, but a chemical analysis is by no means absolutely necessary for finding out the requirements of the soil. You can easily do this on your estates.

"The proof of the pudding is in the eating." If a crop is benefited by a certain simple fertilizer it is evident that the soil was lacking in that particular plant food in so far as this particular crop was concerned, but in order to ascertain whether a fertilizer has had a beneficial effect or otherwise we must leave a part of a uniform piece of land, treated in every other respect in the same manner, unfertilized. To my mind an advisable way of conducting these fertilizing experiments would be to select as uniform a piece of coffee (uniform shade-soil-coffee, etc.,) as possible,

apply to a narrow strip, say, 20 or 40 feet running straight down the hill, a certain fertilizer, leaving a similar strip next to this unfertilized, follow this by a strip to which another fertilizer has been applied. Every strip to which a fertilizer has been applied will thus be separated, by a similar strip, of unmanured soil, which will serve as a standard for comparison. I shall not take up your time with any further remarks on this subject, but hope you will do me the honour of writing to me when you have time. The extent and the object of the experiment will have to determine the particular fertilizers used, and the rotation in which they are applied.

I should esteem it an honor if you would permit me to consult with you whenever you contemplate making an experiment, however small it may be. While speaking of fertilizers, permit me to say that the more evenly and the more intimately it is mixed with the soil (other things being equal) the better the results are likely to be.

Of course you know that certain fertilizers, such as Sulphate of Ammonia and Lime, ought not to be mixed together, as it would result in a loss of Ammonia; and that Saltpetre ought never be applied either just before or during the monsoons, as a heavy shower of rain would cause it to be washed away. But I am not yet in a position to say what would be the best time of the year to apply it. This might vary for different seasons and localities and would depend to some extent on whether the coffee requires a period of rest during the hot weather or not.

On the subject of digging, mulching, and green manuring, I hope to have something further to say later on. If my first impressions are true, it would be well to try and allow the leaves to remain on the surface as long as possible.

But I must not occupy your time any further, as I hope to have the privilege of attending some of your future Meetings.

After a vote of thanks to Dr. Lehmann for his most interesting address, and the usual vote of thanks to the Chairman and Honorary Secretary, the Meeting broke up.

(Signed) F. J. PARTON,
Honorary Secretary.

SOUTH MYSORE

The Annual General Meeting was held at Munzerabad Club, Saklaspur, on the 30th ultimo :— PRESENT: F. Lonsdale Allen, R. A. Anderson, Graham Anderson, C.I.E., I. E. Butcher, W. L. Crawford, I. G. Crawford, Thos. Hunt, W. Lowder, C. Lake, A. R. Park (President), E. M. Playfair, S. Sladden, and R. Taylor. Visitors—Messrs. Barclay and Roffey.

The President informed the Meeting that owing to sudden and severe indisposition, the Honorary Secretary, Mr. J. A. Harris, was unable to attend, and called on the Vice-President (Mr. Playfair) to read the following Annual Report :—

GENTLEMEN,—It is my pleasant duty to report that the somewhat gloomy forebodings expressed early in the year have not been realised, and that the season, on the whole, has been a moderately good one. The advices of sales of East India that have reached us indicate a depressed state of the market, which, owing to the increasing production in different parts of the world, seems likely to continue for some time. The cardamom crop was above average, but prices were lower, ruling from Rs.50 to Rs.60 per maund. Leaf disease has been less prevalent than for some years past. Crop prospects for the coming year are favourable, and the rain, which fell in February, has not, on the whole, been prejudicial.

The PLAGUE.—The terrible outbreaks of this disease in several parts of the Province have been an appalling feature of the past year, and the efforts of Government to stamp it out have been watched by this Association with sympathy as well as anxiety. It is satisfactory to notice how suddenly it collapsed in Bangalore, and it is hoped there will soon be a subsidence in Mysore. We may congratulate ourselves that it has so far practically been shut out of Kadur and Hassan, and our thanks are due to the Deputy Commissioners of these Districts and to those working under them for their untiring efforts in establishing and working an effective organisation.

Should members complain that the Association has achieved little during the past year, I would ask them to remember that the executive purposely refrained from action which would in any degree have harassed Government at a time when it was contending with this epidemic.

S. I. P. E. C.—The Resolution of the Government of India have been before you for some weeks. From the time taken in coming to a decision, one might have expected a fuller and more conclusive statement. It is satisfactory, however, that the general tenour is favourable, but, as was pointed out by the Chairman of the U. P. A., it is of the highest importance that, should a labourer be allowed to rescind his contract, the forfeit money should be deterrent and that six months' notice should be given. As regards the extradition proposals, if Government will not recognise Breach of Contract as a non-bailable offence, I think Magistrates should be obliged to inquire into the *bona fides* of the security offered. This, be it noted, is of equal importance with respect to cases within the jurisdiction of the Courts issuing the warrants. There appears to be no such obligation laid down in the Criminal Procedure Code. As regards the "other safeguards" referred to, it is advisable that we should endeavour to prevail on Government to make these as simple as possible, as otherwise the procedure might be found so cumbersome as to deter employers from applying for warrants.

AGRICULTURAL CHEMIST.—The outcome of the various discussions that have taken place, as far as Mysore is concerned, is the appointment of Dr. Lehmann, the Dewan exhibiting in the matter his accustomed liberal-mindedness All those who are interested in Agriculture cannot fail to be gratified at the appointment of so highly-qualified a Chemist, and I hope shortly we may learn what course the Durbar intend pursuing as regards his work. Meanwhile he has lost no time in showing a desire to become acquainted with the local circumstances, as is seen by his present visit to this District.

U. P. A. S. I.—I refer you to the "Proceedings" for full particulars of the business of the year. Since their publication two matters of interest have been the subject of correspondence :—

(1) *The Classification of Coffee* :—As Reuter now quote Mysore as well as other qualities, our wishes in this respect have been met, and as regards uniform sizing, it appears that the meshes in use are as nearly similar as the variations in size and shape of beans will admit.

(2) *Co-operation.*—This idea is a natural result of bad seasons, low prices, and high exchange. Whether practical or not, it is worthy of consideration, but if any scheme should take shape, it seems to me it would be wise at first to limit its operations to distribution, or, say, to promoting the sale of our produce in India, England or elsewhere.

CURRENCY.—The report of the Committee will probably be issued in the course of the year. There seems little doubt that they will pronounce in favour of a fixed exchange, and a future gold standard.

ROADS AND COMMUNICATIONS.—*Railways.*—Sanction for the extension of the line from Arsikere to Hassan has not yet been received. The Durbar still appear to hold the construction of the line to the West Coast in contemplation, but what route, and what gauge will eventually be adopted, and when it is likely to be commenced, are matters for conjecture only. It was announced in the *Madras Mail* some months ago that a Company had been formed for the purpose of introducing *Light Railways* into the Province, and I addressed a letter to Government at the time urging them to support the project, but am without further information.

Roads.—I reported the bad state of the Nudigiri-Saklaspur road, with special reference to that portion lying between the river and the Waddenhulla bridge, and immediate attention was promised. The Executive Engineer of the Hassan Division informs me that five miles of the Hanbal-Devarunda road have been traced, that the remainder will be done this season, and then the project will be submitted for sanction. Work has been resumed in a perfunctory manner at the north end of the Saklaspur-Chickanhully road after a most inconceivable delay, but the matter of compensation as regards some of the lands through which the trace passes is not yet settled (as is, I believe, the case with the Hanbal-Devarunda road) which might lead one to suppose that the Land Acquisition Act had been rescinded! The extension of this road to Chickmaglur was approved by the District Board, and an estimate has been called for.

Anjur Bridge.—I regret to say that the site has not yet been decided on, and that further delay in the construction of this urgently-needed work is inevitable.

Post Office.—I have reported several cases of irregularity, but there has been no result whatever, and I have come to the conclusion that it is useless to attempt to expose P. O. shortcomings. Such a state of things is not creditable to the higher officials.

Police.—General inefficiency and dilatoriness on the part of the Police have not infrequently been brought to my notice during the past year. Of specific complaints, one is the delay in serving warrants, and the difficulties placed in the way of maistries and others sent with them. I have reported this, but can record no improvement. Another is the failure of Inspectors, Jemadars and Daffadars to visit estates during the picking season, and it is alleged in some quarters that even Constables fail to call on their beat. I suggest that a strong representation be made to the Inspector-General regarding the general inefficiency and unreliability of the Malnaad force. The horrible murder of a Baskull cooly, returning from Mudigiri, after cashing notes, calls for prompt and intelligent investigation. I trust the perpetrators will de apprehended and convicted, for, if this crime should go undetected, as several of a like nature have done, lawlessness will run rife and a feeling of insecurity prevail.

Forests.—I have written the Chief Conservator of Forests to enquire if grants of land for cardamom cultivation have been made in the forests of Kubbenhully, Bisleh and Kemphully, and await his reply.

Local Officials.—At the request of certain members I have laid a serious complaint before the Deputy Commissioner against the officials of the Saklaspur Taluq Cutcherry, and an investigation has been promised. Great inconvenience has been experienced in the Belur Taluq owing to the Amildar not being invested with second-class powers. I have urged these being given, but sanction has not yet been received. In important taluqs of this description it is essential that high-grade Amildars should be appointed on whom there need be no hesitation about conferring such powers.

Medical.—As soon as the authorities are less occupied with plague, the matter of a European doctor in Chickmaglur should be taken up, and a scale of fees to be charged by Medical Officers of all grades in the District be submitted to the Senior Surgeon. The Civil Surgeon has promised to provide accommodatien for in-patients in Saklaspur and Mudigiri hospitals.

Members.—Messrs. Stewart, Woodbridge, Daly, H. M. Playfair and C. F. de Salis have resigned, and Mr. S. J. Wilson has joined the Association.

Accounts—Are laid on the table and show a balance of Rs. 287-9-0 at credit. I beg to place the resignation of my office in your hands, and, as I shall be going Home in April, do not offer myself for re-election.

The Report having been unanimously adopted, Mr. Graham Anderson, C.I E., then made the following remarks :—

Gentlemen,—I feel sure that every planter in Southern India is rejoiced to find that, after nearly 30 years of negotiations, the Government of India has been fully impressed with the justice of all that has been represented after studying the elaborate Report of the Southern India Planters' Enquiry Commission. In due course the various Planting Associations of Mysore will doubtless have opportunities afforded of studying drafts of the improved legislative arrangements which are to be substituted for the unsatisfactory and unintelligible laws which have hitherto existed and which have frustrated the objects for which their provisions were specially extended to the Planting Districts, by encouraging unscrupulous individuals to become dexterously dishonest. We in Mysore are specially gratified to learn that the beneficial influences calculated to result from the peculiarly favourable position of the Mysore Province, which is entirely surrounded by the territories of the Paramount Power, will in the future cease to be neutralised by the absence of equitable and reciprocal facilities for the execution of warrants and extradition We feel sure that sympathetic consideration will be bestowed on all arrangements which will be made for this Province in which the conditions under which industries are conducted differ considerably from those existing in Ceylon, Assam and other Planting Districts. We may feel perfectly confident that, in consultation with the Durbar, the Government of Madras will not experience any insurmountable difficulty in arranging for the maintenance of cheap, prompt and efficient justice as between man and man, be he employer or employee, and that with the clearly defined object of restraining unscrupulous individuals nothing will be permitted which be distasteful to those who have constant congenial employment always to offer, or which will in any way unduly sacrifice the freedom and best interests of hundreds of thousands of the labouring peasantry upon whose welfare and work the developments of industrial success entirely depends.

The Accounts were audited by Messrs. Butcher and Lake and passed:—

The Proceedings of the last General Meeting were then confirmed and signed by the Chairman.

U. P. A. S. I. Subscription.—Resolved that the amount to be subscribed be left to the discretion of the Committee.

U. P. A. S. I. Delegates.—Messrs Graham Anderson, C.I.E., G. Horne, and W. L. Crawford were elected.

Honorary Members.—Carried by acclamation that the Deputy Commissioners of Hassan and Kadur, the Sub-Divisional Officer of Saklaspur, and Mr. G. E. Ricketts, Assistant Conservator of Forests, be invited to become Honorary Members.

Postal.—Proposed by Mr. J. Crawford and seconded by Mr. Playfair that the Association urge the authorities to retain the P O. at Bellagode.

Committee.—The present members were re-elected.

A vote of thanks to the retiring Honorary Secretary was proposed by Mr. R. A. Anderson, in the following terms, and unanimously carried:—

"We are about to say good-bye for a time to Mr. Harris, our Honorary Secretary, who leaves shortly to enjoy a well-merited holiday in England. I feel sure I merely give expression to the sentiments of all my brother-planters when I venture to wish him and Mrs. Harris a most pleasant voyage and every possible pleasure and happiness among other friends and relations at home. Mr. Harris has performed the duties of Honorary Secretary of our Association for several years past and has won the esteem, regard and gratitude of our community for his devotion to his work, his proverbial courtesy and the untiring energy with which he has maintained the usefulness of this Association. During his term of office he has had to deal with many most difficult subjects, and whether we remember his speeches or peruse his written communications, we cannot fail to admire him as a most tactful and painstaking man of business in every way worthy of the unqualified confidence which he has always enjoyed. I feel perfectly sure that the successes which have been achieved during the period of his incumbency may, in a very large measure, be attributed to the prudence and skill which have at all times characterised the negotiations which it has been his duty to conduct for the maintenance and improvement of planting interests generally. I beg, therefore, to propose a most cordial vote of thanks to Mr. Harris and to assure him that we one and all most highly appreciate the valuable services which he has rendered during his tenure of the office of Honorary Secretary to this Association."

Mr. Park was elected President and Mr. Playfair, Honorary Secretary.

A vote of thanks to the Chairman closed the Proceedings.

MARKET REPORT.

Per Mail advices of 31st ultimo.

COFFEE.

The *London Commercial Record* says:—There is no improvement to report in this market. Colory qualities of all descriptions continue in fair request, but there is still a downward tendency for less desirable samples, and sales are made with difficulty. With regard to East India the feature of interest has been the first important sale of Naidoobatum; there was a good demand for the bold which sold at full prices, but great irregularity for the second size, some of which met with good competition at very full rates, whilst others were cheap. Costa Rica and Guatemala, which comprised the bulk of the catalogues, experienced a further fall of 1s. to 2s. per cwt A quiet tone has prevailed in futures, and prices shew a slight decline, closing as under:—

London	Santos	July delivery	29s 0d
New York	No. 7 Rio	„ „	5.15 cents
Hamburg	Santos	„ „	29 pf.
Havre	Santos	„ „	35 francs
Holland	Good ordinary Java		27 cents.

Imports Deliveries and Stock of Coffee in London are as follows:—

	Stock.		Imports.	
	1899.	1898.	1899.	1898.
Tons	14,976	11,655	8,990	10.183
	Home Consumption.		Export.	
	1899.	1898	1899.	1898.
Tons	3,519	3,422	4,902	4,702

The preceding figures exhibit—

In the Imports a decrease this year of 1,193 tons
Home Consumption an increase of 97 ,,
Export an increase of ... ... 200 ,,
Stock an increase of ... ... 3,321 ,,

This week's auctions have passed as under:-

East India.—1,384 bags offered and mostly sold as follows: *Naidoobatum*, smalls 41s 6d to 47s 6d, middling to good middling 61s to 75s 6d, bold to extra bold 92s to 106s, pea-berry 85s 6d to 106s; *Mysore*, smalls 39s.

Costa Rica.—7,857 bags catalogued and about 4,000 bags sold—smalls 28s to 48s 6d, good to fine fine ordinary 34s 6d to 46s 6d, low middling to middling greenish colory 48s 6d to 60s, good to fine middling colory 62s 6d to 89s 6d, bold 73s 6d to 88s. very fine blue 92s to 101s 6d., pea-berry 51s to 103s 6d.

Guatemala.—1,039 bags mostly sold—smalls 26s to 27s 6d, fine fine ordinary 42s 6d, low middling to middling greenish colory 47s to 54s, good middling 58s, good bold greenish colory 75s 6d to 77s 6d, fine hard deep blue bold 92s, pea-berry 83s

Colombian.—987 bags offered about half sold - smalls 23s 6d to 32s, fine fine ordinary 44s to 47s, low middling to good middling bright gray 49s to 56s 6d, good middling faded gray and foxy 60s to 61s, bold colory greenish 64s 6d to 68s, bold mottled gray 70s 6d, good blue 75s 6d, pea-berry 40s to 53s.

Mexican —Of 199 bags offered only 40 bags sold—smalls 25s 6d, good bold blue 80s, pea-berry 58s 6d to 84s.

Venezuelan.—71 bags mostly sold—middling soft blue 54s 6d, bold ditto 69s 6d.

Salvador.—13 bags bought in.

Porto Rico.—167 bags withdrawn.

Bolivian.—35 bags bought in.

TEA.

Indian.—On account of the near approach of Easter, auctions were held only on Monday, when 21,100 packages were offered, compared with 30,700 packages in the previous week and 27,800 packages at this period last year. Buyers were very eager to secure all descriptions under 9d per lb., which were again dearer, while medium to fine Pekoes met with better competition. The enquiry for Broken Pekoes on the other hand continues somewhat limited, particularly for tippy parcels over 1s per lb., which now look comparatively cheap.

For 17,700 packages on Garden account $9\frac{3}{4}$d per lb. was obtained versus $7\frac{1}{2}$d per lb. for 19,400 packages, and 8d per lb. for 14,900 packages in 1898 and 1897 respectively.

In the month the following have been printed on importers' account:—

	1899.	1898.	1897.
Pkgs	127,500	129,600	143,000

which will bring the total of the crop sold to date to, say, $1\frac{1}{4}$ million lbs. over that disposed of to the 31st March, 1898.

Ceylon.—The quantity brought forward was moderate, comprising 19,000 packages, contrasted with 21,000 packages on the 21st instant, and 26,500 packages a year ago.

There was very spirited bidding for all sorts, especially the lower grades which in most instances advanced $\frac{1}{2}$d per lb. Medium, both leafy and broken, also attracted more attention, and though quotations were somewhat irregular, they participated in the upward

movement. Fine and finest were in small supply and about maintained their value.

The average is 9¼d per lb. On the 23rd instant it stood at 8⅞d per lb. and in 1898 it was 7¼d per lb.

In March the following passed the hammer:—

	1899.	1898.	1897.
Pkgs.	92,900	124,900	111,000
	(Avge. 8⅞d per lb.)	(Avge. 7¼d per lb.)	(Avge. 8¼d per lb.)

Java.—In the absence of sales there is nothing special to report.

For the month the total offered was:—

	1899	1898.	1897.
Pkgs. ...	3,900	6,500	6,500
	(Avge. 7¾d per lb.)	(Avge. 6d per lb.)	(Avge. 6¼d per lb.)

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report dated March 30th, 1899, says:

QUANTITY BROUGHT TO AUCTION IN LONDON

From 1st June to Date.

	Indian.	Ceylon.	Java.
1898-1899.	1,436,994 pkgs.	943,058 pkgs.	38,463 pkgs.
1897-1898.	1,416,651 „	1,002,222 „	35,534 „

21,158 pkgs. Indian
19,410 „ Ceylon
— „ Java
} Total 40,568 packages were offered in public auction this week.

Particulars of the quantities of Indian and Ceylon Tea re-exported from Great Britain are shewn below. It must be remembered that many of these countries receive a considerable portion of their supplies direct from India and Ceylon.

† S. America *probably the bulk of Tea exported to Germany was for Russia.

Indian. A further rise has taken place in the market, anything up to 9d. showing fully ½d advance upon last week's rates, with considerable eagerness in bidding. Teas above this price were very firm Avgs.:—"Ass. From. T Co. Khobong," 1/2. "Runglee Rungliot," 1/1¾; "Con. T & L Jafflong," 1/1.

Ceylon. Hardly anything is now obtainable in whole leaf under 8d, the market having advanced fully ½d. on all Teas up to nearly 10d per lb, with somewhat excited bidding, medium brokens now participating in the improved demand. Avge. for wk. 9·30d., Agst. 7·15d. same wk. 1898.

Ceylon Tea sold on Garden Account, 1st Jan. to date 1899, 263,258 pkgs., av., 8·40d. 1898, 294,636 pkgs., av., 7·64d.

Bank Rate 3 per cent. Exchange on London three months sight:—Calcutta 1/4⅛ Colombo 1/4⅛.

IN THE UNITED STATES.

The *American Grocer* of 15th March, says:—Prices obtained at the auction sale on Wednesday last did not sustain the open market on Blacks. Pingsuey Greens were firm, but the offering was light. Moyunes showed strength on all grades. Amoy Oolong fell off ½ @1c, as did Foochow. Formosas also declined. India and Ceylon steady. No change was manifest in Japan.

IN CANADA.

The tea market, particularly in regard to Ceylons, continues to gather strength, and the fact is becoming more and more emphasized that, not since 1879, has it been in such an interesting condition.

With low-grade teas costing what they are to-day, profit in the 25c. packet tea must be getting to an unsatisfactory point indeed.

COCOA.

At Tuesday's public sales 5,766 bags were catalogued, which elicited but a very moderate enquiry, only 1,950 bags selling at about steady rates. Of 1,585 bags Trinidad offered 400 bags sold, fine red 75s. 6d, fair to good 71s 6d to 74s, common dark 63s. 47 bags Grenada partly sold at 71s for fine. 45 bags Demerara about half sold at 73s for fine red. Of 158 bags Dominica only a few bags sold at 65s 6d. 496 bags Bahia brought forward and 80 bags sold at 65s for common grey. 30 bags Surinam found buyers at 70s to 72s, being fully late rates. Of 241 bags Samana 80 bags sea damaged sold at 64s 6d. 190 bags Guayaquil were catalogued, of which 30 bags sold at 71s for greyish Caraquez. 2,803 bags Ceylon about half sold at 76s to 82s for good to fine bold red, 69s to 74s 6d for middling to fair, 64s 6d to 68s for common to fair Native, 60s to 65s 6d for pickings, and 58s 6d to 60s per cwt. for common dark.

PEPPER.

Black—The market is firm and prices have sided in sellers' favour. About 200 tons Singapore are reported sold, viz., fair quality on the spot at 5 3/16d to 5¼d, April-June shipment at 5 9/16d, June-August at 5 9/16d, and July-September at 5⅝d.

At auction on Wednesday 160 bags Aleppy were bought in at 5½d for good heavy; 11 bags sea-damaged Singapore realised 4¾d per lb.

White is also dearer, but is quiet at the close. About 100 tons have been sold, viz., fair Singapore on the spot at 8¾d, April-June shipment at 8⅝d, May-June and June-August at 8¾d; fair Penang on the spot at 7⅞d, and June-August at 8¾d to 8¼d.

At public sale on the 29th inst, 101 bags Singapore retired at 9d to 10d, and 33 bags unlimed Penang at 8½d per lb.

GINGER.

Cochin.—There are no signs of improvement in demand, and prices have again experienced a fall. 801 bags 79 cases offered and 275 bags sold—medium and small, partly bold bright Calicut washed 26s, brown rough Calicut Sorts partly mouldy 22s to 22s 6d, smaller ditto part shrivelled, mouldy 21s to 21s 6d, and tips ditto 18s 6d per cwt.

Jamaica in fair request at satisfactory prices. 531 barrels, &c., offered and 450 barrels, &c., sold, as follows :—Medium part bold washed 72s 6d to 79s, leaner and darker ditto 66s to 69s, ordinary lean dark to good ordinary 58s to 65s per cwt.

INDIA RUBBER.

The market is quiet with sellers of fine Para at 4s 4d. Very little business done this week.

CARDAMOMS.

The Ceylon shipment, from January 1 to February 28 were :—

	1899.	1898.	1897.	1896.
Lbs.	95,827	81,034	70,585	59,153

and for the week ending March 7, 1,282 lbs. were shipped.

QUININE.

Manufactures advanced their prices last Saturday, German brands in 100-oz. tins and 1,000-oz. lots being raised to 1s 9d., Imperial and Whiffen's the same, but Howard's was raised by 4d. per oz. to 1s. 10¼d. in tins (100 oz), and 1s. 11d. in 1-oz. bottles. Other salts are advanced 3d. and 4d. per oz. The speculation market has been changeable, a reaction setting in when it became known that the net result of the Amsterdam auction was not so brilliant as was imagined. On Friday confidence was restored, and a good business was done at the following rates :—B. & S. or Brunswick, 1s. 8¾d. to 1s. 9⅛d. spot; April delivery, 1s. 9¼d., and up to 1s. 10¼d. for October. On Monday the market was quiet in anticipation of the London bark-sales. These gave a renewed stimulus to the market, and on Tuesday about 100,000 oz changed hands at 1s. 9d. to 1s. 9¼d. on the spot, May delivery at 1s. 9¼d. to 1s. 9½d., August 1s. 9¾d. to 1s 10d., and October 1s. 10d. to 1s. 10¼d. To-day the market is very dull, and spot sales have been made at 1s. 8¾d., with no indication at the close of further change until after the holidays. From the United States we hear that there has been a good daily demand—*e.g.*, the turnover on March 17 was 40,000 oz. all for foreign account. Manufacturers there are practically out of the market, and first-hand quotations are nominal.

Production of Quinine in U. S. A.—The *Chemist and Druggist* writes :—In our issue of February 25, page 356, we put the production of quinine in the United States at 3,333,000 oz. annually. This was on the authority of the manager of Messrs. Powers & Wightman, Philadelphia, who gave the output of quinine by American manufacturers in 1897 as 3,336,168 oz. A well-informed New York correspondent writes to us on March 8 "that the quantity manufactured in the States at most is not over 1,500,000 oz. It certainly is not 2,000,000 oz. If the bark itself is taken on a 4-per cent. basis, which would be ample, it could only produce 2,000,000 oz., but one must not forget that a great deal of the bark imported into America is used for pharmaceutical purposes." The imports of bark in 1897 were, we find, 2,537,693 lbs., so that, (1) Messrs. Powers & Wightman's manager is wrong as to quinine-output, or (2) American quinine-makers sell foreign quinine as their own.

CINCHONA BARK.

Although the high expectations entertained with regard to the last Amsterdam sale were not altogether realised, nevertheless the demand was tolerably brisk. Concerning the 3,239 kilos. of sulphate of quinine withdrawn, about 562 kilos had been sold prior to the sale, as we mentioned last week, this leaving only 2,677 kilos. unsold. The following amounts of various descriptions were offered: *Succirubra*, 147,458 kilos.; *Ledgeriana*, 331,467 kilos.; Calisaya, 575 kilos.; *Officinalis*, 1,157 kilos; *Hybrid* and other sorts, 56,419 kilos. Of these amounts 45,741 kilos. consisted of root bark. Government bark formed 31,578 kilos., and Private bark 505,198 kilos. The maximum price of *druggists'* bark was 83 cents. not as misprinted 183 cents.

The London March auctions took place this week. They were awaited with great interest, and came quite up to expectations. The bidding was keen, especially for the richer bark, which fetched remarkably high prices, and the result was an advance of 12 per cent. on the Amsterdam auctions of last week, and over 45 per cent. on the last London auctions, the unit coming out at 2½d. against the equivalent of about 2d. in Amsterdam and rather over 1⅝d. at the last London auction. Out of 3,446 packages containing nearly 600,000 lbs. of bark, 2,294 packages containing nearly 400,000 lbs. were sold. The following shows the purchases of the chief buyers stated in pounds of bark :—

Howard's.	Mannheim and Amsterdam.	Brunswick.	Frankfort and Stuttgart.	American and Italian.	Paris.	Imperial.	Miscellaneous.	Total Sold.
lbs. 64,599	lb. 49,076	lbs. 30,646	lbs. 35,365	lbs. 205,728	lbs. 2,268	nil.	lbs. 6,637	lbs. 392,319

The prices of the various descriptions were as follows: *Calisaya* Bolivian cultivated quill sold at 6d. to 1s. 2½d. Bolivian flats at 8⅝d. to 1s. 1⅝d.; Bolivian chips at 1s. 1¾d. *Ledgeriana* : Ceylon chips and shavings sold at from 4⅞ to 1s. 1⅜d.; East Indian sold at 7¼d. to 10⅞d.; Java sold at 5½ to 1s. 3½d. *Officinalis*: Ceylon chips and shavings sold at 7d. to 11¾d.; East Indian chips and shavings at 3½d. to 1s. 0¾d. *Succirubra* : Ceylon chips and shavings sold at 4½d to 11⅜; East Indian, at 3¼d. to 9¾d.; South American, quill and chips at 7d. to 7⅞d.; African, 4½d. to 8¾d. The offerings were divided as follows : *African*, 351 packages ; *Ceylon*, 649 packages.

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N. B.—Remittance, should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday the 5th proximo. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Kotagiri. 21*st April—Rainfall.*—On 14th in. 0·20; 15th 0·53; 16th 1·20; 17th 1·60; 18th 0·12; already in. 7·78 this month against an average due of only in. 4·07 for the whole month of April. It is impossible to tell now what damage has been wrought on the coffee by this abnormal fall. It is feared that six weeks hence will reveal a sad tale. To-day weather is holding up a bit and shows signs of sunshine. We don't look forward during the whole of the S.-W. Monsoon for as much rain as we have had last ten days.

CINCHONA AND QUININE.

The movements of Cinchona and Quinine during the last few months have attracted a considerable amount of attention in the commercial circles directly interested, and among cultivators of the bark. From the chief markets of the world have come periodical reports that have been eagerly looked for, and cause and effect and prospects have been discussed with very keen interest. The recent boom has calmed down for the present, and prices have receded; but there is still a powerful undercurrent setting towards a fully maintained, if not an enhanced, level of values. The amount of quinine consumed annually is enormous. Quantities are mostly declared in *ounces*, but they mount up to tons. The *Chemist and Druggist* states, for instance, that at the Amsterdam auctions of 23rd ultimo the amount of bark sold was about 400 tons, and that this represented over 20 tons of sulphate of quinine. This for one auction, and there are ten auctions during the year. If, therefore, the tonnage mentioned were an average one, it would mean that over 200 tons of quinine was sold and bought in Amsterdam in the year. As a matter of fact,

says our contemporary, the quantity has considerably exceeded the 200 tons of late years. In 1898, 238 tons were sold; in 1897, 230 tons, and 258 tons in 1896. The average of five years is nearly 218 tons a year, and this at Amsterdam alone and only at the public auctions. To this there has to be added an unknown quantity, representing what is sold privately between the auctions. Then, though Amsterdam is the most important market, London still sells more bark than the equivalent of all the quinine consumed in the United Kingdom The same contemporary remarks on this point that 2,296 tons of cinchona bark were imported into Great Britain in 1898. Some of this, of course, was made up of a fraction of the bark we have already noted as sold in Amsterdam. The rest came mainly from India, Ceylon, Africa (*viâ* Portugal) and South America. Then there are United States, France and Italy, all of which have quinine factories, and buy bark in Amsterdam and London, and sometimes import direct from the producing countries. If one wished to get at accurate figures the simplest plan would be to take the exports from Java, India, &c., and ignore European and American imports. If we did this for the year 1898 we should see that, roughly, Java exported 12¼ million pounds of bark, India three million pounds of bark, Ceylon 975,000 pounds, Africa 250,000 pounds, and South America 220,000 pounds, a total of 16,695,000 pounds or 7,408 tons. Remembering the difference in the content of the barks, and estimating roughly, but, neverthless, quite near enough to make no difference for present purposes, we see that in 1898 the producing districts sent to the manufacturing centres 325 tons of quinine locked up in bark. And the actual consumption probably represents at least 300 tons, if not the full 325 tons referred to.

It has been proved by the course of prices that the greatly-increased shipments of last year were not enough for the world's needs, even though manufacturers were also able to draw upon fairly heavy stocks of bark in hand at the beginning of the year. In fact, 325 tons of quinine was not enough for the world's demand. There is depression just now, but this is merely a natural reaction after a sudden rise. The cinchona position does not favour "bears," for although the Java exports in March are quite up to the average, they still leave a 15 per cent. shortage on the quarter's supplies, and it is reported that every scrap of bark available in Java has been shipped, owing to the high rates paid for bark. The temporary depression is due to no falling-off in consumption, but to a slackening of operations on the part of speculators There is an important demand to be expected from America, too, for American purchases have not been heavy, although it is certain that stocks there lately reached an unusually low level. On this point the *New York Commercial* recently stated that in New York the available supply of quinine was said to be practically exhausted, but it was probable that small lots might yet be obtained. Several parcels had arrived from Chicago, St. Louis, Baltimore, and other points. All had been purchased previously for foreign account, and had already been shipped to London. Stocks were very much depleted, and it was probable that the consuming trade might find itself short of quinine when the regular spring consuming demand set in. Deliveries were still being made on old contracts at low prices, but those contracts would all expire about the middle of April, and then the full extent of the improvement would be felt. "There are some in the trade," said the New York paper, "who look upon the recent rapid upward movement in prices as a speculative bubble which is liable to burst at any moment; but a number of conservative dealers believe that the so-called bubble is a solid ball, and that there are good and substantial reasons for the advance.

We chronicle a quieter market this week There have even been allusions in Home mail advices to something in the nature of "a small panic"—because after jumping up 8*d.* prices receded 2*d.* or so. Hamburg reports a quieter disposition, factories holding out fairly well, but second-hand buyers are inclined to realise their profits. In New York quinine was quiet, makers offering at 40 cents. (1*s.* 8*d.*), second-hand sellers at 36 cents. (1*s.* 6*d.*); but cinchonidine had advanced to 20 cents. (10*d.*) after a good business (30,000 oz.) at 18 cents. (9*d.*) per account of manufacture. Latest London reports show that on March 29th, the second-hand spot price for German sulphate in 100-oz. tins in 1,000-oz. lots or more was 1*s.* 8¾*d.* On March 30th a fair business was done at 1*s.* 8¾*d.* to 1*s.* 8⅞*d.* on the spot, up to 1*s.* 9⅛*d* to 1*s.* 9¾*d.* October delivery. The next week's business opened on Tuesday with marked depression, small spot sales being made at 1*s.* 7½*d* This easier tone prevailed on Thursday and sales were again effected at that figure, but the market closed at 1*s.* 8*d.* and 1*s.* 9*d.* for August delivery. OnFriday there was a complete absence of buyers, and the closing price was nominally 1*s.* 8*d.* per oz. Telegrams also show a fall in the value of Cinchona, but there is no sign of serious weakness in these figures and whatever may be the fate of speculators the quinine market appears to us to offer every encouragement to the planter of cinchona bark. He can afford to smile when he sees how a few thousand pounds of bark sway the markets at home. There is, on the whole, a steady demand, and the supply does not appear to be equal to it.

THE COFFEE MOVEMENT IN THE UNITED STATES.

The *American Grocer*, in giving its usual monthly remarks on the Coffee Movement, states that if allowance is made for February being a short month, the deliveries of coffee, while not as heavy as in December and January, were greater than for any month since May, 1898, and only 13,851 bags smaller than for the same time in 1897. The following table shows the deliveries in the United States for the first two months of 1899, as compared with the same period in 1898:—

	1899.	1898.
January	568,087	560,754
February	431,321	452,505
Total two months...	999,408	1,013,259

After the excessive withdrawals, in anticipation of a duty, in the spring of 1898, deliveries fell far below the monthly average, and did not recover until the fall of 1898, growing larger each month since October. In 1896-97 the average monthly deliveries were 424,049 bags, rising in 1897-98 to 503,023 bags, due to the carrying of heavy stocks out of licensed warehouses; and yet the monthly deliveries for 1898-99 average 497,435 bags, or within 5,591 bags of last year's record. There seems to be only one conclusion, *viz.*, that coffee consumption has largely

increased and is gaining fast. In Europe the January and February deliveries were 1,179,908 bags, against 1,227,304 bags for the same months in 1898. Unfortunately for planters, however, the production has not fallen off to an extent sufficient to warrant the belief that supplies will soon fall short of the world's requirements. Although the total visible supply of the world on March 1 was 6,522,044 bags, against 6,024,928 bags at corresponding date in 1898—a gain of 497,116 bags, but 78,719 bags less than January 1, 1899, and 606,756 bags smaller than on November 1, 1898, when the total visible supply reached the highest point on record, or 7,128,800 bags; and although the total receipts of Rio and Santos coffee from the crop of 1898-99 (July to February) were 6,891,000 bags, or 1,555,000 bags less than for the same time in 1897—99, but 65,000 bags more than in 1896-97, our New York contemporary concludes that there is not a sign to indicate that coffee is not to continue to sell at very low prices for another two years. The visible supply is equal to about one-half the world's yearly crops; and, if the yield in 1899-1900 (as now estimated) beats the record, we may look from now on for a steady increase in the visible supply.

London advices are certainly not much more encouraging. The last Coffee auctions of which we have particulars showed a great excess of supply of all descriptions compared with the moderate demand; they dragged along for days without much benefit to all concerned. Prices declined further, and only such lots enjoyed any attention as were obtainable at buyers' idea of prices. But London is often a poor buyer when its sons are busy making plans for a coming Bank holiday.

CURRENCY AND TEA.

Mr. G. L. Acworth has returned from England, and has been caught *en route* by a busy and very badly informed Colombo reporter, who has sounded him as to his opinions on the subjects of Currency and Tea. It is annoying to be told that one's name is "well remembered," when the man who makes the statement can neither spell the name correctly nor state the real connection in which the name is remembered. The reporter of the *Times of Ceylon* welcomes "the return of Mr. G. L. Ackworth, who was formerly Chairman of the Southern Districts Planters' Association of India." The Editor adheres to the incorrect spelling of the surname, and varies the other nomenclature by saying "formerly Chairman of the South Indian Districts Planters' Association," another Association of which we, in Southern India, know nothing. We give elsewhere the reporter's account of his interview with Mr. Acworth, though that gentleman has not allowed himself to be "drawn" very much. The last touch, about Mr. Acworth being *unable* to give much information with regard to his own estates, is very pretty. As if every inquisitive interviewer had a right to question a man as to his private property and affairs!

Mr. Acworth's remarks lead us to suppose that he looks forward to a 1*s.* 4*d.* rupee, a fairly good time for tea during the next six months, and then a recrudescence of Chinese competition. It is not a very sanguine view, but it is certainly a prudent one. Above all things it is to be hoped that the promise of a spell of increased prosperity will not cause tea-planters to go in fully for coarse plucking or for large extensions so as to increase their outturn. Mr. Acworth touched upon the former of these two points, and our pleasure at welcoming him back is enhanced by the feeling that he will give wise counsel on both. We see he means to stay as short a time as possible. It is to be hoped that this will not be too short to permit of his presence at the next annual meeting of the U. P. A. S. I. The absence of Messrs. Parsons and J. A. Harris (and seemingly Mr. Jno. G. Hamilton also) will be greatly felt unless there is some very powerful counterpoise.

MR. H. O. NEWPORT IN QUEENSLAND.

The March number of the *Queensland Agricultural Journal* contained the following:—"The extension of the coffee-growing industry in Queensland, especially in the Northern portion of the colony, having drawn the attention of the Department of Agriculture to the necessity for instructing planters, present and prospective, in the best methods of conducting planting and curing operations, the services of Mr. Howard Newport have been engaged. Mr. Newport is a coffee-planter of eleven years' experience in India, where he successfully managed a plantation at Melrose, Yercaud, in the Madras Presidency. He also visited Ceylon, where he applied himself to the study of coffee culture in that island. He is at present visiting all the districts where coffee is being grown, and will advise planters on the best methods to be adopted in all branches of the industry in order to ensure success." Since then, however, things have changed considerably, for owing to the death of Mr. Cowley, the late Curator of the Kamerunga State Nursery, Mr. Newport has been temporarily appointed Curator, without prejudice, apparently, to his duties as Instructor in Coffee Culture. This will give him excellent opportunities to pursue practically some of his favourite studies, while it will enable him to keep in touch with coffee-planters. The chief difficulty in these gentlemen's paths appears to be the scarcity of labour, especially in the South. But they have a climate that a white man can work in, and when we learn on good authority of a crop of 28 cwt. off 600 odd trees, and block only "a bit shuck" after it, we cannot but believe that soil and climate are favourable to coffee. "An easy 10 cwt. on it now with a promise of 20 next year; no leaf disease, and no bug," reads like an interpolation for "Alice in Wonderland," but we are assured that it is not an exaggerated statement. The *Cairns Argus* says of the industry:—"The recent consignment of Cairns coffee sent to London, to test the value, by the Department of Agriculture, brought only 48/- per cwt., but with the assurance that it would have brought 75/- two years ago—in other words, that this coffee was equal to any brand placed on the London market. (sic!) Or at least it is capable of being made so. The plants want maturity, which is no fault of the Cairns coffee planters." It looks as if Mr. Newport had secured an appointment in connection with an industry that is full of promise. If the Labour difficulty be overcome, there is no visible reason why Queensland should not produce coffee largely and—make a profit out of it.

A PRIZE ESSAY.

In continuation of our efforts to induce planters to write—as only planters can write—on practical questions connected with their industry, we confirm the offer made in our issue of 25th ultimo of

A New Prize
of
Rupees one hundred

for the best essay on "The lines that a Madras Labour law should follow." The aim of writers should be to point out, *briefly* and *concisely*, the lines they think the Madras Government should follow in amending Act V. of 1886 in accordance with the resolution of the Government of India anent the report of the South of India Planters' Enquiry Committee. The following are the rules of the competition :—

1. Write on one side of the paper only.
2. Give your name in full, and state address (not for publication, except in the case of the winner).
3. Be as brief and concise as possible.
4. Cite your authorites where possible.
5. Mark your MSS. "Prize Essay Competition"
6. Submit not later than 20th May, 1899 (in Madras).

It should be clearly noted that all essays sent in will be the absolute property of *Planting Opinion*, and that that the proprietors will have the right to publish them, in full or abridged or revised, in *Planting Opinion* or elsewhere, and to republish in pamphlet or book form. No limit of length is fixed, but brevity is strongly urged. Rs. 100 will be remitted to the winner immediately after publication of the prize essay.

COOLY CRIMPING IN CEYLON.

Our Colombo contemporaries have lately devoted a good deal of space to correspondence and edititorial remarks on alleged "wholesale crimping of coolies up country." It is asserted that a number of South Indian planters—whether two or four is far from clear—are working at different points up country, with a good deal of method, "regardless of expense," and on a very large scale. In more than one quarter the number of coolies it is desired to take over to South India is stated to be between seven and eight thousand; and demand is said to run chiefly on Arcot coolies. To obtain them *viâ* Ceylon appears to be a roundabout procedure, but the inference is that the Travancore planter prefers the Arcot cooly who has had experience on Ceylon estates rather than the same individual in his pristine simplicity. However this may be, if the stories referred to have any foundation in truth, it would seem probable that certain Travancore planters would bring a reproach upon themselves and their fellows. Fair competition in the labour market is right and proper, but the stories referred to point to more than this, and we cannot suppose that South Indian planters, as a body, approve of offering excessive terms in order to attract labour away from estates on which it is employed. The district for which the coolies are required is said to be 25 miles from Madura, so there should be no great difficulty in localizing the complaint made. If it be a just one, we trust that steps will be taken to mark the general sense of disapproval with which we feel sure planters must regard the operations alluded to. A little ostracism might have a wholesome effect, and we would suggest that no planter should be admitted to membership of a District Planting Association if he is known to go beyond the bounds of what is generally considered fair in his efforts to procure a sufficient supply of labour.

We allow the above remarks to stand, though since they were penned Ceylon accounts have, we are glad to say, been modified considerably. The *Times of Ceylon* now states that it has been assured by Mr. A. Fairlie, who represents Messrs. Finlay, Muir and Co. in Ceylon, that the only foundation for the reports to his certain knowledge was the fact that Mr. Maitland S. Milne—who has recently gone over to North Travancore, after having had charge of Tyspane estate, Kotmale, while the permanent superintendent, Mr. J. A. Martin, was in England last year—wanted a gang of coolies from that estate whom he knew; and that his younger brother, Mr. A. B. Milne, who had been under him on Tyspane, and is now in the Nawalapitiya district, had arranged, with Mr. Martin's consent, to take over 40 coolies, whose total advances come to Rs.1,250 or Rs.31 per head. This was all that had been proposed; and Indian coolies from Ceylon, whether heavily indebted or not, would, it was pointed out, as readily return to their villages as labourers recruited in South India itself. Mr. Fairlie added that the gang named had not been actually taken on yet; and he had just written to Mr. Davidson in Travancore—who while in Ceylon recently was entirely in Mr. Fairlie's company, and did no "recruiting"—to say that, if even taking over a single gang upset the labour market in Ceylon, it was a question whether it were not better to abandon the idea. The little "storm in a tea basket" is probably over by now, but doubtless the Ceylon kangany has managed to turn it to profitable account. He appears to be a not inexpert "wrecker."

MATÉ.

Writing in the *Lancet*, Dr. Gordon Sharp has a good deal to say about maté, and what he says makes it pretty clear that the so-called Paraguay tea is never likely to become popular as a beverage. Dr. Sharp's object was to place before his dyspeptic patients a beverage which would be a good substitute for ordinary tea, and, as coffee and cocoa had been tried and found wanting, he turned his attention to maté. First he tried it upon himself, and although he appears to have commenced the experiment in high hopes of success these were soon doomed to disappointment. He found the beverage anything but pleasant to the taste, and repeated draughts of it, duly seasoned and extending over a week, produced in him feelings of the utmost disgust, the persistent taste being not the least disagreeable symptom. He also tried an etherial extract of the maté, and the following is his graphic account of the results:—"In an hour there was nausea with saliva rising into the mouth, and vomiting was only with a great effort averted. This sensation continued more or less for six hours—that is, till bedtime. Two hours after taking the extract there was great discomfort in the region of the transverse colon, but no diarrhœa. These conditions were crowned by a sleepless night and a headache next morning which disappeared after breakfast. The aroma of maté is a constant companion all the day following the taking of the extract. The extract may have had some slight diuretic action. The maté remaining after exhaustion with absolute ether was ex-

amined and was found to contain caffeine and tannin as its chief constituents. An infusion tasted strongly of tannin and was found to be a most insipid beverage, showing how little caffeine has to do with the exhilarating properties of the caffeine-containing plants, as in the case of China tea. There can be little doubt that maté has not a flavour peculiar to itself, but has simply that of the holly order to which it belongs, for some ordinary holly-leaves were roasted, and their aroma was similar to that of maté." In fact Dr. Sharp himself did not acquire a taste for maté, and as for his patients, he says they preferred dyspepsia! No wonder, for he remarks :—"The flavour lingers, and cannot be described in words. There is little hope of maté finding favour with those who have once tasted China tea." Perhaps this may set at rest the minds of any tea planters who have heard that the *Südamerikanische Rundschau* (*South American Review*) predicts a future for Paraguay tea, and states that Herr Alfred Heiniger recently left Berlin for Asuncion on a mission of inquiry regarding this product. The chief object of Herr Heiniger's journey is to ascertain whether a monopoly of the maté export to Europe on the part of a German syndicate would be profitable. He would have discovered what he wants to know if he had stayed quietly at home and read the *Lancet*.

NOTES.

The Currency Committee. We give to-day an abstract from the *Madras Times* of the second volume of evidence.

"The Green Hills." A tale of the Shevaroys is told by a writer in the *Madras Times*. We give it on another page for the delectation of readers on the "Green" and the "Blue" and other hills.

Cinchona Bark. We hear, says the *Ceylon Observer*, of 400,000 lb. of six per cent. cinchona bark being sent off from one property in Southern India. This, at present prices, should bring a very satisfactory return.

North Darjiling Tea. Says the correspondent of a Calcutta contemporary :—Good teas are being made generally and are more flavoury and brisker than is usual at this time of year. Coolies are plentiful, and everyone of them is on plucking.

Breaks and Packages. The *I. P. G.* advocates universal adoption of half-chests for tea, except for fresh markets, when it thinks that quarter-chests would be preferable, and that it considers the breaks might be reduced to 20 packages and upwards. The idea is to "meet the views of our best supporters—the smaller retail distributors."

London Quotations for Teas. When comparisons are instituted between Reuter's Tea quotations and those of Messrs. Gow, Wilson & Stanton, it must be borne in mind that the latter quote No. 1 "Pekoe Souchong ordinary leaf, fair liquor," the former No. 2. "rather bold leaf, indifferent liquor." It is certainly, as the *Times of Ceylon* observes, a pity that there should be two different quotations wired out, as they are apt to confuse.

"Markets are hardening." This is how a Canadian advertiser of Tea opens out, and he then asserts that "purchases are being made in New York and Chicago for re-shipment to England." Probably many customers will know no better; but if such purchases have been made at all, they must have been very little ones. The truth appears in our "Market Report," where interesting news from Canada will be found.

The Colombo Tea Sales. At the sale held at Colombo on the 19th instant, about 11,091 pkgs. = 886,624 lbs. were offered, of which about 7,817 pkgs. = 623,555 lbs. were sold. Prices were very irregular, and the tendency generally was downwards. Among the finest teas in the sale were, says the *Times of Ceylon*, Devonford, Mt. Everest, St. John's, and Ben Nevis. Among low-grown teas, good invoices were offered from Pallagodde, Glencourse, Kelani, and Eila.

"Cheesiness" in Tea. Recent remarks of Mr. Thos. Brown and the letter from "Interested," published on another page of this issue, lend support to Messrs. Geo. White & Co's assertion that "cheesiness" in tea does not result solely from the use of immatured wood for tea-boxes. There would seem to be no room for doubt that one cause is some defect in the manufacturing process. The matter is an important one, and deserves to be thoroughly investigated.

The London Tea Market. In their cable of 20th instant to Colombo. Messrs. Gow, Wilson and Stanton reported a fractional decline in prices of Tea generally, and a weak market for teas wet quality. Fair liquoring Ceylon Pekoe Souchong 8*d.* (¼*d.* down) average 8½*d.* (½*d.* down). Reuter reported : "Common kinds easier;" 21,000 packages sold out of 27,000 offered. Indian Tea averaged 10*d.* (¼*d.*) up, and of it also 21,000 packages were sold out of 27,000 offered.

South Sylhet Coffee. The local correspondent of the *Planter* writes :—The weather we have been having seems to suit this down to the ground, and as it swells its berries is producing strong and vigorous

wood for next year's crop. I am topping all my bushes as they come to about 2½ feet and making them develop their bottom primaries. The secondaries in a great many cases are pushing away three and four from a joint which are being handled out as they appear.

Given away, &c.

How is this for a bold advertisement? "Earn a bicycle by selling Blank's teas, &c. 150 lbs. for highest grade Bicycle (ladies' or gents'); 125 lbs. for second-grade Bicycle; 100 lbs. for Youths' or Maidens' Bicycle; 75 lbs for Boys' or Girls' Bicycle; 25 lbs. for Mackintosh or Silver Watch; 30 lbs. for Bookcase or Peek-a-Boo Camera. *Express prepaid. Write for particulars.*" It hails from America, of course.

Light Railways.

Messrs. Martin & Co., of Calcutta, Agents for Mr. Arthur Koppel, of Berlin, have favored us with an admirable book of illustrations showing the varied uses to which light railways and tramways are put. Views of a forest railway with animal traction in Sumatra, of rope haulage plant in South Africa; a railway in a coal mines district in India, another in brickworks in Germany; of a military railway in Russia; of platform wagons in a chocolate manufactory, and of electric railways elsewhere, show that these light railways can be adapted to many purposes.

Tea in Bengal.

The total number of tea gardens in Bengal during last year was 520, as against 483 in the previous year, the principal increase being in Jalpaiguri district. The total area under tea is 128,037 acres, an increase of 22,360 acres. Of this 102,204 acres are under mature, and 25,863 under immature plants. The total quantity of leaf manufactured is about 2,000,000 lbs. more than in the year preceding. The industry gives employment to about 127,000 persons, an addition of about 40,000 having been made to the labour force employed in the previous year.

Indian Labour in the Straits Settlements.

The British India S. N. Company has entered into an agreement with the Federated Malay States for the conveyance of assisted agricultural labourers from India. That Government contracts to buy from the company six thousand tickets per year at the reduced rate of eight rupees for a passage from Negapatam to Penang (the tickets being supplied to the agent of the Government at Negapatam), the company undertaking to maintain twenty-six sailings for the year. Supplementary tickets will be issued to certain coast ports from Penang at reduced fares.

Insect "Indicators."

A Wynaad correspondent writes to the *Madras Mail*:—"A notable feature in connection with the flowering of all three varieties of coffee, Liberian, Hybrids, and Arabica, this month, has been the extraordinary profusion of winged insects which swarmed upon the open blossoms, and consisting, in addition to several species of bees, of hawk-moths and butterflies, both of the common brown kind, as well as of the more brilliantly tinted types. This phenomenon was more marked than usual, and, according to well accepted doctrine, it may be taken as a hopeful indication for the current season's crop prospects."

Indian Corn and India Rubber.

"The Director of the 'National-Chamber of Commerce' in France has addressed the following note to the National Society of Agriculture: A new use for maize has just been discovered in America and gives considerable prospects to the grain-producers in that country. After extracting the oil from the maize, the process seems to consist in toughening it with an equal quantity of raw rubber; a substance would thus be obtained which for certain purposes would be equal to the best rubbers and far cheaper. As oil of maize does not oxidise easily, the rubber which is manufactured with this oil would remain supple and would not become cracked like the rubber which is made from other products."

Leguminous Manures.

Seeing that the subject of manuring with green leguminous plants is again cropping up, the *I. P. G.* would urge upon planters the raising of the Sensitive Plant *(Mimosa pudica)* and the common Balsam. Both of these grow wild in Assam, and those who demur to putting them down between the rows of tea on the plea that they would take too much out of the soil, might raise them on roadsides, the banks of ranks and other suitable places, where they could be reaped by the scythe and carried by pitchfork to be hoed in (when in full though unripened pod) to the places needing them. Early draining *bheel* land is admirably suited for growing these plants. But the fact must not be lost sight of that to prove of value the plants must be hoed in in as fresh a state as possible, or the nitrogen they contain will be lost in evaporation.

Tea Deliveries in the States.

A Washington despatch says:—"The withdrawals of tea from the Customs House have increased materially since it has become generally understood that the present duty is not likely to be modified for a long time to come. The general imports of February last were 6,606,516 lb., valued at $782,076, as compared with imports of 4,862,715 lb., valued at $656,928, in February of last year. The withdrawals for consumption during February last were 4,686,088 lb., valued at $632,897, and the duties collected were $468,608. The largest withdrawals for consumption were at New York and Chicago. The amount in the former city was 3,062,409 lb., and in the latter 1,100,659 lb. The next ranking port was San Francisco, where the withdrawals were 283,368 lb., and the next was the district of Minnesota, where a tea examiner was recently appointed, and where the withdrawals were 137,238 lb."

"Jyree Tea."

A planter writes as follows to his journalistic namesake in Calcutta: "The following is an extract from a book in my library:—'*Hop Tea.*—Is a species of tea prepared from common hops in Kent. It is manufactured much in the same way as Indian tea, and used chiefly to blend with the ordinary teas of commerce. It is claimed to be healthy and wholesome, from the fact that the *lupulin* of the hops counteracts or neutralises the excess of tannin contained in Indian teas. It, however, greatly enhances the price.' The hops of commerce consist of the strobili (female flowers or cones) of the *Humulus luputus*, but I believe the leaves of the hop plant contain the same virtues as the fruit. Can it be that

the Jyree leaves are simply hop leaves? As is well known a pillow stuffed with hops, or with hop leaves, is a 'popular means of procuring sleep,—a hop pillow' giving refreshing rest to the wakeful when every other sleep-producer has failed. I am inclined to think that the hop plant has something to do with the so-called *Jyree* tea."

The Cost of Labour in India.

Figures furnished by Consul-General P. F. Patterson appear to have caused some surprise in the United States. The Consul-General reports that the labourers of Bengal, Madras, and Bombay subsist on rice, wheat, barley, and other food-grains. Of rice they can buy eighteen to twenty pounds for a rupee (32 cents), fourteen to sixteen pounds of wheat, or twenty-three pounds of barley. Several of these food-grains are usually cooked together, and the quantity consumed by each person is about one and one-half pounds per day, costing an average of 2½ to 3 cents. With this food—rarely with meat of any kind—the labourers of India, especially the coolies, who do the hardest kind of manual labor, are remarkably healthy, with muscles well developed, and their endurance in carrying heavy loads long distances is something wonderful. It would hardly seem possible, says Consul-General P. F. Patterson, that the wages received ($1.80 to $7.50 per month) would enable the laborers to more than exist; but a majority of them, by their frugal living, not only support their families, but save money.

Hybrids.

The following remark concerning vegetables should be carefully noted by tea and coffee planters, for in the future these plants should repeat the history of hybrids in vegetables:—"Few people are aware of the fact that new varieties of vegetables of great merit are often produced and brought to perfection by a little careful selection of crosses between different varieties or species. Sometimes this work is very easy, and at other times it is quite difficult to fix the resulting product into a distinct variety." What *can* be done is shown in the fact that a very fine round podded bean has been produced from a female plant of the Jackson wonder dwarf lima and a male plant of the Yosemite Mammoth Wax. The first plant resulting from this cross in no way resembled either parent, being a strong growing vine with a large number of green pods, producing nearly 200 beans of a speckled grayish color. When these were planted no two of them produced beans that were alike. There were two that seemed to be very distinct; one of them was named Wonder Wax, and it is described as a wonder among wax beans. Pods are very round and of good size and excellent quality, being a nice yellow color. In season it is one of the very earliest, and it is very productive.

Lady-Birds.

Thus the Kumaon correspondent of the *Planter*:—It is now a matter of history what the Southern Indian planters did to import the lady-bird from Australia, and how after expending Rs. 3,000 (wasn't it?) the experiment totally failed. Last year I made some observations on lady-birds seen up here in Kumaon in my garden. This year I have been on the look-out for them and I find the place everywhere alive with them nearly. All fruit trees have two or three on them after a little looking, and the other day I undertook to pull up a strong plant of Artemesia and turned out ten from one plant. Now as there was some hundreds of Artemesias in the place, I fancy several thousand lady-birds must have been about at the time if the first example held good for the rest. The other day I went for a walk through some oak jungle and sat down after a time when two came down out of an oak tree and fell at my feet showing them to be pretty general. I have a notion lady-birds would travel through India from the Himalayas with perfect success in cases lightly-made covered with gauze and provided with a few living insect-infested plants or freshly-kept shoots for the journey; it seems to me the way they were attempted to be imported from Australia was too scientific by half for living insects.

Coffee in Sumatra.

A correspondent writes to the *Ceylon Observer*:—The long continuance of low prices is hitting hard osme few here who rushed into coffee when the prices were most inflated, trusting to be able to borrow later on. Alas! no money is to be found for coffee at present prices. Some of the most careful who went in before the period of inflation, made calculations which were prepared to stand a fall in price to $20 per picul, though they never really anticipated having to face the music set in such a minor key. These looked upon the affair as an investment, and are consequently rubbing along, though not yet making fortunes! A few, however, with small capital, went in purely and simply on the spree, and that of the wildest; and the corners of their mouths are considerably turned down just now. However, these prices cannot last for ever. One thing here is assured, and that is crops. Thanks to the soil, these come "whether or no," and the seasons do not affect Liberian to nearly the same extent that they do its more aristocratic brother. The original 20-year old trees have this year borne enormously. Five to six *catties* clean coffee per tree, which is equal to 6⅓ to eight lb., and one old giant is estimated to have yielded no less than *15* catties. Pro-di-gious!

LETTERS TO THE EDITOR.

"CHEESY TEAS."

Sir,—In your issue of 18th ultimo you published under the above heading a letter from Messrs. Brooke, Bond & Co., Ltd., in which they deal with this subject, and attribute the cause "to sappy, immature timber of unsuitable type "being used in the manufacture of tea chests on the Indian "and Ceylon plantations," and, certainly, if the result of their warehouse inspectors' work, for three weeks, is reliable, the number of defective chests is formidable. There are two remedies:—*First*, be more careful in selecting and drying the timber from which chests are made. *Second*, have all tea bulked by Messrs. Brooke, Bond & Co., Ltd!

There seems, however, to be a difference of opinion as to the cause of this "cheesiness," and as it is a matter of very considerable importance to planters, and those interested in the Tea industry, we would like to draw the attention of your readers to Messrs. Geo. White & Co.'s annual report on the Tea Trade for 1898, dated 23rd March last, which was specially dealt with by the *Madras Mail* of 14th April

1899. Reference is made to the manufacture of Tea and the Report says :—

"There were indications, however, at times that the firing in the "'driers' had been executed too quickly and at an excessive tem- "perature, thus destroying the flavour of the leaf operated upon, "and imparting an odour foreign to tea. To this some attribute "the so-called 'cheesiness,' which has given much trouble to "sellers and dissatisfaction to buyers more or less throughout the "season, particularly in the earlier months. That it was caused by "the use of unsuitable wood could *not* always be the case, as many "of the complaints have arisen with regard to parcels in *metal* "*packages*"!

This would seem to show that Messrs. Brooke, Bond & Co.'s experts are not just as up to date as they might be, and, if their opinion is solely acted upon, we fear this trouble of "cheesiness" will never be eradicated.

It looks as if a gross injustice had been done to the "wooden chests;" but, in any case, it is a matter which calls for the most serious attention of all Tea planters and those

"Interested."

21*st April*, 1899

GENERAL ARTICLES.

CEYLON TEA IN AMERICA.

The following is from a copy of a letter from Mr. Wm. Mackenzie, dated New York, March 20th, reporting generally on the state of the tea trade in America :—

Discrimination against China-Japan meets with no approval from the Home Government, who have to take a wide and general view of the Empire's affairs.

See the enclosed cutting. (Given below.)

It is astonishing how the dealers here are sticking out against the rise in the London tea market for lower grades

The importers had Calcutta and Colombo teas on hand—bought before the rise which began two months ago. These teas have been arriving during the last three weeks basing their prices on the recent rise, the importers have been loudly boasting that they would not sell under present London values. But one after another has been selling his teas one-half per cent. under London value to please the trade, and steal his neighbour's customers.

The trade has for years been getting China blacks (Congous) at 6d. and under, and last year got our P. Souchong at 3¾d to 5½d With another year of low prices, we would, I think, have entirely killed the China blacks. But the rise has driven importers to enquire for these again.

During my trip to the West. I had chiefly in view an enquiry into the success or otherwise of the demonstrations scheme I started last November-December *re* Pittsbury, Detroit, Buffalo and Boston. I have been getting weekly returns of those sales since we began demonstrating. I sent you some of those before leaving England. I was shown those of past four weeks all exhibiting a steady increase.

	Feb. 18th.	Feb. 25th.	Mar. 4th.	Mar. 11th.
Detroit ...	702 lb.	673 lb.	584 lb.	711 lb.
Buffalo ...	617 „	737 „	749 „	804 „
Pittsburg .	649 „	773 „	617 „	934 „
Boston* ...	460 „	1,210 „	1.440 „	1,685 „
	2,428 „	3,393 „	3,390 „	4,334 „

* A snow-storm stopped deliveries.

Those demonstrations were in connection with——'s tea. He had previous to last October been pushing his tea in those cities. some for twelve months, some for two years. He at first met with great encouragement, as the grocers took small quantities 5 to 20 lb. on the strength of his promise to advertise the tea This he did splendidly, and at a great expense, spending in Boston alone £20 to £30 a week in the best papers. His sales, however, gradually fell off—but perhaps because his advertising roused U. S. firms to make a push with similar teas. Grocers returned his teas instead of paying for them. He became disheartened and was gradually reducing his advertising. I was afraid he would retire from the States, in which case, his U.S. rivals would revert to their first loves, Chinas and Japans. I proposed substituting demonstrations for advertising and offered to contribute: so far the success has exceeded expectations and when I put it to his Managers in all four cities, "whether they would have advertising or continue the demonstrations," they with one accord answered "Let us have both, but if one must go, let it be the 'advertising.'"

One of the travellers selling the tea in Boston said, what I have often urged:—"I have been selling those teas since—— started in Boston. I failed miserably with the advertising. I have succeeded splendidly since the demonstrations were started *Every packet bought from advertisements, makes enemies, because of the way the tea is made.*

The demonstrators show the people how to make it—and make friends for us."

I have been interrupted by several callers. Mr. Blechynden has returned. It is not quite certain yet what the Indian Committee are to do. I shall not know till I see them in London, which I hope to do within a fortnight.

The last week for which I gave you the sales here (we are having demonstrations) ended March 11th. For week ending 18th, I have, so far, had the return from Boston only—it is the largest on our record, 1,740 lb.

About Chicago, and the West, I have much to say; but must postpone it. All goes well, however, so far as the packet business is concerned, but bulk teas are too dear in London for the market, as it is, low grades may take.

Greens.—In Mr Blechynden's report to his Committee he says about *unfermented teas:*—"Some samples of these Oolong teas made in India, were sent me early this year. They were found so suitable for the market, and firms were so ready to give immediate large orders, that I have had to revise my opinion. I now believe that there are certain districts in India, where Oolong teas of a character to command a ready sale can be made, and if such teas are produced *there is practically no limit to the business that could be done*," *&c.*

Those Indian greens I mentioned in my letter of 14th were packed up at once. Unfortunately there were only a few hundred cases, whereas thousands could be sold. These could be sold easily, whereas our blacks *for price* are unsaleable, being too dear.

An importer bought some Ceylon greens lately He has twice told me the people to whom he sold them, could not get rid of them—as they were good and pretty, but different from the kinds used here. These people have *now* wired to him to reserve for them any other similar Ceylon greens he could get.

Yours truly,

(Sd.) Wm. Mackenzie.

CANADA.

FRICTION OVER THE FAILURE OF THE HIGH COMMISSION—THE REFORM OF THE SENATE.

Montreal, March 12th.—I learn on good authority that there have been frequent inter-changes of communications between the Government at Ottawa and the office of the Canadian High Commissioner in London during the past fortnight, chiefly relating to the reports that have reached the British Colonial Office concerning the effect of the failure of the High Commission on Canadian sentiment. Notwithstanding that all the correspondents of London journals in Canada described the feeling over here as one of great and keen disappointment, an effort is now being made to create the impression that there is great rejoicing over the fact that the markets to the south are still closed to the luckless Canadian producer. It seems almost needless to say that this is very far from the truth, but it suits the politicians at Ottawa to have it believed. The exports of Canadian produce to England have fallen off by several millions of dollars during the past three months in spite of the efforts made by the Government and private enterprise to force sales. Coming at the same time with the closing of their hopes that the coming season would have seen a brisk trade across the border, the disappointment has been doubled, and, whatever may be said to the contrary, there is a feeling abroad that Canada's only remedy for the chronic unrest in which the country is kept is to assume entire freedom of action in her relations with other countries, more particularly with that to the south.

The evils of the present system are making themselves apparent in many ways. At the present moment there is friction between the provincial Legislature of British Columbia, the Dominian Government at Ottawa and the Colonial Office in London, arising out of the anti-Chinese and anti-Japanese legislation of the first named. The British

Government finds its policy with regard to China and Japan hampered by the exclusion policy of British Columbia, and is bringing pressure to bear on Ottawa to induce the latter to modify its alien legislation to suit the exigencies of England's Chinese and Japanese policy. But the British Columbia working-men, who curiously enough are largely emigrants from England, think more of their own interests than of high politics, and insist on being protected against Chinese and Japanese cheap labor. This places Ottawa in a dilemma, for if it coerces Victoria to please London it may drive the former into resistance and perhaps secession; while, if it fails to satisfy London, the value of Canada as an "ally" of England, as it is becoming the fashion to say, is just a trifle doubtful.

NOTES ON ECONOMIC PLANTS.

We extract the following from the report of the Royal Botanic Gardens, Ceylon, for 1898 :—

TEA.

The total export is once again larger than in any preceding year being 119,769,071 lb., against 116,054,567 lb. last year. Exchange has been very steady at about 1s. 4d., and prices have been low, but with a tendency to rise later in the year.

The extension of this cultivation has now practically ceased; but large areas planted during the last few years continue to come into bearing, so that for some time yet the total output will probably slowly increase. One of the most promising features of the past year has been the large increase in the export to countries other than the United Kingdom, America taking 2,180,188 lbs., against 830,873 lb. in 1897, and Russia 2,714,003 lbs., against 439,349 lbs., whilst the export to other countries has also increased very much. Australia now takes the large amount of 15,126,891 lb. The net result of this has been an actual decrease of the export to the United Kingdom by 2,796,226 lbs., which should help to improve the prices obtained.

The cultivation as a whole has been favoured by the absence of disease, but signs are not wanting that this immunity is gradually coming to an end, and that, like all other cultivated and wild plants, tea will have to contend with enemies both of insect and fungous nature, whose ravages will be rendered more easy and destructive than is the case with wild plants or the smaller crops by the great expanses of land which are covered with tea to the exclusion of other plants. During the past year unusual drought in the early months and a partial failure of the south-west monsoon have decreased the yield of tea considerably. A number of insect enemies have done damage . . . . . and the "gray blight" fungus of Assam, which is one of the most troublesome pests with which the Assam planters have to deal, has been more injurious than usual. It has been in the Island for many years, and is chiefly prevalent in the Yakdessa, Kotmale, and Pussellawa districts, though cases of its occurrence have been noticed in many others. The disease seems to spread more readily at low elevations. Though at present comparatively unimportant, this may become a very serious pest if planters are not upon their guard against its first appearance, and do not take care to eradicate it as far as possible when noticed. Other fungi have at times been noticed upon the tea, but none very commonly

A few small estates of tea, &c., have of late been allowed to go out of cultivation, and this raises a question of much importance to the planting community. Unlike coffee, tea when abandoned, does not die out, and consequently these estates form places in which both fungi and insects can, so to speak, develop a taste for tea which they may not have had before, and from which they may afterwards spread to the great detriment of cultivated tea elsewhere. Wherever practicable, abandoned tea, &c., should be destroyed.

The chemistry of tea cultivation and manufacture is now being made the subject of exhaustive study by Mr. M. Kelway Bamber, the expert engaged by the Planters' Association, and it is hoped that the methods of manufacture will be improved in consequence and become less haphazard than is at present the case.

COFFEE.

The export again fell largely, being only 13,313 cwt., as against 19,383 cwt. in 1897, and 86,009 cwt. in 1890. Native as well as plantation coffee has shared in this fall.

A number of varieties of Arabian coffee have been received from the Java Botanic Gardens, and are now growing at Peradeniya. Plants of the hybrid (Liberian-arabian) are also doing well, but of course it will be some considerable time before we can obtain any crop from them.

CAMPHOR.

There has been little application for this plant during the year, and considering the long period which must elapse before any return can be got, and the simple chemical constitution of this substance, this is hardly to be wondered at. It appears probable, however, that solid camphor can be obtained from the twigs and leaves, and, as the tree coppices well like cinnamon, this may prove a profitable method of cultivation, unless the present high price of the drug falls. Some prunings from the trees at Hakgala were sent to Mr. S. A. Owen, who obtained solid camphor from them by distillation at the rate of 15 lbs. to the ton —*Ceylon Observer*, April 7, 1898.

CACAO.

The export has again risen from 34,503 cwt. to 36,982 in spite of the ravages of the cacao canker which has been a troublesome pest during the year. The life-history of this fungus has been very thoroughly invesitigated during the year by Mr. J. B. Carruthers, the expert engaged by the Planters' Association. His observations and conclusions, with recommendations for treatment of the disease, have been published in pamphlet form by the Association. The treatment of the pest now rests with planters of cacao themselves, and there seems no reason to apprehend very serious danger to this cultivation if proper pains be taken to attack the disease promptly wherever it may appear. As was predicted, the planting of the hardier *Forastero* varieties is extending, and the old varieties are being steadily replaced by them.

CARDAMOMS.

The export of this product has slightly fallen, being 531,473 lbs., against 582,830 lbs. in 1897. The cultivation has been a very profitable one in some districts, and the area devoted to it is being rapidly extended in the northern districts of the Central Province. A caterpillar pest which has done some damage is described in Mr. Green's report.

Other Spices.—The total exports of Cinnamon continue to increase; that of chips has risen from 1,067,051 lbs. in 1897 to 1,414,165 lbs. in 1898. Vanilla continues to be planted in small quantities. Of nutmegs, cloves, pepper, betel-pepper, ginger, &c., all of which are on trial in the gardens, there is nothing of special interest to report here.

INDIA RUBBER.

A great deal of attention has been given to this product during the year. Mr. J. Parkin has spent the bulk of his time, since March 20th, in the laboratory here, carrying out chemical and physiological investigations into the processes of tapping and coagulations, &c. A tour was made in March to the Ratnapura and Kalutara districts to see the plantations of Pará rubber made by the Forest Department and on various estates. These trees are growing very well on the whole, and some have yielded very good rubber in promising quantity. The trees in the gardens have done well, and yielded a large quantity of seed, much of which was sold by auction at an average price of about R27 per 1,000. A large quantity of seed was also sold from private estates.

Early in the year a circular was published dealing with the cultivation, tapping, and probable yield of Pará rubber. The climate and soil necessary were pointed out, and the land really well suited to this tree in Ceylon was estimated at 10,000 acres, chiefly situated in the Ratnapura and Kalutara districts. In view of what is stated below, and of the fact that many persons are planting the tree at comparatively high levels or in otherwise unfavourable localities, I take this opportunity of calling renewed attention to the above estimate. Unless some much improved method of cultivation is discovered, or the price of rubber rises even higher than it now is, the chance of a profitable return in unfavourable localities is small. The tree itself grows as well in Ceylon as in its native home Brazil; but the yield of rubber is very much less, and is less even than that obtained from similar trees in Java and the Straits. It should, therefore, not be planted in any but the most favourable localities available.

The whole question of what tree to plant has, however, been reopened, when, so far as Ceylon was concerned, it might have been thought settled in favour of the *Hevea*. By the aid of machinery it is now possible to separate the pure or nearly pure caoutchouc from the latex or milk of any rubber-yielding tree, and the rubber so prepared has apparently the same quality, whatever tree it may have come from, and at the same time is very much purer than any natural rubber, even the best Pará. When rubber thus prepared comes upon the market in quantity, the probable result will be that for some time it will obtain higher prices than any ever

before obtained, but soon the price will fall to that now obtained for the best natural rubber, and the latter will fetch only a lower price. When the *Hevea* is tapped, as has hitherto been done in Ceylon, there is always a large proportion of the latex which dries on the tree, owing to its extremely syrupy nature. This yields a scrap rubber, which at present fetches a good price, and it was upon this price that the estimate of pecuniary return given in the circular was based. The price of this, however, as has just been pointed out, will almost certainly fall. The rubber milk that collects in the tins or shells used in the tapping can of course be treated by machinery, and will fetch a high price; but the average price will not be improved owing to the poor value of the scrap rubber, which cannot be thus dealt with, and may even be lower than the estimate given. The whole question therefore stands in need of revision.

Further than this, the use of the machinery equalizes the quality of the rubber derived from different trees, and now it is no longer important to choose the trees which gives the best natural rubber, but rather that tree which yields the most rubber. There can be little doubt that the tree which gives the best return in this way will, for most districts of south-west Ceylon, be found to be *Castilloa*.

In view of the importance of the conclusions thus briefly indicated, it is proposed to publish details in the course of the next few months. The machine methods of preparing rubber have been patented. Mr. Parkin has also elaborated methods of preparation which are simple and inexpensive, and yield very good results. It is unfortunate that there is so little *Castilloa* in the island that it is almost impossible to make a really fair test of the yield in different localities.

Both the new methods of treatment of milk above mentioned lend themselves well to the obtaining of rubber from young stems, and experiments are in progress to test whether the cutting of young plants, when eighteen months old or less, will give a good yield; if this prove to be the case, it will of course obviate the present necessity and risk of waiting ten years for a return on the capital invested. Those who have large quantities of seed might well try broadcast sowing, or close planting of seedlings, for cutting at a year or eighteen months old.

CINCHONA.

The export has risen to 975,784 lbs., against 653,346 lb. in 1897, and 1,309,560 lbs. in 1896. Prices have somewhat improved, and, though it would be perhaps unwise to recommend any extension of the cultivation, there seems some prospect of a return from those trees already in cultivation being obtained for some years to come.

THE INDIAN TEA ASSOCIATION.

At a meeting of the General Committee of the Indian Tea Association held on the 10th instant, letters of 24th February, 3rd, 10th and 17th March from the Secretary, Indian Tea Association, London, in connection with the American Market Fund, which had been previously circulated, were brought up for consideration and disposal. Under cover of his letter of 24th February, Mr. Tye had forwarded copy of a circular letter of that date to members of the Association in London covering a copy of the Interim Report of the American and Foreign Tea Committee, and asking whether they would be prepared to support a new levy to be raised for the purpose of opening out new markets for Indian tea. The General Committee had noted this circular, but it did not appear from the letter accompanying it to be quite clear whether the General Committee here would be justified in proceeding with a new levy until further instructions had been received from London. It was accordingly agreed to telegraph to Mr. Tye, asking him for the views of the Committee in London upon the question. The General Committee observed from the letter, dated 10th March, that the London Committee had decided to keep up, in conjunction with the Ceylon Committee, the joint advertisements of Indian and Ceylon tea in the United States until the end of the present season, but that Mr. Blechynden's special mission would be brought to a close at the end of April. The arrangements in connection with the forthcoming Exhibition at Paris, had again been the subject of considerable correspondence and the General Committee were now awaiting further detailed information as to the allotment of space, and the intentions of the London Committee generally with regard to the representation of Indian tea at this Exhibition.

Read telegram of 5th April from the Chairman of the Assam Branch of the Association, with reference to the proposed appointment of a Scientific Officer for the Tea Districts. Mr Buckingham suggested that a letter should be written to the Government of Bengal, asking for assistance towards the expenses of such an officer on behalf of the districts of Darjiling, the Duars and the Terai. This telegram had been despatched in connection with the Committee's letter No. 710 of 21st February, to the Chief Commissioner of Assam, and the reply thereto, dated 14th March, from the Officiating Secretary to the Chief Commissioner. In this letter the Committee had placed before the Chief Commissioner a statement of the advantages which would accrue to the industry by the appointment of a scientific expert, and had asked whether any assistance could be afforded from Government funds for the purpose of securing the services of such an officer. In his reply Mr. Cotton had stated that, while he realised the importance of the object in view to the tea industry and the Province generally, he regretted that he was unable to hold out any prospect of being able to contribute from Provincial Revenues towards the expenditure which would be involved. The Committee agreed to act upon Mr. Buckingham's suggestion, and address the Government of Bengal, asking for assistance and pressing the claims of the Tea Districts of Darjiling, the Duars and the Terai. It was to be stated in this letter that the General Committee were considering the means by which a scientific officer should be appointed to carry on investigations in those districts and also in Assam, and the Kangra Valley and H. H. the Lieutenant-Governor was to be asked whether, in the event of a scheme being worked out, the Committee might look to the Government of Bengal for assistance in defraying a portion of the expenses which would be incurred.

TEA, &c., COMPANIES.

The **Ceylon Tea Plantations Company's** profit for last year was £44,502. The usual 15 per cent. Dividend is paid, and £5,000 carried to Reserve. £5,000 is written-off for Depreciation, and £4,000 carried forward. The crop for 1898 was 7½ per cent. below the previous year's.

The **Imperial Tea Estates Company** pays 4 per cent.

The **Standard Tea Company** has earned £11,343, and pays the usual 15 per cent.

The **Alliance** has earned £5,209, and pays 7 per cent. for the year.

The **Sunnygama Company** has only been able to pay an interim Dividend on the Ordinary shares.

The **Gartmore Ceylon Tea Company, Ltd.**, declare a dividend on the ordinary shares for the year 1898 of 6 per cent.

The **Vellikellie Tea Company of Ceylon, Ld.**—The report states:—The result of the working is not very favourable, but as much so as could be anticipated from the weather conditions. The yield of the Estates has been 90,539 lb., of which 85,145 lb. have been shipped to London, and sold at a gross average of 10·08 per lb. The crop for 1899 is estimated at 210,000 lb. The Working Account discloses a surplus of receipts (£919 17s 11d) which, after the addition of the balance brought forward (£47 8s 6d) and the deduction of dividend on Preference Shares (£142 10s 0d), leaves sufficient for the payment of a Dividend of 2 per cent. free of income-tax, on Ordinary Shares (£705), and a balance to be carried forward of £119 16s 5d in respect of preliminary expenses, income-tax, etc.

The **Highland Tea Company of Ceylon** has declared a Dividend of 3 per cent., making 5 per cent. for the year.

Newara Eliya Tea Estates Co., Ld. has declared a Dividend of 3 per cent., making 6 per cent. for the year.

The **General Ceylon Tea Estates Co., Ld.** has issued a report, but declared no Dividend.

Rajnagar Tea Co., Ld.—Loss Rs. 14,781-10-2. Crop 4,441 maunds 39 seers; average price 5-1.72 per lb. against As. 5-11.87. Estimate for 1899, 5,000 maunds; expenditure Rs. 1,17,000. Area under tea, 803.25 acres.

Pashok Tea Co., Ld.—Outturn 2,142 maunds; average 10d. per lb; gross as in previous year. Dividend of 8% recommended. Esitmate 2,100 maunds at a total expenditure of Rs. 74,600.

Holta Tea Co., Ld.—Loss Rs.1,419-3-1; average As. 6-5.18, as against 7-9.26 for 1897.

Chalouni Tea Co., Ld.—Profit Rs.79,453-15-1. Interim dividends of 10% paid on 20th October and 29th December; final dividend at same rate now recommended, making 30% for the year, with

Rs.15,000 carried to Reserve. Crop 7,462 maunds, averaging 8d. against 7⅝d. in 1897. Estimate for 1899, 7,750 maunds at a gross outlay of Rs. 1,74,404, including about Rs. 12,000 for additions to building and machinery.

Punkabaree Tea Co., Ld.—Crop 1,130 maunds, 30 seers; average As. 4.80 per lb. against 5.35 in 1897. Loss Rs.9,106-2-3. Estimate 1,500 maunds at a cost of Rs. 30,500.

Burnside Tea Co. of Ceylon, Ld.—Crop 3,56,455 lb.; made tea, 116¼ maunds tea seed; 202 lb. cardamoms; average for tea 6¾d. Profit £395-4-1. Dividend of 2 % proposed.

Meenglas Tea Co., Ld.—Profit £5,096-18-10. Interim dividend 3%; £600 added to Reserve; final dividend of 5 %proposed. Crop 604,028 lb., averaging 7.59d as against 7.5d in 1897.

Ederapolla Tea Co of Ceylon, Ld.—Crop 447,026 lb. average 6¾d. Profit £2,068-4-4. Dividend of 5% recommended, and £300 for reserve, making this £1,000.

Kelani Valley Tea Association, Ld.—Crop 578,169 lb. averaging 6½d as in previous year. Profits £1,094-14-10. Dividend of 5% recommended.

Yatrypanlota Ceylon Tea Co, Ld.—C rop, 1,135,794 lbs., beside 8,628 lb made from purchased leaf, average 5.35d. per lb.; average cost f.o.c. 3.62d. per lb. Profit £7,665. Dividend @ 6% paid on preference shares; 4% paid on ordinary shares proposed.

Grob Tea Co., Ld., Assam.—Crop 4,134 maunds, averaging 7as. 3p. as against 8as. 6p. in the previous year. No dividend on preference shares. Estimate for 1899, 4,450 maunds at a cost of 6½ as. per lb. laid down in Calcutta.

Bandarapola Ceylon Co., Ld.—Crops 395,270 lb. tea, 195 cwts. cocoa; average of former 6,155d. against 6,008d. in previous year. Dividend of 5% proposed.

The **Nuwara Eliya Estates Company** pay 6 per cent. for last year on the Debentures. The profit was £8,000, against a profit estimated in the Company's prospectus of £31,000.

New Dimbula Company.—The following is from the *Investors' Guardian*, of March 25th:—

New Dimbula Company, Ld. (61,124).—Registered March 16th, with capital £100,000, in £1 shares to acquire the business of the New Dimbula Company, Ld. (incorporated in 1895), and to carry on in Ceylon and elsewhere the business of planters, growers and exporters of tea, coffee, cocoa, and cinchona. The subscribers are:

	Shares.

The numbers of directors is not to be less than three nor more than seven; the first are the directors of the old company; qualification £300; remuneration £500 per annual dividend. Registered office, 52 Gracechurch Street, E.C.

THE NILGIRI AGRI-HORTICULTURAL SOCIETY.

At a recent Meeting of the above Society, the following letter from Sir J. B. Lawes, Rothamsted, dated 27th February, 1899, to the Honorary Secretary, Nilgiri Agri-Horticultural Society, was read:—

"Dear Sir,—Your letter of the 6th has reached me, and I am forwarding you a copy of our cash memoranda sheet. I have only within the last day or two received a copy of our Publication of 1890 to the end of 1898, bound in one volume, altogether our Publications are comprised in seven octavo and three quarto volumes, and only a few days ago, Sir H. Gilbert and myself thought India was entitled to receive one or more copies. A great number have gone to the United States, and some to most of our Colonies. Copies have also been sent to various European libraries. I am afraid that the greater portion of our work is not suited to such a climate and such crops, as are grown in India. At the same time as we advance in knowledge, we find that the law of growth becomes more simple, for instance, although I cannot grow rice or sugarcane I feel quite certain that if I could have the climate suitable for these crops and could grow them in my wheat, barley or oat field—the manure would act in the same manner—or to put the matter in plain words, nitric acid is the chief food of all the graminacian plants throughout the world. You may possibly be interested in tea, coffee, or other crops, which are not annuals; with these nitrates of potash or soda, salts of ammonia, are, if anything, too active, and nitrogen is better supplied in form of bone-dust, cakes, or other organic substances rich in nitrogen. You will probably understand that the object of our investigations is to lay down the law of growth, rather than to apply it to practice; if, however, I can be of any service to you, it will give me much pleasure to answer any question.

Believe me, yours truly,
(Sd.) J. B. Lawes.

Read also letter from Mr. A. C. G. Nicholson, of Halacary, Coonoor, dated 25th March, 1899.

My dear Minchin.—Many thanks for sending me Sir J. B. Lawes' letter, but I have no question to ask, as we have been in direct communication with him, Gilbert and Voelcker through my cousin, H. B. Evans, and we are rapidly coming to the conclusion that, though artificials are an enormous advance on the old system of manuring, yet nitric acid is not the form of nitrogen suitable for the coffee-plant; but until we can secure the nodule bacteria suitable or peculiar to coffee, and a suitable medium for its culture, we are in *statu quo*. I do not agree with Sir J. B. Lawes in what he says about bone; if we had no leaf disease, he would be correct; but we must have a rapidly soluble manure to help the trees through their worst months, or the wood weakens. I am open to conviction, and I am trying a combination of bone, with soluble nitrates and phosphates this year; hitherto having been careful not to mix supers with bone, so as not to reduce the solubility of the supers.

Perhaps the judicious mixture may do better and it is certainly a little cheaper, which is a great consideration just now.

Your sincerely,
(Sd.) A. C. G. Nicholson.

Resolved that these letters be printed for the imformation of members, and the Honorary Secretary be requested to express to Sir J. B. Lawes the thanks of the Society for his interesting letter, and for the very valuable memoranda of experiments he has sent us, which are available for the use of members on application.

CEYLON TEA IN 1898.

A VALUABLE BROCHURE.

The *Times of Ceylon* says:—Of the making of books having Ceylon tea as their subject there is no end. Every week almost one such volume comes into our hands; but few of them have been a more concise, up-to-date, and interesting brochure than one which we have just received from Messrs. Tarrant, Henderson & Co. It is a quarto volume of 32 pp. enclosed in stiff red-bound covers, and supplies a full report on the position of Ceylon tea in 1898. It is a valuable manual, and, well illustrated, it is an attractive book of reference. The pictures comprise an agricultural and topographical map of Ceylon; photos of tea in its various stages, beginning with the tea bush itself with an explanation of the mystic terms—Flowery Pekoe, Orange Pekoe, Pekoe Souchong, and Congou; then there are types of cooly women plucking the leaf; men and women weighing in; rolling; fermenting; sifting; packing; and, finally, shipping; while this series is supplemented by another showing the extent of the mills wherein Messrs. Tarrant, Henderson & Co. carry on their business, pictures being given of their stores and barbecues; their packet-making and filling department; their carpenter's shop; their tea-tasting room, and their native staff; while to all the foregoing is added a reproduction of our local tea sale room. There are in all 27 plates in the work. The letterpress states concisely and with unimpeachable accuracy the position of Ceylon tea in the year under review (1898), and is full of statistics for the year. It is also instructive to the tyro in the tea-trade, the work comprising a glance at the origin and development of the tea trade; a brief history of Ceylon in its commercial aspect; and chapters on field-work on an estate, weeding, pruning, the tea plant, leaf plucking, tea manufacture, withering, rolling, rollbreaking fermentation, firing, sifting and sorting, and bulking. Then comes a description of the local sales; an essay on the quality of Ceylon teas; a list of local tea averages for 1898; the estimates for 1899 compared with those of 1898; a review of our shipments of tea, and

then a variety of most useful tables regarding freight, exchange, &c. The book is one that ought to be on every planter's desk, and certainly no one interested in Ceylon should go home without one, as it comprises, in a nutshell as it were, all the information that one is likely to be asked about respecting the island and its principal industry. The work, we believe, is the compilation of Mr. J. A. Henderson, on whom it reflects the highest credit.

LIFE IN THE WYNAAD.

On March 23rd, the *Times of Ceylon* published some notes from a Wynaad planter respecting the career of a number of Ceylon planters, who have migrated to that "land of promise," and it now gives from the same pen some further details of the life up there. We take the following extracts :—

IDEAL WEATHER.

Since the 28th ultimo we have been favoured with ideal weather in the Wynaad for all growing crops, as well as for young clearings of tea and coffee. Between the 6th and 25th of last month no rain fell, the skies were cloudless, and a certain amount of East wind was prevalent on three or four days in each week ; but the easterly gales were much less in evidence this Spring than is usual in the district during the first quarter of the year. On the evening of the 25th ultimo, thunder was audible far away to the East in the Mysore country, followed by a drizzle some miles inside the Wynaad boundary ; and, three days later, it was obvious that we were "in for the blossoming showers" to which so much importance is attached on all coffee plantations in S India. The following is a record of the rainfall since the 28th ultimo ; but this register is by no means the heaviest in the taluk, as, upon some properties, the aggregate rainfall approaches 8 inches :—

March	28th	... ·90	April	10th	... ·50
,,	29th	... 0·5	,,	11th	... ·90
April	1st	... ·40	,,	12th	... ·60
,,	2nd	... ·60	,,	13th	... 1·55
,,	7th	... ·15	,,	14th	... 0·5
				Total	... 5·70

COFFEE.

It is a well established fact in Wynaad that, as a general rule, Liberian coffee opens its blossom upon the sixth day from the occurrence of the first heavy shower in March ; Arabica following four days later, though the writer has known of Arabica coming into bloom upon the ninth day, and of "spike" upon the same variety bursting only upon the twelfth day after a heavy fall of rain. The variation in the blossoming periods between Liberian and Arabica is, therefore, believed to be the reason why the results of natural cross fertilisation between these varieties of coffee have been so rarely observed in South India. Following the seasonable weather already detailed, we have had a wonderful show of blossom all over the district both upon Liberian and Arabica coffee, and in this connection the following facts call for special allusion, as they constitute, so far as the writer is aware or been able to ascertain, a new "record" in such matters. The coffee estate on which the rainfall particularized in these notes was gauged is planted with Liberian trees, at about 10 feet apart, all through the Arabica ; the Liberian being now in its tenth year, while the Arabica ranges in age from 10 to 19 years. This property has been treated during the past decade with an exceptionally liberal quantity of both cattle manure and "artificials." The ·90 shower, which fell on the 28th of March, brought out a fine Liberian blossom on the 3rd instant, and started all the remaining "spike" on the trees ; the same storm resulted in the whole of Arabica coming into full blossom on the 7th idem ; while the shower of the 1st of the month forced the remaining Liberian bloom, amounting to fully half of the total, out on the same day as the Arabica. So that here was witnessed the unique spectacle of

BOTH SPECIES OF COFFEE IN FULL BLOOM,

simultaneously ! According to the opinion of Mr. John Cameron, the much-respected and popular Director of Parks and Gardens in the Mysore Province, the probabilities are very strongly in favour of the Liberian coffee on the plantation referred to having been "pollinated" by the Arabica, and, assuming this very unusual phenomenon to have actually occurred, the chances of the Liberian crop, which may be harvested on the estate a year hence, if utilised as seed, producing numerous original hybrid Liberian-Arabica plants are very encouraging, more especially as both Liberian and Arabica suffered from a very mild attack of *Hemileia vastatrix*, in the past season, and the myriads of winged insects—such as bees, butterflies and hawk-moths present during the blossoms was unprecedented. A certain proportion of the Liberian trees, upon which a comparatively small first, and a very heavy second blossom opened, have been specially marked, with a view to their crop receiving exceptional treatment. The importance attached to the cultivation and extension of hybrid coffee by Mr. Cameron and others competent to form a disinterested judgment on the question should be an apology for touching at such length on this topic, as I judge it to be a theme calculated to interest Ceylon planters, equally with those in South India! So far, nothing can be more satisfactory than the appearance of the coffee and the crop prospects in Wynaad; and the impetus given to young clearings, both of tea and coffee, is most marked everywhere, while old tea will continue to flush all over the country.

A LABOUR HINT.

Another local rumour credits a well-known Ceylon planter, who is already largely interested in Wynaad territory, with the intention of "annexing" a further tract for tea. Wynaad residents and landed-proprietors are prepared to welcome as many immigrants from your island as may elect to settle in the taluk, where the "Pioneers" have already succeeded in making themselves popular, but the one point on which we are to a certain extent uneasy is as to the possibility of these friends organising a combination to enhance the local scale of daily wages, with the idea that, by offering a higher rate of pay to the classes of labour hitherto employed in Wynaad, the labour market will be more largely supplied. If such an opinion is held amongst Ceylon men, they would be well-advised to modify it, as any attempt to enhance coolies' wages would prove a most fatuous policy, while it would undoubtedly add to the outlay on the cultivation of tea gardens where the cost is already higher than in Ceylon, and this without attracting more of such labour.

MR. G. L. ACWORTH AT COLOMBO.

The *Times of Ceylon* of 19th instant announces the arrival of Mr. G. L. Acworth by the SS. "*Rome*" on the 16th instant and his departure for Travancore on the 19th. Our contemporary says :—He is uncertain as to the length of his stay in Southern India, but it will be as short a time as possible. The main object of his return to the East is to pay a visit of inspection to his properties.

In the course of a talk with a representative of the *Times of Ceylon*, who enquired

THE PROBABLE RESULT OF THE CURRENCY COMMISSION,

Mr. Acworth remarked that it was absolutely impossible to say definitely what the outcome would be, or its effects, but the general opinion was that the standard of fifteen rupees to the sovereign would be fixed. There was, he said, a tremendous amount of evidence given at the enquiry, but the bulk of it was of an official character. The enquiry opened in May last, continued throughout the sitting of Parliament, and began again in November, finally concluding in March of this year. He anticipates that the report of the Commissioners will be issued about June.

"It is certainly possible," observed Mr. Acworth, "that the Government of India will succeed in their endeavour to popularise the use of gold. A rather curious fact was told me the other day by one of the Madras Members of Council, who stated that three sovereigns had been tendered in payment of taxes at one of the local Treasuries. This was probably the first instance, since the closing of the mints, in which gold had been willingly tendered in payment of taxes. It is, I consider,

A MOST INTERESTING AND SIGNIFICANT FACT.

The Indian Government had been endeavouring to bring this about ever since they closed the Mints."

Turning to the question of the tea prospects, Mr. Acworth said he anticipated

A FAIRLY GOOD TIME FOR TEA

during the next six months. "There is," he remarked, "a certain scarcity of tea now, but I dare say there will be a big drop in the autumn."

Mr. Acworth incidentally mentioned that he met a China Tea merchant the other day, and learnt that there would be large shipments of tea from China this year –larger than had been the case for many years past.

"That is our difficulty," said Mr. Acworth. "whenever we fall short, China can very rapidly make up the deficiency. It will be a very great pity, however, if this leads to a great deal of coarse plucking."

"One point in our favour is

THE ENORMOUS RISE IN COPPER.

The whole of the wages in China are paid in copper. We may grumble very much at being handicapped as regards the rate of exchange, but, as a matter of fact, things are equalized by the fact that all wages in China are paid in copper, which, as I have already said, is now at an enormous premium."

"It is also interesting to know," Mr. Acworth observed, "that the merchant I was talking to was one who took a great interest in the Foochow Tea Improvement Company, which he told me had been a dead failure. Machinery was got out and they set to work in the only district which they could get at. The latter was old and worn-out, and the leaves turned out so hard and tough that in rolling they broke. The merchant, to whom I was speaking, however, said he believed success would be met with if the machinery was transferred to the new districts where some of the really good teas were."

"As China has been greatly opened up," remarked Mr. Acworth, "it is quite possible that machinery may soon be erected in the more paying districts."

Mr. Acworth, who has, with Mrs. Acworth, been staying at the Galle Face Hotel, was unable to impart much information with regard to his own estates, as he is himself going to gather particulars.

TEA MANUFACTURE.

Withering.

The *I. P. G.* contains a paper from which we take the following excerpts:—A good wither is a *sine quâ non*. It is indispensably necessary to the preparation of first-class tea. The process has for its object the extraction of part of the moisture contained in the leaf, so that it may be rendered soft and pliable for the subsequent process of rolling.

In treating of the more salient points (the general principles being well known), it is assumed that the leaf has been brought into the tea-house in a proper state as to age, etc., for if *bad* leaf (*i.e.*, over-ripe, tough. leathery leaf, etc.) is brought in from the field, no subsequent operation will ever convert it into good tea.

In seasons or drought great attention requires to be paid to the withering process, for at such times there is much less sap in the leaf, and less moisture to evaporate than is the case during or immediately after rain. Consequently, if the leaf is over-withered the juice becomes so thick by the time it is ready for oxidation, that it will not oxidize properly, no matter what the condition of the atmosphere may be.

Leaf commences to decay, sooner or later, after it has been plucked, the decay being dependent upon the state of the weather and the condition of moisture in the leaf. To make tea of really good quality, strength and flavour (all the conditions being similar) leaf should be manufactured assoon as possible after being plucked.

Natural withering, by means of a free supply of light and of cool air (*i.e.*, air at the normal temperature of the surrounding atmosphere), is by far and away the best A cold wither, in a cool, dry atmosphere, produces the best results. The great desideratum is abundance of *space*, for spreading out the leaf thinly and evenly, so that nature's gentle, cool, perfectly dry draught of air may play over it. Excepting in fine, bright, dry weather, however, it is next to impossible to wither leaf by natural means. The process would take so long in wet or damp, cold weather, especially during the rainy season, owing to the humidity of the atmosphere, that even if ample space was available, some more expeditious method than is attainable by natural means has to be adopted.

Artificial withering has, therefore, to be resorted to, the agent employed being *heat*, but the least heat employed the better. When a damp atmosphere or low temperature prevails, the air saturated with moisture cannot take up that evaporated from the leaf unless raised (expanded) or dried by heat. Heat has to be utilized when there is danger of a block in the work from leaf accumulating faster than it can be manufactured, or, when from the too great time occupied in withering, there is the danger of the leaf getting tainted and acquiring an obnoxious smell. The application of artificial heat, however, is not conducive to high-class quality. Only so much as is absolutely necessary should be employed, and then only as a last resource, when withering cannot be affected by natural means.

When excessive heat, or when the moist heat is applied, it scorches, or it bakes, stews, or otherwise damages or deteriorates the leaf, rather than withers it Wet leaf placed in too great heat bakes and damp heat volatilizes the essential oils in the leaf. These are all most important points to remember. Too great heat, moreover, dries the edges of the leaves and in other ways renders the leaf unfit for the subsequent process of rolling.

The heat (more correctly designated warmth) should be of such a character that the temperature, while absorbing moisture, should, without any approach to scorching, steaming or baking, render the leaf soft and flaccid for rolling, and for generating that oxidation, which should ensue on the bruising of the leaf cells *in* (not before) the rolling. The heat should be under perfect control, regulated and accurately employed. What is really required is heat in motion, and an exposure of the leaf, by a constant but gentle motion, to an equal temperature over all its parts, the warm air percolating, thoroughly and equally, through the whole of the leaf. Gross and coarse as leaf is in forcing weather when the atmosphere is charged with vapour, better teas would be made if we could only wither it off sharp, without steaming or baking it in moist heat before rolling.

Moist heat is undoubtedly prejudicial to obtaining a good wither. At the same time it must be remembered that the leaf on the bushes is far from the same at all seasons of the year (as has already been stated), so that the leaf brought in to the factory from the field varies very considerably at different times. The flush obtained during the months when damp, hot weather prevails is of forced growth, rank, and the teas made from it, though manufactured under the most favourable circumstances, will have a certain *coarse* flavour. No manipulation will entirely eradicate this (with our present appliances), but careful treatment in the process of withering, although it may not secure first-class tea, will certainly ensure better tea than would otherwise be obtained.

The best and most flavoury teas are made when the weather is cool. because then the flush is not of quick, forced growth. Another favourable season, at the commencement of manufacture, is when the weather, in addition to being cool, is dull and cloudy, with a fair amount of rain. Teas made at the latter end of the season, when the cold weather has set in, are also generally very flavoury. Teas are invariably flavoury when the weather is cool, with a fair amount of rain. Teas are wanting in flavour when the weather is warm and rainfall is short. Teas manufactured from leaf taken off bushes which have been heavily pruned and have consequently yielded a succulent flush, are not flavoury, and, as a general rule, are always wanting in strength. From the time withering is started the operation must be continuous. There should be no check in the process from currents of cooler air than that which is being employed. An even temperature is essential.

Perfect withering (when heat is employed) consists in removing all superfluous water from the leaf as speedily as possible (the faster the process the better), without disturbing the oils, juice, etc., while just sufficient heat (warmth) is applied to reduce the fibre of the leaf to the soft condition required for rolling. It is best accomplished by a strong draught of moderately warm and quite dry air, desiccated by either decomposition or absorption, or both, passing over the whole surface of the leaf. As long as the juices are kept uninjured, the more the leaf is withered the better the quality of the tea. The presence of too much water in the rolled leaf affects the subsequent process of oxidation injuriously. Leaf is properly withered, if, when held tight in the hand, it does not crackle and keep the shape into which it has been pressed. Properly withered leaf is best told by touch, which experience gives after a time. Leaf to give a good "make," *i.e.*, twist and colour of infusion—a new-penny, bright-copper outturn—must be properly well withered, soft to the touch, not dry or crisp. Leaf well and properly withered should, when ready for rolling, have much the feeling of a fresh kid glove when compressed in the hand.

MANURING TEA.

The *Ceylon Observer* publishes the following statistics of practical experiments conducted by Mr. Joseph Fraser, and their results, calling attention to the facts that, all the experiments, save one, shewed a profitable return even on the first year's crop; but that a second year's crop must be realized before a fair conclusion can be arrived at as to the most economical and most durable as well as profitable application.

Manure Experiments from 18th Feb. 1898, to 13th Feb. 1899.

No. of Fields.	1	2	3	4	5	6	7	8	9	10	
Particulars of Manure applied per acre.	No Manure.	400 Blood meal. 200 Basic slag.	200 Basic slag. 150 Sul. of potash.	400 Blood meal. 150 Sul. of potash.	250 Basic slag. 400 Blood meal. 150 Sul. of potash.	200 Blood meal. 250 Basic slag. 200 Sul. of potash.	400 W Castor Cake. 400 Fish. 100 Sul. of Ammo. 100 Nitrate of Potash.	800 Castor Cake. 200 Basic slag.	800 Castor Cake. 200 Bone meal.	1,120 Extra Dissolved Guano.	
Tea secured per acre ...	706·752	888·608	855·243	954·738	1,054·774	1,079·449	1,023·006	1,090·505	961·516	1,206·105	
Increased yield over unmanured plant ...		182	148	248	348	373	316	384	255	499	
Cost of plucking and manufacture to f.o.b. 12¾ cts. ...		23·20	18·87	31·62	44·37	47·56	40·29	48·96	32·51	63·62	351·00
Cost of manure and application ...		39·19	27·24	45·55	53·91	45·81	53·75	42·44	42·92	98·50	449·31
Total cost of increased yield ...		62·39	46·11	77·17	98·28	93·37	94·04	91·40	75·43	162·12	800·31
Amount realized fo increased yield 33·76		61·45	49·97	83·74	117·51	125·95	106·70	129·66	86·10	168·49	929·57
Profit per acre over the unmanured area		·94	3·86	6·57	19·23	32·58	12·66	38·26	10·67	6·37	129·26
Lbs per acre of essential ingredients in the manure applied.	Nitrogen.	44·80	Nil.	44·80	44·80	22·40	79·60	50	56	134·40	
	Potash.	Nil.	75	75	75	100	48	10	10	22·10	
	Phos. Acid.	34	34	Nil.	42·50	42·50	27·16	52	66	56	

Mr. Fraser remarked :—"With the exception of field No. 2, they have all paid for the manure and most show an excellent profit besides. The results in yield next year will show more accurately which will give the best paying results per acre for a two yearly application—what is the best *now* may not by any means show the best results at the end of the two years.

"The suppression of one essential ingredient in 2, 3 and 4 shows clearly their relative importance. Nitrogen being the dominant element, Potash the next and Phosphoric acid the last, which agrees with my previous experiments.

"The Basic Slag through its free lime helped in several instances apparently to bring the nitrefying organisms into play and helped to render the inert nitrogen available for plants. Next year's results will further test this point. So far as appearance of the bushes is concerned, they look best in the following order: 5, 7 (castor cake, fish, sulphate of ammonia and nitrate of potash) 10 and 6, 9 show most fungoid-affected leaves and a falling-off in the vigor and succulence of the flushes and 8 shows a falling-off to a more limited extent. This may be owing to the lack of available nitrogen during the dry weather."

On 21st inst. Mr. Joseph Fraser sent Messrs. Freudenberg & Co. the analysis of a fair sample of the average soil of the experimental plots as follows:—

The results represented the composition of the fine earth of the soil, *viz.*, that portion which passes through a sieve having 40 meshes to the linear inch.

	Per cent.
Water lost at 212° Fahr.	55·50
*Organic and volatile matters ...	11·900
Soluble in standard hydrochloric acid oxides of iron	11·720
Alumina and Manganese oxide	16·127
Lime...	·461
Magnesia	·690
Potash	·245
Phosphoric Acid	·153
Insoluble silicates and undetermined matters...	53 154
Total ...	100·000
*Containing Nitrogen	·135

The soil is well supplied with lime, potash, phosphoric acid and magnesia. There is a fair amount of nitrogen, but this is relatively the most deficient element of plant food present; and from the analysis we would expect this soil to be more responsive to the nitrogenous elements in manures than to the potash and phosphoric acid. The air-dried soil contains a high percentage of water, *viz.*, 5·55 per cent, or in a drier condition of the atmosphere 4·20 per cent. The high percentage of alumina accounts for the soil being thus retentive of moisture.

(Signed) M. COCHRAN, F.C.S.,
City Analyst.

STRANGE TEAS AND THEIR "CHARACTERISTICS."

"I have before me," writes a gentleman interested in tea, "two handbooks for the tea trade, one written by an Englishman, the other by an American. Both treat on the subject of "Tea Blending" as an art.—"I give one or two extracts :—

"Darjeelings from Terai (Terai is below Darjiling) are probably the best teas that are brought to England; for full flavour and rich strength they are unequalled." This is, indeed, news to Terai planters, and if they do not "buck up" and send these teas to the home market this season they will have no one but themselves to blame. The handbook has certainly spoken its best for the Terai and its teas. Such a high opinion is not held of any of the other tea districts. Dehara Dun teas are thought little of. They are said by the Englishman to be "high burnt and rather sour. Occasionally the flavour is rather earthy. They are not very much sought after." The American is of the same opinion. They are, he says, "high fired, loosely made; deteriorate rapidly, and become sour or rancid on exposure to the atmosphere in a very short time. The liquor is frequently *earthy* in taste." The infused leaf of Chota Nagpur teas, it is stated, are "very bright, the liquors are fresh and flavoury, but also weak and sickly." Chitagongs are pronounced as "thick, heavy and strong in the cup and *nutty* in flavour. They are good useful teas for blending purposes from their great strength and positive character." The following paragraph is beyond my comprehension: I leave it to some South Indian

planter to champion his own cause. "Neilgherry (Madras).—The Neilgherry Hills produce fancy green teas. The black teas from these hills are, perhaps, the most inferior of all Indian teas. When Neilgherry teas were first imported, the flavour was decidedly objectionable. It has now slightly improved, but is still far from perfection. The liquor is thin, and the dry leaf black and tippy. These Neilgherry teas from Madras must not be confused with the Assam Neilgherry teas, which are strong, rough, and pungent." Where, Mr. Editor, are the Assam Neilgherries? Where also is Rangurth? It is said of the teas from this district (?),—"the infused leaf is bright, the liquor is fine and fresh, but thin and inclined to be sickly." Will some Rangurth planter inform me where he is? —*Planter.*

COFFEE EXPERIMENTS IN CALCUTTA.

Indian Gardening publishes the following letter:—Dear Sir,—I send you six twigs, marked A.B.C.D.E.F., taken from coffee bushes in the Society's Gardens, showing results of manurial experiments commenced last November.

A. is a branch of *Coffea arabica* 30 inches long, bearing 2 axillary clusters, averaging two flowers to each cluster, and 8 leaves. Unmanured.

B. is a branch of *C. arabica* 16 inches long, bearing 24 clusters, having an average of 4 flowers to each cluster, and 18 leaves. This bush was given two table-spoonsful of *Ichthemic* only.

C. is a stem of *C. arabica* 24 inches long, 36 clusters, each averaging 4 flowers and 12 leaves Treated with double the above quantity of *bone meal.*

D. is a branch of *C. arabica*, and has 37 clusters of flowers, and is 36 inches long, with 21 leaves. Three spoonsful of *bone meal*, and 3 of *Ichthemic* were given to this.

E. is a twig of *C. liberica*, unmanured, 14 inches long, 1 cluster with two, and the other with one flower, and 5 leaves.

F. is a twig of *C. liberica* treated with the same quantities as D., 14 inches long, 16 clusters of flowers, on an average 3 flowers to a cluster.

Coffea liberica was heavily pruned, while *C. arabica* remained uncut.

So far the above experiments show that *Ichthemic* used alone produces greater leaf growth and abundance of flowers. *Bone meal* less leaves and larger flowers; while a mixture of the two results in scantier growth of leaves and more abundant production of flowers.

It yet remains to be seen what the yield in berries will be; from all appearance each flower on the bushes appears to be "setting" fruit. By an unfortunate mistake the bushes of *C. liberica* were heavily pruned, but in comparison to *C. arabica* they produced nothing like the quantity of fruit. The bushes are about 12 years old, and are planted under the shade of mango and other trees.

Though the experiments were commenced but five months ago, there has already been a distinct improvement in the bushes as regards production of flowers. The experiments will be continued, but it would be interesting to learn that others had taken up similar experiments in Calcutta and Assam.

At present all bushes of *C. arabica* and *C. bengalensis* are loaded with flowers, the former giving off a delicious perfume and forming a most charming picture with their pure white flowers in shady glades.

Yours faithfully,
P. Lancaster.
Secretary, Agri-Horticultural Society of India.

Metcalfe Hall,
Calcutta, 17th April 1899.

[Note.—We are much obliged to Mr. Lancaster for the specimens sent. B. C. and D. appear to us to be particularly robust and healthy specimens, and show what benefits they have derived from manuring, compared with A. Bone-meal is a very valuable fertilizer for Coffee, and being cheap and easily procurable, it ought, we consider, to be largely used on coffee estates. "Ichthemic Guano" is also a valuable fertilizer, but being very expensive (compared with bone-meal), it will not be within reach of the planter. The specimens of *Coffea liberica* do not show to advantage; but that may be due, as Mr. Lancaster explains, to the bushes having been severely pruned. We shall watch with interest the setting of the berries.—Ed., *I. G.*]

BRAZILIAN DEPRECIATION.

Last week I gave some general information about the economic and financial position of Brazil, shewing that although the country has unlimited possibilities for the production of wealth, it has for the past ten years been paying its debts by raising fresh loans and issuing paper money as fast as it can be struck off the plates. This is a deplorable condition of affairs; yet in the circumstances, and considering the inexperience of the country's rulers, it was probably unavoidable. Under the Empire, Brazil had always paved its way and it held the unique position of being the only South American state which had religiously honoured its obligations.

When the Republic was constituted it had to live up to this tradition; if it had failed to do so it would most likely have succumbed at the outset. But it had also to face difficulties undreamt of under Don Pedro. The first President had not settled down in his chair before half a dozen claimants were in the field, jealous of his advancement and power, eager to hold the reins themselves, and ready to test the feeling of the country not only by the ballot-box but also in the battlefield. Accordingly, for some years, Brazil was in a perpetual state of revolution and anarchy, and those nominally in power had to find money for the campaign by fair means or by foul. It was only to be expected therefore that they would draw on European investors as long as they were permitted to do so, and would then resort to more questionable methods of raising the wind.

Since then each Government for the time being has floundered frmo one mistake into a worse, with the result that now the country can only by a miracle escape complete default and utter discredit. If its Parliament and Executive had had any training in the theory and practice of good government they might have been able to escape some of the alluring pitfalls temptingly spread before them; as it is, they seem to have blundered into every one and created others which the student of political economy could scarcely have dreamt of. I have spoken of fresh borrowing to pay debts and the abuse of the printing press, the latter being perhaps the most dangerous from the financial heresy to which a country could resort. But in other ways the Government has gone hopelessly astray, and it seems to have pretty well exhausted all the obvious methods of running the show in the worst conceivable manner.

To prove this it is only necessary to allude to a few patent facts. For years past Brazil's expenditure has been far in excess of its revenue. It would have been a very simple matter to reduce expenditure, and it would have been still easier to increase the revenue without adding to the burdens of the people. As I have said before, 25 per cent of the expenditure could be saved without reducing the efficiency of the administration by as much as a brass button if some check were imposed on the notorious leakages which are now winked at. On the other hand, the taxes, direct and indirect, imposed by the Goverment, would yield 100 per cent. more if honestly and properly collected. At least, that is what Brazilians, who "know the ropes," tell me. But instead of devoting their attention to these points, the Legislature has gone on increasing import duties and the like till commerce is absolutely overwhelmed with the burden, and instead of supplying the wants of many, it can now only pander to the luxuries of the few.

The result is that trade is steadily declining, and instead of the imports yielding more revenue from the higher duties imposed, they produce less every year The latest change in this respect is the law passed recently requiring 30 per cent. of the customs to be paid in gold. The result is that duties, which were already far too high, have been increased from 30 to 50 per cent.; yet Congress passed the measure without apparently paying the slightest attention to its probable effects. The trading community and the independent press have united in denouncing this imposition, but they are powerless unless they foment another revolution, and that will not help matters. And besides, the fact that the customs duties are ridiculously high, the regulations seem to have been drafted with a view to creating the greatest amount of friction and annoyance possible—possibly to give the customs officials as many opportunities as possible of levying blackmail on importers and foreign agents. Under the circumstances it is surprising that the country has managed to retain any foregin trade at all, and the fact that it has, bears eloquent testimony to the possiblities of the country if it were properly governed.

Now let us examine the effect of this policy on the country's securities. We have no means of ascertaining the present value

of the Internal loans, but assuming that they have depreciated to the same extent as the paper currency, they would now be worth only one-fourth of their face value. As regards the External loans, we have the Stock Exchange quotations to guide us, and the following table shows to what extent the various issues have fallen. I may remark that they have recently been very much lower than the prices marked, and but for a lingering faith (quite unfounded, alas) that the great house of Rothschilds would safeguard the bondholder's interests, the quotations would doubtless have fallen 50 to 100 per cent. further:—

Loan.		Present Amount.	Price.	Dep'tion.
1879	4½ p.c.	£2,276,387	63	£842,268
1883	4½ p.c.	3,292,000	64	1,185,120
1888	4½ p.c.	5,298,600	63	1,960,482
1889	4 p.c.	18,388,200	62	6,987,516
1895	5 p.c.	7,331,600	70	2,199,480
W. of Mins	5 p.c.	3,388,100	64	1,219,716
Funding	5 p.c.	1,926,466	89	211,910
	Total	£41,901,353		£14,606,492
Provincial, etc, Loans—				
San Paulo		£688,500	92	£55,080
Rio de Janeiro		503,000	67	165,990
Parana		197,400	32½	133,245
Santos		86,700	99	867
	Total	£1,475,600		£355,182

From the above it will be seen that the National Loans, amounting at present to about 42 millions, are depreciated to the extent of 35 per cent., while the State and City loans have lost 24 per cent.. In addition there are £1,500,000 Treasury Bills outstanding, but apparently they are all in the hands of the Rothschilds, and at any rate no quotation for them is ascertainable. I notice, however, in a recent issue of the *Jornal do Commercio* of Rio de Janeiro, that it is intended to pay off these Treasury Bills at once, and in any case Messrs. Rothschild stipulated that they should be a first charge on any funds received from the sale or lease of the Brazilian Central Railway which has hung fire for the past 18 months or more. —*Weekly Sun.*

THE COMING TEA BOOM.

"J" writes in *Capital*:—That hope springs eternal in the human breast was never better exemplified than in the tone just now of all the papers connected with the tea industry. If any of our readers will just trouble to turn up the papers at this time last year, and read the gloomy forecasts for the season, and, later on, the suggestions thrown out for auxiliaries to tea, as the industry was on its last legs, and still later on (till within a month or two ago) the pathetic reference to the great army of unemployed tea planters, who were knocking about Calcutta without the wherewithal to buy a meal; one can scarcely believe their own eyes that such a brief period could have transmogrified the situation as now represented in our planting papers: in fact, the change of front reminds one of the "Rejuvenation of Miss Semaphore"—a modern miracle! What can be the meaning? Is it a bait laid out to catch the unwary investor?—a sort of walk-into-my-parlor sort of business, for we fail to find anything to account for the buoyancy which is at present on. We do not deny that the figures of consumption, etc., are much more encouraging than they have been for some time, but provided all the districts make good crops this year (which they are all pointing to just now) the outturn for shipment to London will be at least two millions more than last year, which is quite enough to have its corresponding effect on the market price of tea at home. The stock of tea at present in London, notwithstanding the depletion which has taken place for some months, is more than equal to a six months' requirement, so that there is always a large surplus to fill any immediate want; and, until this surplus is depleted to almost zero, it is utter nonsense papers writing of a probable dearth of Indian tea. Such a course as we are referring to can have but one end, and that is disaster; poor, worthless stocks will be boomed, and gardens opened out, and the public taken in; last year showed what a panic the production of a few million extra pounds caused on the stock exchange; even properties, which were well known as sound investments, sharing to such an extent in it that they could with difficulty raise their finance, and, then only, at ruinous rates. Any one going to a bank, and asking for accommodation, and offering tea shares, had a reply, "Faugh, a drug in the market; our instructions from home are not to touch tea." What a change a few months has wrought over the scene Your bank manager meets you with a smiling countenance: "Certainly, certainly, hypothecate the crop, and we will make advances;" in fact, we hear of one or two cases in which money is being advanced to open out new concerns. *Cui bono?* Echo answers, for whom?

We by no means look upon tea as a bad investment, but there have been so many "booms" in it since its infancy that we would advise a little more sobriety now that it has got to maturer years, and those who walk in this way will reap the benefit. One of the greatest curses the industry has had to contend against has been the promoter—the modern Hooley, and we see signs of several such being on the warpath already, and we simply utter a word of warning in time as we feel confident the Calcutta agency houses if combining together could stop such a thing. It must be always remembered that tea has a great deal to contend against, and should give a 10 per cent. dividend, when many other investments are giving 5. Consider what a cholera scare, a shower of hail, a bad breakdown in the machinery (not to mention many other things) mean in a large concern. A season's prospects may be ruined in an incredibly short time, and we think that every one will agree that 10 per cent. is not too much to expect from tea. Let our readers examine the share list for 1898, and finding a 10 per cent., or even an 8 per cent. dividend against that company, they may then consider these a safe investment, but nothing under that.

THE BRAZILIAN COFFEE MARKET.

The following is the detailed weekly report on the Brazilian coffee markets from the *Rio News* of March 14. On Monday the Rio market opened firm with business done freely between packers and factors on bases of 12$700 and 12$800 per arroba for No. 7 type. There was also a good demand on the part of the exporters, but their ideas were based so low, owing to the state of exchange, that the packers refused to consider their offers and were firm on 12$700 per arroba No. 7, at which 12,000 bags were disposed of in the course of the day. In Santos the market was firm, with good average selling at 7$900 per 10 kilos. The news from New York and Hamburg reported slight falls, while insignificant rises took place in Havre and London. The local market was not quite so firm on Tuesday, but between factors and packers a fair amount of business was done on bases which ranged from 12$600 to 12$800 per arroba for No. 7. The shippers held out for a reduction of price, but notwithstanding that they could buy from 100 to 200 reis less than on the previous day, the known sales at the end of the day did not exceed 10,000 bags. In Santos prices were also less than on Monday, good average fetching 7$800 per 10 kilos. All the foreign markets reported small falls. On Wednesday the Rio market was very dull, with only a few lots offered for sale. The business between packers and factors was arranged on bases of 12$400 and 12$500. The American shippers held aloof for the most part, as they could not come to terms with the packers, and of the 10,000 bags sold during the day the European shippers were the principal buyers. The Americans confined their small transactions to choice lots, and the general base of the day was 12$400 per arroba for No. 7 type Good average in Santos had dropped to 7$750 per 10 kilos. There was no news of interest from foreign markets. There was more animation in the local market on Thursday, but no change in the rates of the previous day as far as business between packers and factors was concerned The demand on the part of the shippers was chiefly confined to the selected types, but in spite of the low offers of the American exporters the packers were firm, and the 9,000 bags sold were bought on bases of 12$400 and 12$500, at which latter rate the market closed firm. In Santos good average fell to 7$700 per 10 kilos The foreign markets were unchanged during the day Friday was a dull day here. The packers bought readily from the factors on a base of 12$500 per arroba for No. 7, but the purchases made by the latter were mostly of choice coffee, which was bought in on a base of 12$500. Santos remained un-

changed from the previous day. New York reported a fall of 10 points, and Hamburg a small drop, but Havre and London were practically unchanged. On Saturday the local market was again dull, and the few transactions realised between packers and factors were on bases of 12$400 per arroba No. 7. The shippers again concerned themselves only with select types, and 7,000 bags were sold for 12$400 per arroba. There was no change of interest in Santos or abroad.

A BIT OF THE TRUTH.

The most pertinent and startling question ever asked is this—"*What is truth?*"

A Roman Governor propounded it once, under circumstances which greatly worried and perplexed his official mind. And he was not the first man or the last—not by myriads. So far as I know there has been no satisfactory answer. Some people (radicals and come-outers of various sorts) fancy that in this, the tail-end of a rather braggart and conceited century, they have flushed a fairsized covey of truths by firing speculative shotguns into every wayside bush and bog.

But have they done it? No, gentle reader, no. They have put up crows and sparrows, the same crows that picked the bones of the cave dwellers, and the same sparrows that sold two for a farthing in the time of Pilate. There were plenty of fools of old, and there are plenty now. The ancient doctors, indeed, prescribed some horrible stuffs as medicine—they used electuaries of viper's flesh and recommended pomegranate seeds for toothache because those seeds resemble human teeth. Very shallow and silly, to be sure, this sounds to us. But if you wanted to find things that come very near matching them in modern practice, I could show you where to look. On my table I have a list, of about 300 new "remedies" introduced to a suffering world within the past twelve-month. "Must be some good ones among them," do you say? Possibly. Time will tell. Meanwhile let us stick to whatever we are sure of. "We learn how to cure diseases," said Celsus, "by experience, not by reasoning."

"Some of the greatest truths in medicine," said a learned Scotch doctor, "came by the humblest means; not by synthesis or venesection, but by the observations of peasants and the experiments of motherly women.

Concering a medicine discovered by one such woman, thousands of stories have been told and letters written. Here is an example:—

"For many years I have suffered from indigestion and weakness. I seemed to have no energy for anything. I had a poor appetite, and what little food I ate caused me violent pains at the chest and between the shoulders. Frequently I had attacks of giddiness, and when I stooped I suffered from an unnatural rush of blood to the head. The pain which I was called upon to bear was often very severe; it affected all parts of my body, and at night I got little proper and refreshing sleep on account of it.

"As time went on and the complaint grew fixed upon me, I came to be exceedingly weak, and now and again was obliged to take to my bed. I lost flesh and became quite thin, living, as I did, only on milk, beef tea, and other kinds of liquid food. It will be understood, of course, that I had medical care, besides attending the South London Dispensary. Yet I received no benefit from what was done for me.

"It happened that in January, 1889, a freind, Mr. Pullen, told me he had suffered in a similar manner and been cured by a remedy called Mother Seigel's Syrup. Acting on his suggestion I got a bottle, and after having taken it found great relief. Presently my appetite returned and food no longer distressed me. Convinced that Mother Seigel's Syrup was adapted to my ailment, I continued the use of it until it was no longer needed. My health and strength were re-established, and I have since been well. This medicine had done what no others had been able to do. My husband, who suffered from biliousness, used it with the same result. You have my free consent to publish this brief statement if you desire to do so."—(Signed) Mrs. Julia Massey, 133, Lorrimore Road, Kennington, London, S.E., January 20th, 1898.

There is no royal road to the discovery of truth or knowledge. Anybody may find it anywhere. It is not always he who seeks that finds. Valuable discoveries are usually made by what, for lack of a better word, we call accident. The medicine that *cures* is the medicine we want, no matter whether it is old as the earth or was picked up yesterday in the fields by a child. That Mother Seigel's Syrup *cures* is proved by a cloud of witnesses. *It is a bit of the truth.* Therefore it will not die out, and nothing can take its place.

MARKET REPORT.

By Mail advices of 7th inst.

COFFEE.

The *London Commercial Record* says:—The public market reopened yesterday, when very heavy supplies were catalogued, but not more than one-third was able to be brought forward, the remainder being postponed. The quantity offered consisted almost entirely of Costa Rica and other Central American descriptions, the demand for which was irregular and, in many instances, a decline of about 2s per cwt. was accepted, but fine colory qualities sold with fair competition at about previous prices. "Futures" have been quiet and rather easier here, but on the Continent and in New York prices show a slight advance, closing rates being:—

London	Santos	July delivery	28s 9d
New York	No. 7 Rio	„ „	5.20 cents.
Hamburg	Santos	„ „	30 pf.
Havre	Santos	„ „	35¼ francs
Holland	Good ordinary Java		27½ cents.

The Dutch Trading Co. announce their next public sale for Tuesday, 11th instant, at Amsterdam, when 21,260 bags, 20 cases Java, &c., will be offered. Good ordinary is valued at 27½ cents.

Yesterday's auctions passed off as under:—

Nyasaland.—28 bags withdrawn.

Jamaica.—32 barrels 4 bags passed the hammer unsold.

Costa Rica.—3,855 bags mostly sold, good to fine ordinary 35s 6d to 41s, low middling to middling blue 47s to 56s, good to fine middling blue 58s to 76s, dull to fine bright bold blue 72s to 94s, fine bold 100s, pea-berry 60s to 87s.

Guatemala.—Of 325 bags catalogued 200 bags sold, fine ordinary brownish 40s 6d to 41s, good middling 63s 6d to 64s, pea-berry 45s to 69s 6d.

Salvador.—Of 130 bags offered only 8 bags sold, pea-berry 70s.

Nicaragua.—Of 45 bags offered, 3 bags pea-berry sold at 56s.

Colombian.—971 bags offered, and 700 bags sold, low middling to middling 48s to 54s, good to fine middling blue 55s 6d to 64s, good to fine bold blue 8s to 684s 6d, pea-berry 49s 6d to 71s.

Receipts in Rio and Santos.

	1898-9.	1897-8.	1896-7.	1895-6.
Since July 1				
Rio	2,665,000	3,702,000	2,977,000	1,991,000
Santos ...	4,907,000	5,552,000	4,562,000	2,760,000
Total ...	7,572,000	9,254,000	7,539,000	4,751,000
Crop	—	10,461,000	8,680,000	5,489,000

Auction sales to-day, which consisted of yesterday's postponed catalogues, embraced 4,940 bags East India, 448 packages Jamaica, 3,418 bags Costa Rica, 711 bags Colombian, 599 bags Guatemala, 145 bags Mexican, 228 bags Ecuador, 219 bags Nicaragua. Biddings were very slow and up to 4.30 p.m. the second sale had not finished. East India growths took up the greater portion of the time and were quitted at easier rates.

TEA.

Ceylon.—Public sales last month were rather larger, *viz.*:—92,900 packages bringing 8⅞d per lb., contrasted with 8½d per lb. for 73,300 packages in February, and 7¼d per lb. for 124,900 packages in March, 1898.

The feature of the month has been the steady rise in value of common to fair grades, quite 1d per lb., as these descriptions, from all producing countries, are becoming gradually scarce and there is no prospect of a further supply, except from Ceylon, for several months to come. There was excited competition at the auctions for Pekoe Souchongs, Pekoes and Broken Teas up to 8½d per lb., so that very little of the former was obtainable at 7¾d per lb., while the other sorts hardened in sympathy. Medium Pekoes and Broken Pekoes below 9½d per lb. were also in more request and generally dearer, but above that prices for the most part ruled irregularly, though the lines with attractive cup on the whole benefited by the better market. Quality was in most instances of a useful character, and the brisk flavour possessed by many invoices was liked by the trade. Finest lines were scarce, and only a few high quotations were recorded.

Deliveries are somewhat disappointing, although taken for the

nine months from 1st July, 1898 to 31st ultimo they exceed the imports by fully 1 million lbs., being 68,555,000 lbs. *versus* 67,489,000 lbs.

For the month of March:	1899.	1898.
Imports	8,190,084 lbs.	7,874,612 lbs.
Deliveries	7,310,692 „	8,095,844 „
Stock, 31st March ...	18,105,766 „	18,074,342 „

No public sales have been held in London. Messrs. Gow, Wilson and Stanton issue no circular, but as the month's figures have been published since their last circular was sent out, they write—

The increased deliveries of Indian tea are very encouraging, while the reduction in the stock is very marked. The smaller Ceylon deliveries during the past few months are doubtless accounted for by the somewhat higher prices which ruled for the lower grades of these teas during the greater portion of the season." The figures referred to are as follows:—

Deliveries of Indian tea during March were nearly one million and a half pounds above March last year. This brings up the increase in deliveries of Indian tea for the first ten months of the season to 13¼ millions ahead of the corresponding period last season; while the stock is 6½ millions below that at the end of March 1898. Smaller Ceylon deliveries are doubtless accounted for by the higher relative prices at which the lower grades of this growth were selling during a large portion of the season; but it is satisfactory to notice that the stock is practically the same as a year ago.

Movements (in lbs.) of Indian and Ceylon Tea from—

	1st June 1898 to 31st March 1899.		1st June 1897 to 31st March 1898.	
	Indian.	Ceylon.	Indian.	Ceylon.
Imports ..	134,212,606	77,266,270	133,389,215	78,782,754
Deliveries ..	119,886,559	76,153,798	106,572,938	80,661,592

IN CANADA.

The *Canadian Grocer* reports:—The strength of the Indian and Ceylon market is still the feature of the grocery trade. Some consignments have been stopped in transit and ordered to be forwarded to London, Eng., where they have been sold to much better advantage than they could have been here. This has, of course, added strength to the local market. It is understood that shipments consigned to the United States have also been stopped in transit and forwarded to London. Local brokers report an active demand for Indian and Ceylon teas on spot at about 14c. There are very few of these to be had, and, although quite a lot of these teas were sold during the past week at this figure, those who now have any are holding them over at less than ½c. per lb. more. Some pekoe souchongs on spot, which sold here a month ago at from 12½ to 13c. are now held at about 15c. The advices received here from Calcutta and Colombo indicate a very strong condition of affairs there also. A private letter received in Toronto this week stated that the writer was afraid that they would not for some time be able to get good teas to sell at less than 20c.

Japan teas are for the time being neglected, and prices are nominally firm.

On account of the high price of Indian and Ceylon teas there is quite a demand for China black teas. The teas wanted are chiefly from 10 to 11c. per lb., but, as there are not many of these teas offering, there have not been many transactions.

China green teas appear to be as firm as ever, and holders fully expect that the market will rule even higher than it is now.

COCOA.

Public auctions have been suspended owing to the Easter holidays; the private transactions have not produced any material change in prices, their extent being somewhat small.

Import, Home Consumption, Export and Stock of Cocoa in London are as follows:—

		1899.	1898.	1897.	1896.
Imports, B.P.	bags	54050	65246	47372	54172
Foreign	...	18986	43375	21882	19557

Stock, B.P.	...	59392	81058	83186	86515
Foreign	.	43888	50920	48147	72462

PEPPER.

Black.—The market is firm in tone but business is quiet. On the spot sales of Singapore have been made at 5¼d to 5$\frac{9}{32}$d basis fair. For arrival no sales reported; June-August shipments has buyers at 5$\frac{9}{16}$d.

The shipments of Black Pepper for the month of March compare as follows:—

	1st half.		2nd half.	
	1899.	1898.	1899.	1898.
U.K.—Sing ... *nil*	40	70	50	*nil*
„ Penang ... 40		170	*nil*	170
	40	240	50	170
Continent ...	30	160	70	120
United States ...	220	20	110	70
Total tons...	290	420	230	360

In *White* very little business done. Singapore, June-August (s.) is quoted at 8¾d, and Penang June-August at 8$\frac{3}{16}$d.

The shipments of White Pepper for the month of March compare as follows:—

	1st half.		2nd half.	
	1899.	1898.	1899.	1898.
U.K.—Sing ... 140		60	80	*nil*
„ Peng ... 50	190	240	90	230
		300	170	230
Continent ...	*nil*	100	120	30
Total tons ...	190	400	290	260

SULPHATE OF QUININE

Has suffered a decline of 1d to 1½d per oz. on sales to secure profits, but as all the cheap stuff offering is bought up by large holders of the article any depreciation of values can only be temporary At the moment, however, the market is disorganized. B&S or HB has been sold on the spot at 1s 7¾d down to 1s 7d, June delivery 1s 8¾d down to 1s 8½d, and August at 1s 8½d per oz. About 100,000 ozs. are reported sold.

Closing Report:—A semi-panic, and almost all positions done at 1s 6d. including August, but at the close no sellers under 1s 7d. 30,000 to 40,000 ozs. sold.

INDIA RUBBER.

With the holidays and buyers occupied with the large April tenders there is scarcely a transaction to report in Para, and sellers of fine hard at 4s 4d, soft at 4s 4½d; scrappy negroheads neglected. Dull competition in to-day's auctions and prices easier generally.

CARDAMOMS.

Mysores and Malabars of medium qualities have been dealt in to a fair extent at from 1*s.* 10*d.* to 3*s.* 3*d.* per lb. A large quantity will be offered next week. The Ceylon shipments from January 1 to March 14 were—

	1899.	1898.	1897.	1896.
Lb.	124,683	101,269	73,800	64,902

For the week ending March 14, 28,856 lbs. were shipped.

CINCHONA.

The Ceylon shipments for the week ending March 14 were 22,832 lb., bringing the total from January 1 to that date to 141,576 lb., as compared with 164,188 lb., on the same date in 1898, 87,355 lb. in 1897, and 72,056 lb. in 1896. In Amsterdam last week 1,134 bales of bark were received from Java. The bark shipments from Java during March 1899 have been 977,000 Amsterdam lb., against 700,000 in 1898, 504,000 in 1897, 557,000 in 1896, 449,000 in 1895, 522,000 in 1894, and 626,000 in 1893. The totals from January to March were: In 899, 2,025,800 Amsterdam lb.; 1898, 2,356,000; 1897, 1,350,000; 1896, 2,073,000; 1895, 1,862,000; 1894. 1,873,000; 1893, 1,881,000.

The London warehouse stock is now about 1,100 packages below that at the end of last year. It is smaller than it has ever been before in the last seven years at the corresponding date The arrivals up to March 31st were 4,108 packages, which is only reduced on by 1897 of the last seven years. The deliveries are 5,220 packages, which is about the average of the same years.

Amsterdam Bark Market.—The shipments of Cinchona bark from Java for the month of March, and the period January 1st to March 31st, during the last seven years, stated in English pounds are as follows:—

	1893.	1894	1895.	1896.	1897.	1898.	1899.
March ...	684,687	570,937	491,094	609,304	551,250	765,625	1,068,594
Jan.-Mar. ..	2,057,344	2,048,594	2,086,562	2,267,344	1,485,467	2,370,875	2,[illegible]

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittance, should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday the 12th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Coorg.

Polli Betta, *2nd May—Weather.*—Last Monday and Tuesday there was very heavy rain here accompanied by hail. Since then it has been fair with passing clouds, though it has been raining in other parts of the country. *Crops.*—Some crops appear to be good on the Siddapur side. It is apprehended generally, however, that the heavy rain on the blossom has done a lot of injury. Labour is plentiful, and removing borer trees and supply holing have been started. *Health* good.

ENTOMOLOGY IN CEYLON.

In giving elsewhere copious extracts from the report for 1898 of Mr. E. E. Green, Honorary Entomologist to the Government of Ceylon, we enable our readers to judge of the excellent work that this gentleman has done. Knowing what wide scope there is for work of a similar kind in Southern India, they will no doubt share our surprise that the Madras Government should remain supine in regard to such an important matter. Mr. Green writes interestingly of various pests, many of which must be familiar to planters in Southern India. The lantana is pest enough in many places, but the lantana bug is one of those little pests that big pests have to worry them, and that are so apt to worry others than those by whose name they are best known. The lantana bug is said not to find the tea plant congenial, but we should scarcely care to trust it were more congenial fare missing for a time. Then *Helopeltis* (mosquito) has been very prevalent in some of the low districts of Ceylon. In the dry cool weather, it seems to lie low. With the April rain it comes forward again, and increases rapidly. Mr. Green says this is the time to attack it. Just when they may be assumed to be in the full glory of their rising strength, the survivors must be killed before they have

had time to propagate. Details will be found in the report, though Mr. Green observes:—"Our knowledge of the life cycle of *Helopeltis* is not yet complete, and will be made the subject of future investigations. While 'all alive' the insects can be studied, but it has yet to be learnt what becomes of them during the resting season. A certain proportion must hibernate and reappear in the spring, or resting eggs may be deposited and remain unhatched for several months." The determination of this point is, says Mr. Green, most important.

Coolies employed to catch *Helopeltis* have brought in several other plant-sucking *Hemiptera*, notably the *Capsus rama*, (Kirby.) a greenish insect with transparent wings, which is often present in large numbers on the blighted tea. Again, the shot-hole borer, *Xyleborus fornicatus*, (Eichoff,) is reported to have done much injury to tea, chiefly at the time of pruning "when the cut surfaces of the affected stems look as if riddled by small shot." Extensive defoliation of tea-plants by the caterpillars of *Heterusia cingala* is also referred to. These are said to appear in thousands and to eat every leaf off the trees. They are, so to say, the locusts of the tea-plant. Mr. Green states, however, that all these excessive plagues of caterpillars send on 'pilots' beforehand. They are, in fact, preceded by "smaller broods which, from their affecting perhaps one or two bushes only, are overlooked or considered to be of no importance." The planter's aim should be to destroy the early brood promptly. As with the cloud no bigger than a man's hand that threatens a destructive storm, so with small broods of caterpillar. Take the warning, and prepare in good time. Several caterpillars have been prominent among the tea in Ceylon. The *Orygia postica* (Wlk.) is referred to. The Tea Tortrix, *Homous fasciculina*, again, and the leaf roller, *Gracilaria theivora*, (Wlsm,) claim a connection with the caterpillar world, and they and their progeny should be carefully seen to. Mr. Green explains what they are, and how to deal with them. The yellow tea-mite, *Tarsonymus sp.* is also referred to as having displayed unusual activity and certain termites of undetermined species are reported to have damaged tea bushes in certain districts.

With Dr. Watt's comprehensive book and such annual reports as those of Mr. Green's, the planter is armed against the invasion of his estate by pests. But he must keep his arms bright and ready for the fray. He must post himself up, and keep himself well informed He must be ever observant, and must learn to distinguish pest from pest, "hostile" from "friendly." As regards remedies, Dr. Watt lays down general rules and describes many special systems. Men like Mr. Green record the progress of investigation and experiment from year to year. In the report under notice, Mr. Green states that the question of quarantining and fumigating imported plants and fruits has been under consideration. Prevention of this kind is advocated, because the green bug of coffee and the lantana bug are both said to be importations. Then there is the lady-bird remedy to be thought of. Mr. Green's remarks on this point are merely an elaborated account of facts that he has previously enabled us to place before our readers, but this does not detract from their interest. There is certainly one new point: the record of failure in the attempt to export lady-birds from Ceylon to the Cape per post; but this merely shows the uncertainty that must attend experiments of the kind referred to. Delay in course of transmission per post, and consequent disaster. This, however, affords no ground for despondency. In the world of science, more perhaps than in other branches of life, men learn to profit by their own failures. Experience gained means additional strength, and in this matter of the use of lady-birds as "friendlies," the planter has still a great deal to learn. Whether he uses "native" or imported allies, he must first study their capabilities. Here it is that the want of a scientific Entomologist is, and must continue to be, seriously felt. How long will it take to induce the Local Government to fill the gap that is so evident? The answer must depend largely on the manner in which planters take the matter up and urge their needs upon the Government.

ILLICIT COMMISSIONS.

A vast amount of comment and criticism has been provoked by a report lately issued by the London Chamber of Commerce. Some time ago, that body appointed a special committee to consider secret commissions in trade. We have not seen the report, but the remarks of different trade papers show that it reveals a considerable amount of illicit "financial arrangements" on the part of such a variety of trades and professions that we might almost infer that *all* are included. Mr. David Howard, of Quinine fame, was Chairman of the Committee; and no less than twenty of the Trade Sections of the Chamber were represented on the Committee. The evidence taken was mostly given anonymously, and was to the effect that in some trades the practice referred to is increasing. In some instances it is an established "custom of the trade," though illegal for all that. Among instances cited is the following:—A pharmaceutical chemist stated that "secret commissions are given by chemists to medical men on their prescriptions supplied to patients, in some cases amounting to from 25 to 50 per cent. on the price charged by the dispensing chemists." The *British Colonial Druggist* remarks:—"This is an evil the existence of which we cannot deny." As if to show, however, that, bad though this is, there are worse examples offered by other trades, our contemporary says elsewhere:—"The Chamber's report mentions the case of produce brokers taking secret commissions and we are afraid that the brokers have their dishonourable members like the rest. But such instances as we have heard of do not lead us to withdraw what we have said, that the drug and chemical trades, taken altogether, are freer of the evil of bribery than most trades." It is the old story of the tanner: "there is nothing like leather." Yet things must be in a bad way indeed when a trade organ can find nothing more cheerful to say than, "Well, our trade is corrupt, but most others are worse." The allusion to produce brokers, however, brings this matter home to our planting readers, for it is certain that some of these brokers not only *receive* secret commissions but *pay* them. The reception, then, may be taken as connected with the sale price; the granting of them is to strengthen a connection with importing merchants, who, paid a commission by the planter-consignor, for attending to his interests, often receive another from the broker for putting the business in his hands. We do not know if any Chambers of Commerce in India intend to support the

action of the London Chamber, but the matter is one that deserves the attention of the U. P. A. S. I., especially as the Association is in a manner affiliated to the Chamber. Every effort to reduce the profits of the middleman and to have the charges of "Commission Agents" put beyond suspicion of unfairness, is an effort in the right direction. The producer and the consumer must be brought as close together as possible, so that the maximum of return to the former and minimum of cost to the latter may be attained.

THE LABOUR QUESTION IN BRAZIL.

The manumission of slaves inaugurated an era of labour troubles in Brazil, but the selfish hopes of those who thought that it was the beginning of the end of cheap coffee cultivation in Brazil have been disappointed. Rising to the occasion, the authorities took measures that have met with considerable success, and free labour has been substituted for slave labour in such manner as to allay all fears concerning the future of the coffee industry so far as this depends on the supply of labour at moderate rates of wages. In the State of S. Paulo, for instance, there has been practically no check to rapid agricultural and industrial development. When, in 1889, slavery was ultimately abolished, no compensation whatever was offered to slave-owners. They, consequently, not only lost heavily in capital but were threatened in their income also in consequence of the impossibility of continuing the cultivation of their estates. Foreseeing this, the State of S. Paulo took the initiative and, even before emancipation was actually legalised, initiated the importation of free labour that, energetically developed by successive governments, has proved the salvation of that important State.

The cost of this was great, no doubt, but Brazil is believed to stand alone in having witnessed the abolition of slavery without payment of any compensation whatever, and without disturbance or temporary suspension of ordinary pursuit and activity. Indeed the *Brazilian Review* asserts that no period of Brazilian industrial history evidences greater activity than that which immediately followed emancipation. Not only did agricultural enterprise, until then almost absolutely dependant upon slave labour, not decline, but plantations were positively extended in such a manner as to nearly double production within ten years! The same contemporary observes that the last contract authorised by the State of S. Paulo was for the introduction of 60,000 immigrants in 1897; of these, 44,000 adr- been imported up to 31 Dec. 1898, of whom 25,184 entered year 1898, consisting of:

Italians	18,946
Spaniards	3,262
Portuguese	2,278
Austrians	426
Germans and Swiss	272

This shows what a heterogeneous population is being collected in the State; but, after all, it is a population of white men, and Brazil would appear to be free from any risk of the grave danger that now menaces the United States of America in the preponderance of political power on the part of the coloured race. It may have to take precautions against the mania for revolutions that seems to afflict its smaller neighbours in South America; but that should not be very difficult.

FERTILIZER LEGISLATION IN THE UNITED STATES.

A subject of very great importance to the agricultural community is under discussion in the United States. We should be very glad to see it taken up also in Great Britain and in India. At the last meeting of the U. P. A. S. I., allusion was made to the fact that planters have sometimes to try artificial fertilizers almost in the dark. In some instances, there is a statement of the component parts of an artificial manure, but no guarantee; and where there is a guarantee, it is often misleading, because put at such a very safe level as to give scarcely an approximate idea of the availability of nitrogen or potash or phosphoric acid in the fertlizer. In America, where artificial manures are very largely used, this difficulty has attracted considerable notice. The Association of Official Agricultural Chemists and the Association of American Agricultural Colleges and Experiment Stations lately appointed Committees to confer together on "uniformity in fertilizer laws." In a state composed of many states, each with its own form of laws, there is always a tendency for these to differ materially, and it is not surprising that, now that America has begun to recognize the need for legislative uniformity, this particular subject of laws relating to fertilizers should have come under consideration. If surprising at all, the action taken will be wondered at simply because it has been taken so late.

From the recommendations of these Joint Committees a great deal may be learnt that might be of the utmost service to law-makers in Great Britain and in India. The recommendations run upon lines that might also furnish a good guide to the adoption of a sound law as to the Adulteration of Foods and Drugs, for the Joint Committee has manifested a tenderness as to the ingredients of plant-foods that even American legislators have not yet shown with respect to the articles of human food and drink that are publicly offered for sale. The main recommendations of the Joint Committee are that all substances containing nitrogen, potash or phosphoric acid, sold, offered or exposed for sale for manurial purposes, excepting the dung of domestic animals when sold as such, should be subjected to inspection. An important omission from the exceptions is nightsoil, unless the "domestic animal" phrase is vastly comprehensive. Each package of manurial substances (as above deposed) sold, offered or exposed for sale, should bear a printed, legible guarantee, a statement of net weight the brand, name or trademark, the name and address of the manufacturer, and a note of the percentages of the manurial ingredients. As regards inspection, it is suggested that (1) The guaranteed statements on the packages forwarded to the Inspectors need not be in the form of an affidavit. (2) Sealed samples of fertilizers offered for sale need not be sent by the manufacturers to the Inspectors. (3) In lots of 5 tons or less, samples should be drawn from at least 10 packages, or if less than 10 packages are present, all should be sampled: in lots of over 5 tons, not less than 20 packages should be sampled. Duplicate samples should be drawn and sealed in the presence of the party or parties in interest, or their representatives, one of the samples to be taken by the collector and the other left with the party whose goods were inspected, subject to the call of the manufacturer. When examinations

are made, it is recommended that the methods of the Association of Official Agricultural Chemists be used, and the following miscellaneous recommendations also find a place in the Joint Committee's report :—An imprisonment clause for violation of fertilizer laws should be omitted. Manufacturers should not be obliged to secure bondsmen. Commercial valuations should not be affixed to the published analyses of manurial substances. A definition of the term "brand" should be inserted wherever a brand-tax is assessed. It will be seen from this that the rights of the fertilizer manufacturer have been considered, as well as those of the agriculturist.

Among the recommendations under reference are also sundry items stating what the manufacturer should be called upon to guarantee, and here, too, almost absolute uniformity is wisely aimed at. The chief points are as follows :—Total nitrogen should be guaranteed in all cases, and nitrogen in the form of nitrates or of ammonium salts should be guaranteed separately, if the manufacturer desires credit therefor. Total phosphoric acid should be guaranteed in all cases, and soluble, reverted and insoluble separately, if the manufacturer desires credit therefor. Potassium should be guaranteed as potash (potassium acid) soluble in water. When chlorine is present in fertilizers, manufacturers shall guarantee the maximum percentage thereof. In other cases than that of chlorine, only statements of the minimum amount of the substances present shall be given. For instance, instead of guaranteeing from 2 to 4 per cent. of potash, guarantee should read thus : "2 per cent. of potash." The guarantee should state the ingredients guaranteed in the following form and order :—

„	..	...	per cent. phosphoric acid soluble in water.
„	..	..	per cent. phosphoric acid reverted.
„	...	...	per cent. phosphoric acid insoluble.
„	...	.	per cent. phosphoric acid total.
„	.	...	per cent. nitrogen in nitrates.
„	..	...	per cent. nitrogen as ammonia.
„	...	...	per cent. nitrogen total.
„	...	...	per cent. potash soluble in water.
„	...	...	per cent. chlorine.

Ingredients not present should be omitted for the guarantee, and no other form of statement should be interpolated.

HIGH-GROWN CEYLON TEAS.

An experienced tea-planter in a comparatively high district of Ceylon writes that there has been plenty of rain, and tea has been flushing heavily, so much so that he fears the quality will be much poorer. Crops for the first quarter have been disappointing. He adds :—"Some time ago I had a letter from Mr.————, in which he says : 'In London I had a talk with the manager of a tea-dealing firm who have confined themselves all along to pure Ceylon tea, and he told me that Ceylon tea had fallen off so much from its strength of past years, that he thought, if they were to keep their customers, they must resort, as he said many firms have done, to fortifying Ceylon with the stronger teas from India.'" The *Observer* comments on this to the effect that there can be no doubt of the superior teas which virgin soil gave (and gives) for a few years in Ceylon : the question now is, can planters by manuring or cultivation, or improvement in manufacture, make up for a certain falling-off in strength and flavour as estates get older? This is part of the problem now being tackled by Mr. Kelway-Bamber. It is also being partially investigated at least so far as manuring is concerned, by many practical managers. That is to say, tea-planters are trying to feed their plants well before they fail, or before disease gets a firm hold of them, as it probably would do in time if they were starved or overworked.

TAMIL LABOUR IN SELANGOR.

At the Annual General Meeting of the Selangor Planters Association at Kuala Lumpur, on 25th February, the Chairman, Mr. Carey, proposed "that in view of the increasing demand for Tamil labour in this State, it is desirable that an understanding should be arrived at amongst employers with respect to the employment of labourers from other estates, and this Association is of opinion that members should individually guarantee to knowingly employ no cooly or gang of coolies from another estate without the express consent and goodwill of their previous employers. In order that fair play may be assured in every case and that the liberty of the coolies may not be unreasonably curtailed, all employers shall have the right of appeal to the Committee of this Association, whose decision shall be final and failure on the part of any member to comply with the Committee's ruling, should be at once attended by the prompt expulsion of such offending member from the roll of the Association. In cases where coolies who have been a cause of trouble to their previous employer, have been engaged in good faith and in ignorance of the facts on another estate, the Committee shall deal with each such case upon its merits and their decision as to the course to be followed shall be final, and neglect on the part of members concerned to comply with their ruling shall be attended by expulsion from the Association. Special emergency meetings of the Committee to deal with these questions will be held upon members advising the Honorary Secretary of their desire to have a settlement of such disputes arrived at."

This is a fairly lengthy resolution, but Mr. Carey explained that it was of vital importance that there should be combination amongst the planters so as to be masters of the coolies, or the coolies would be masters of the planters. In Ceylon great trouble had arisen through coolies moving about without reasonable restrictions, and in consequence advances had gone up by leaps and bounds until it had become a serious matter indeed for proprietors. In Ceylon kanganies left estates unless they got anything they wanted, and if Selangor planters were not careful they would find themselves in the same position. Under the present system a cooly can legally give a month's notice and leave the estate, and another planter would take him on ; but planting etiquette was stronger than law and the resolution would prevent coolies from acting in a manner which was unfair to their employers. The coolies' interests, however, must also be safeguarded, and in the case of a very unhealthy estate, they should be allowed to leave if such was their wish. Boycotting and unreasonable restrictions were obviated by the second part of the resolution, for it gave the right of appeal to the Committee, men in whom presumably the Association had confidence and who would see that no injustice was done. The latter

question was a most serious one, but treated on the lines of the resolution, there would be no friction. The resolution was carried unanimously. So it may be hoped there will be no reports of *cirmping* from Selangor, such as stirred our Ceylon friends' bile of late.

NOTES.

Colombo Tea Shipment for April. These are put at about 7,000,000 lbs. against an estimate of 7,500,000 to 8,000,000 lbs.

Tea Manufacture. We are compelled to defer commencement of the series of papers we have promised. A start will be made at an early date, however.

Fertilizers and Seed. Here is a hint from the States:—"Commercial fertilizers should not be brought into direct contact with germinating seed . . . It is highly improbable that potash, phosphoric acid, nitrogen, or lime used as fertilizers actually favour germination."

Nilgiri P. A. The Annual Meeting is to be held at the Masonic Hall, Ootacamund. There is a long agenda paper, including nomination of Honorary Secretary and Committee for the ensuing year; and various important questions of "planting politics."

Some Tea Statistics. Movements (in lbs.) of India and Ceylon tea during—

An Apology. Two extracts referred to in our Notes last week were, unfortunately, omitted by our printers. One is given to-day; the other has lost its virtue by now, so has been relegated to the waste-paper basket. We greatly regret the blunder, and trust that nothing of the kind will occur in future.

Sale of Ceylon Estates. The two Maskeliya estates, Bunyan and Avoca, the property of the late Mr. Tom Gray, were put up to public auction in London on the 26th ultimo by Messrs. Farebrother, Ellis, Egerton, Breach, Galsworthy & Co., and were purchased by Sir T. J. Lipton for £25,000 sterling.

Tea on the Continent of Europe. Regarding the important question of pushing Tea on the Continent of Europe, a Colombo paper understands that an extremely eligible Commissioner has been secured. The name has not transpired; but it will probably be published after the next meeting of the Thirty Committee. It is said that the name will at once secure general acceptance.

Analyses of Commercial Fertilizers in the United States. Vermont Experimental Station Bulletins state that three quarters of the total number of fertilizers inspected were above guarantee in every respect, nine-tenths were essentially equal to or better than guarantee, and all afforded the commercial equivalent of their guarantees. A good record!

London Tea Sales. Cabling to Colombo on the 27th ultimo, Messrs. Gow, Wilson and Stanton reported a fractional decline generally; teas with quality, weak. Pekoe Souchong 7¾*d.* (¼*d.* down) average 8½*d.* (unchanged), of 18,000 packages Ceylon Tea offered 15,000 were sold, and 11,000 Indians were disposed of out of 15,000 offered. Indian average was 9⅜*d.*

Colombo Tea Sales. At the Colombo public sales of 26th ultimo, about 8,478 pkgs. = 668,946 lbs. were offered, of which about 6,118 pkgs. = 480,834 lbs. were sold. A very depressed feeling was noticeable at the auctions, and prices generally were from 2 to 3 cents lower. Good invoices were offered from the following estates: Oakham, Annandale, Siriniawansa, Pallegodde, Palmerston, and Monkswood.

News from Sylhet. A Sylhet correspondent writes to the *Planter*:—Storm seems to be phenomenal this year, and in the tea district, very local. Our quarter is sometimes the scene of disaster, while close alongside the breeze has been little more than a zephyr. Manufacture is on full swing in most districts now, and the tea sales will soon be something to look forward to in the weekly papers. The first sale will probably be a month or so earlier than last year

A Coffee-growing Experiment in Bombay. The Annual Report of the Department of Land Records and Agriculture, Bombay Presidency, 1897-98, contains the following brief reference to Coffee:—"Little progress is reported to have been made by Rao Bahadur Morey in the cultivation of coffee on the lands leased to him in the Supa Petha. He has up to this time planted an area of only six gunthas, and the plants are not yet in bearing. Mr. Gogte, of Dipoli, has also got an old plantation of 200 to 300 plants, which he hopes shortly to extend if he can secure a money loan from Government.

Tea too dear! On his return from America recently the Ceylon Commissioner was reported to have expressed the opinion that Ceylon teas are too dear now for America, the rise of 2d. following on 5d. duty, being more than a people who care so little for

black tea, want to digest. Coffee—their national drink—they can have almost for nothing. On the other hand, men have been scouring the American cities for tea to be shipped to London! Some teas rejected by the United States Inspectors lately were bought for 2½d. in New York, shipped to London, and sold for 6¼d. They were rubbishy "China blacks."

Brazil is all right.

Coffee or no coffee, Brazil stands secure. Thus the *Brazilian Review*:—"The pessimists who can see only the length of their nose, forget in their lamentations that behind the fringe of settled coast there lies the vast and almost untrodden hinterland that waits only the touch of thrifty labour and ardent capital to wake its silent forest and lonely mountains to life and prosperity. However it may be delayed, it is bound to come at length. The future of Brazil is sure because it constitutes one of the few great reserves left on which Humanity is bound to draw some day or another, probably not very remote."

Queensland Coffee.

The London correspondent to the *Townsville Bulletin* writes as follows:—The four bags of Queensland coffee from the Kamerunga State Nursery were sold last week by public auction and fetched 42s. per cwt. The quantity was about 5 cwt. The price is low, too low to be profitable, but buyers would not pay right up to full market worth for such a small parcel. All people who tried the coffee speak well of it, but brokers tell me that they do not think it will pay to export coffee from Queensland, the expenses all round would probably be too high. The main thing required in economical coffee production is a plentiful supply of cheap labor. They suggest that the industry will progress in the colony in connection with local supply. *Apropos* of this matter, Mr. Wickham, an old Northern river planter, who, after a spell of planting in British Guiana had been on the Conflict Group, of which he has the concession for four years, arrived in London last Saturday. He says that in his opinion the slopes of the Bellenden Ker are admirably suited for coffee growing, and he entertains a hopeful view of the rubber industry in New Guinea and adjacent islands.

A good time coming.

This is the good old strain that an old New York coffee firm stands by. It says 'keep coffee stocks up,' basing its advice on conditions that are a repetition of the history of the coffee trade. As stated by one of the firms, higher prices will again return, as they have in the past. In 1886 there was an era of low cost, and the industry being unprofitable, the planters neglected their plantations and no new ones were cultivated. The supply was out of relation to the world's requirements, and an era of high prices followed, and this stimulated coffee planting in Mexico, Central and South America, and in time brought out an excess of supply and present low prices. In time there will be another reaction, due to crop failure a check to the industry, heavy increase in consumption—but just when no one can foresee. And so it is safe on the present basis of cost for dealers to carry full stocks of green coffee. There is no excess of fine coffee, and the result is the wide range in quotations—from 7 cents for low grade up to 33 cents for the finest raw Java. *Nil desperandum.* Coffee planters sing in chorus: "There is a good time coming" and "Wait till the clouds roll by"; and keep your spirits up until the luck turns a bit.

Good Tea.

Discussing "Facilities for making good tea," the *Ceylon Observer* shows that planters differ in their opinions on this point. One congratulates himself that the old fancied drawbacks to making good tea are being overcome, and that better tea is now being made on a majority of estates: another deals with the drawbacks as still potent factors. The two he gives prominence to are the scramble for quantity, and the attempt to cut down expenditure as much as possible. The inflated rupee compels the strictest economy, and the planter must show a saving on the cost per lb. of tea laid down. By sacrificing quality he attains this end; and if quantity yields a very slight profit, he excepts the inevitable, but at the cost of the estate's name in the market. Again, one is most emphatic that manuring is profitable and improves the tea, and records the heavy application of manures during the past two years on some estates with the best results; while the other is more cautious. He admits the improvement of tea by manuring, but doubts whether the results are generally remunerative—the fear being expressed that, if a continued downward tendency in prices rendered expenditure on manures impossible, the last state of the estate would be worse than the first!

Protection against Plant-diseases.

In a recent periodical (*Praktische Blätter für Pflanzenschutz*, January 1899) Professor J. E. Weiss, of Freising, gives results of some interesting experiments. He wished to test whether whole plants could not be treated as we do seeds, namely, by immersing them in some solution which would kill any fungi present without injuring the plants. He immersed plants of Hazel and Oak in spring-condition without leaves, also Box and Privet with leaves, in 1-per cent. solution of copper-soda mixture. After being twenty-four hours there the roots were uninjured, and the plants, on being planted-out, grew perfectly. He recommends that all plants brought into a garden from outside sources should be treated in this mixture for one or two hours before planting, thus ensuring the killing of any fungi they might have carried in. The 1-per cent. copper-soda solution is made in the proportions—3 oz. copper-sulphate, 3½ oz. washing soda, and 4 gallons of water. The two substances are dissolved separately in enough hot water, then poured together, and water added up to 4 gallons. This is a weak solution, but for delicate plants may be still further weakened by adding more water. Where plants are suspected, it seems a safe precaution to take. Further experiments are being conducted.

The Destruction of Tea in the United States.

Mr. William J. Buttfield, an importer of teas in New York, has begun a suit in the United States Circuit Court to test the legality of the regulations established by the Secretary of the Treasury in February, 1898, relative to the standard of teas imported into this country. Collector George R. Bidwell, Isaac McGay, Examiner of Teas at this port, and Thaddeus S. Sharretts, Wilbur F. Lunt, and James A. Jewell, General Appraisers, are

named as defendants. The complaint alleges that the defendants have refused to permit the complainant to import teas, and have seized and destroyed certain teas imported by him which were of purity, quality and fitness for consumption equal to the standard, because they were of a test-cup quality and appearance in size or colour of leaf different from the standard as fixed in the regulations established by the Treasury Department. In fixing these regulations complainant alleges that the defendants disregard the true intent and meaning of the Act relative to the inspection of teas. He contends that the regulations of February, 1898, are illegal and void, because the Secretary of the Treasury has no authority to determine as to the kind of tea admissible for import, and because the seizure and destruction of rejected tea is beyond the power of the law. The complaint alleges that he has $200,000 worth of tea laden and *en route* to America, which, under this construction of the Statute, is liable to rejection, seizure and destruction. He asks for an injunction restraining the Collector from rejecting, seizing, or destroying any teas imported by him pending the determination of the suit.

Pepper.

At the present time, says the *Grocer* of 8th ultimo, there is no description of spice the statistical position of which, at the port of London, is more favourable than that of black pepper, and it is hardly possible for it to become weaker yet awhile. The landings during the first quarter of the year have been restricted to 670 tons, in contrast with 2,015 tons in the same period of 1898; and as the combined deliveries for home use and export were augmented to 1,660 tons, instead of being only 1,100 tons, the remaining stock has been diminished to 6,280 tons, against 6,575 tons a twelve-month ago. As a consequence the market has vastly improved, and prices are 1*d.* per lb. higher than they were in April last. The advance in white pepper is even greater, say, 1½*d.* on the rates of a year back, but the reasons for it are nothing like so cogent as those for the kindred condiment, because no real diminution in the supply has taken place. A few days later the *London Commercial Record* wrote that it understood that the appearance of plague in Calcutta was responsible mainly for the prevailing stagnation in the pepper trade. Our contemporary observed:—Calcutta dealers, at the moment, evince, owing to the plague, very little interest in Tellicherry pepper. Prices in India have become, therefore, almost stationary, with a tendency in buyers' favour, which cannot fail to have a depressing influence on European speculators who, in the face of large arrivals, look in vain to India for support. A strong Indian market would inspire our operators with fresh confidence, and would create a better demand here, particularly if some reliable information as to the actual size of the crop and quantities unsold could be procured. Such information, however, is not forthcoming. We are told that the crop is estimated at about 4,000 tons, but of which about 2,000 tons have been sold, which means about 2,000 tons more to be divided among the pepper-consuming countries. At the first glance, this looks a formidable quantity, but it is, in reality, not so large as it appears, considering that these 2,000 tons will have to fill all demands until the appearance of the new crop in the winter of 1900. But, still, it is a quantity large enough to prevent an absolute dearth of pepper.

LETTERS TO THE EDITOR.

"CHEESINESS" IN TEAS.

Sir,—With reference to "Cheesiness" in tea, my experience is that it is not caused by damp or sappy wood, but by exposing chests, after being packed, *but not soldered*, to damp air At the time I had complaints it was the custom to take the chests into an open verandah to be soldered, and while there the dry tea must have been absorbing moisture. Afterwards I took to soldering in the tea-house and have had no complaints. My chests are made on the estate, and I use them as required, whether sappy or dry.

1*st May* 1889. E. M. Ewart.

GENERAL ARTICLES.

VANILLA.

The following is a translation by Mr. S. Wilhelm Rowntree, of York, England, from Sempler's "*Dietropische Agricultur*":—

Botanical Observations.

Vanilla is the generic name of epiphytical orchids indigenous to tropical America and Asia.

During their first stage of development they strike root and obtain nourishment from the ground, then they creep up trees to a height of 30 or 40 feet by sending out thread-like roots from knotty stems.

The stem is from 2 to 3 centimetres thick; the leaves grow in two long rows and are long, green, and fleshy. Clusters of blossoms grow out at the angle between stem and leaf; they are large and fleshy, and of a whitish yellow colour and pleasant odour. Following the blossoms come cylindrical pods, 8 or 10 inches long, which split on one side, and are filled with a number of small black seeds. The latter suggest sand they are imbedded in similarly coloured pulp.

The fruit is yellow when ripe. On drying, it turns black, and forms the well known spice.

The number of members of this family is not yet established; indeed some difference of opinion exists whether these are species or only varieties.

It has not yet been exactly determined which kinds of fruit are utilized, either in the trade or at the place of production.

In Mexico 4 useful kinds are known:—*Vanilla sativa, V. sylvestris, V. planifolia and V. pompona.*

In Guiana:—*Vanilla guianensis* with large yellow blossoms and long fruit.

In the province of Bahia:—*Vanilla palmarum.*

In Brazil and Peru:—*Vanilla pompona and aromatica*; the latter notwithstanding its name, having the least pleasant odour

The search for useful varieties is still progressing. The Director of the Botanical Gardens in British Guiana is just making the experiment of planting all the varieties indigenous to the whole of Guiana on his trellises (? misprint for Gelange, stretch of land) in order to determine which can be recommended for planting and generally how to graduate their values.

If there are still many questions to be solved about the Vanilla family, we do at least know definitely that the earlier theory, that most of the Vanilla of commerce comes from the *V. aromatica* is a mistake *V. planifolia* should take its place.

This kind furnishes the most valuable fruit, and is therefore brought into cultivation wherever Europeans are concerned in the Vanilla culture. What part the other kinds play in the production of the article of commerce it is impossible to say, even approximately.

The *V. pompona* seems to be rather important, for their short, thick pods, easily recognised, are always on the market (though in small parcels), indeed they have received the distinctive name, Vanillon.

Its value is considerably less than that of *V. planifolia* fruit, frequently only one quarter.

Apart from the useful varieties, the Vanilla family has only a purely botanical interest, for the blossoms do not possess the wonderful colour which distinguishes most orchids and ensures their high rank in-horticulture.

General Survey of the Production.

Vanilla was introduced into Europe in the 16th century from Mexico, which was the chief place of production at that time, as it is at the present day.

The total crop of this state was given as 108,500 half kilos, in the last published Statistics for 1880. One cannot take this as literally true, for the official machinery does not allow of an exact estimate being taken.

The output of Vanilla is still very considerable, and is not exceeded by that of any other country.

The chief seat of the industry is in the State Vera Cruz, the next in Oajaca The village Zentilla in the latter State is said to produce the finest Mexican Vanilla

The Vanilla culture is also more or less developed in the States of Tabasco, Yucatan, Chiapas, on the Isthmus of Tehuantepec and in a few places on the West coast as well as in the hinter land of Acapilco and Mazatlan.

As a rule, 5 kinds of Mexican Vanilla are recognised: —

(1.) Vanilla *fina* or *primiera*, the pods are at least 24 c. m long,
(2.) *Chica prima* is shorter and thinner,
(3.) *Zacate.*
(4.) *Rezacate*, and finally
(5.) *Basura*, mark degrees in size.

The last named is not only the smallest, but is spotted, and often damaged. These varieties differ not only in size, but often in the contents of the pods.

In Guatemala, the Vanilla is not cultivated for purposes of commerce; the Indians, however, collect the wild fruit in the forests of the North West coast, and bring them on the market at the Capital.

A few hundred pounds are exported from thence in some years, in others no pods are exported.

In the rest of Central America nothing is known of the culture of Vanilla, or of collecting the wild fruit.

It is a little better in the West Indies, where deficient experiments in planting have been made, but soon abandoned.

Here and there a few hundred shrubs are cultivated, the output is used for home consumption.

Guadeloupe alone exports small quantities to France, the annual amount varying extraordinarily. The exports amount in one year to 150 kilos, in the next to 1,500 kilos. In the year 1880, it amounted to 2,656 kilos.

Although wild Vanilla grows luxuriantly and abundantly in the forests of Venezuela and Guiana, its culture is completely neglected.

Attempts have recently been made in British Guiana to revive it.

The Brazilian Vanilla does not enjoy a good reputation; this is a consequence of the neglect in preparing the crop.

A considerable part of the fruit is collected from wild shrubs, and is consequently of little value.

What I have previously said about this country's Cocoa applies accurately to its Vanilla.

The Vanillon, alluded to above, comes for the most part from Brazil. It is almost all used in France.

During "the fifties," a series of bad harvests seriously damaged the sugar industry in Reunion, and caused the planters to turn to Coffee and Vanilla cultivation, with such results that this island has become, after Mexico, the chief source of this spice.

Not only that, the methods of cultivation have been brought to the highest degree of perfection in Reunion, and we must turn there to learn how the industry has advanced. The exemplary French statistics afford us also a dependable insight into the advance and present position of Vanilla culture—an example which awaits imitators in this special branch.

The Statistical Tables show that in 1866, 223 hectares were planted with Vanilla shrubs, furnishing a total crop of 15,494 kilos.

In 1871, the area covered was 593 hectares, and the harvest 25,547 kilos.

In 1874, area 1,563 hectares, and harvest 43,959 kilos.

At the beginning of the "eighties," the average harvest amounted to 50,000 kilos, and the area of cultivation about 1,800 hectares.

The latter cannot be sharply defined because it is increasingly the custom on this island to plant the shrubs in suitable places scattered over the ground. This is especially the case with the small landed proprietors who are mainly attracted to this industry.

This is readily comprehensible, for the cultivation of Vanilla is suited to the "small people" owing to the great value of the product, rendering possible the maintenance of a family of modest wants on a bit of land too small to allow of Sugar or Coffee cultivation.

A further advantage is, that it is not requisite to employ machine power or labour beyond that of the family, if working on a small scale.

The French have likewise introduced the cultivation to Tahiti, but according to the latest intelligence, only 30 hectares were planted, of which 2,000 kilos. of fruit formed the average crop.

The example of Reunion was soon imitated by the neighbouring island of Mauritius, but with less energy, for both before and since sugar has been regarded as the staple article of the island.

Statistical estimations of the export are available, not of the production.

From 1865 to 1873, the export amounted on an average to 5,000 English pounds (equal to 4,500 half kilos.), from that time the export increased to an average of 12,000 pounds per annum.

Mauritius possesses a few other orchid species, the leaves of which may replace Vanilla for the perfumer.

Angraecum fragrans, which when crushed emits an odour which powerfully reminds one of Vanilla—some profess to recognise an admixture of the odour of Tonquin (?) beans. The leaves of Fahan orchids should be mentioned, yielding an aromatic tea which is so much valued that this plant has been introduced into St. Helena and Madeira, and the leaves into France. The leaves of *Orchis fusca* emit a similar aroma.

About 1840, the cultivation of Vanilla was introduced into Java, but it has only engaged attention in recent times.

Planting has been energetically taken in hand in Ceylon. It is still a question, however, whether the enthusiasm will prove lasting, and whether this island will form an important source of Vanilla.

Vanilla thrives well in Madagascar, and is even cultivated on a small scale. The output is trifling, and, since the war with France, has completely ceased.

The refreshing action of Vanilla is due to an alkaloid named Vanillin, so closely allied to benzoic acid that it was previously considered identical with it.

Vanillin often crystallises out on the pods in the form of fine needle-shaped crystals—sometimes only years after picking.

The crystals notoriously influence the value of the article they are regarded as a measure of quality. This measure is occasionally misleading, as is demonstrated by the fact that the finest Mexican Vanilla contains only 1·70 per cent. Vanillin, Mauritius Vanilla, 2·75 per cent.; and yet the first is by far the most valued.

The explanation lies in the volatile oil which gives the special aroma, the products of Java and Bourbon being accompanied by another oil of pleasant odour.

The percentage of Vanillin varies from 1 to 2·75, with but few exceptions.

Vanilla is usually packed in air-tight tin boxes, in which it will retain its aroma for years.

The quality may be estimated from the following points of view —The longer and darker the pod, and the greater the quantity of crystals formed, so much the better are the goods. They should feel oily, and should emit a fresh, strong and pleasant odour.

The pods in a box should be equal in length, not broken or in any way damaged

It must be preserved in air-tight vessels, as the aroma rapidly volatilises.

These conditions are not always complied with in the retail trade; one result thereof is a regretably frequent adulteration of old odourless Vanilla with benzoic oil, which is said to restore the odour and oil of almonds to give the suppleness.

The most hardened deceivers go so far as to strew Vanilla with salt to imitate the Vanillin crystals.

A product of the plant, unknown in Europe, but prized in South America, is a juice which trickles from the fully ripe fruit, and is caught in vessels hung beneath.

REPORT OF THE HONORARY ENTOMOLOGIST, CEYLON.

ENEMIES OF THE TEA BUSH, AND OTHER PESTS.

Mr. Green has done an immense amount of work during the year. From his full report we make the following extracts:—

Owing to the drought up-country in the early months of the year and to the comparative failure of the south-west monsoon, there has been a marked increase in damage from insect pests of all kinds during 1898. Numerous complaints have been received of widespread injury from various insects that have hitherto attracted little attention. The more important insects of the year are noticed below.

Orthezia insignis, Dougl. (the lantana bug).—Considerable attention was drawn to this insect by its rapid increase throughout the Kandy district and along the railway. Besides the unsightly effect of the unhealthy and blackened vegetation, it was feared that the pest might spread on to the tea. That such fears were not altogether groundless was proved by the receipt from the Rangalla district of tea shoots thickly infested with *Orthezia*. Two small fields surrounded by chena scrub and native gardens were said to be attacked; but it is hoped that the strong measures taken have successfully checked its further extension on the tea. Fortunately tea does not appear to be a congenial food-plant, and so far has only been attacked where the bug has been crowded off the lantana or other infested shrubs. The danger lies in the possibility of the insect acquiring a taste for the tea plant when it has once obtained a foothold there. On this account it is strongly advised that wide boundaries should be cleared back wherever lantana scrub or chena impinges upon tea fields in infected districts. It is most desirable, too, that measures should be taken to check the extension of the pest in waste lands. This is best effected by firing the scrub twice a year, if it can be safely done. At present the pest is principally confined within a radius of twenty miles round Kandy; but, if unchecked, it may be expected to range over the whole Island within the next few years. A full account of its life-history, with recommendations for its treatment, is now in the press as the next "circular" to be issued.

Helopeltis Antonii.—The so-called mosquito blight has been very prevalent in some of the low-country districts (Kelani Valley, Kalutara, Udagama), resulting in a great falling-off of tea crop on affected estates. A visit was made to two of the infected districts and the local conditions investigated. When the pest is at its height, during the later months of the year, there is an almost complete loss of leaf on badly-attacked fields. The insects are present in enormous numbers. Children employed to catch them were, on one estate, bringing in from 200 to 400 insects each per day without producing any apparent decrease in the number. This pest seems an exception to the rule that dry weather favours the spread of insect pests. During the dry months of January, February and March the blight is practically non-existent. The insects commence to re-appear with the April rains, and rapidly increase. This is the time to attack the pest. Every effort should be made to kill these surviors before they have had time to propagate. The eggs are laid in the young tea shoots, almost invariably at some point above the "initial leaf." The young insect emerges in 10 to 12 days' time. It follows, therefore, that a rigid system of plucking close down to the initial leaf at intervals of 8 to 9 days, and the burning of the plucked shoots, must result in the destruction of a very large proportion of the eggs, and must tend to greatly check the increase of the pest. Our knowledge of the life cycle of *Helopeltis* is not yet complete, and will be made the subject of future investigations. Nothing is yet definitely known of the habits of the insects during the resting season. It is supposed that most of them die off as soon as the dry season approaches. A certain proportion, however, must hibernate and re-appear in the spring, or resting eggs may be deposited and remain unhatched for several months. The determination of this point is most important.

Several other plant-sucking *Hemiptera* have been sent to me as attacking tea. They are brought in by the coolies employed to catch the *Helopeltis*. Considerable doubt exists as to the actual damage done by them. The commonest, and one somewhat closely allied to *Helopeltis*, is *Capsus rama*, (Kirby) a greenish insect with transparent wings. It is often present in very large numbers on the blighted tea, and it imbeds its eggs in the young shoots in a similar manner to the *Helopeltis;* but when kept in captivity no punctures were observed upon the tea shoots included with the insects.

The Shot-hole Borer, Xyleborus fornicatus, (Eichoff) has been the subject of much correspondence throughout the year. Reports of injury to tea plants by this insect have been received from Watagoda, Nawalapitiya, Dolosbage, Kandy, and Deltota districts. Its presence is noticeable chiefly at the time of pruning, when the cut surfaces of the affected stems look as if riddled by small shot. On following out these holes they are found to ramify down through the stems, and contain numerous dark-brown beetles and their whitish, maggot-like larvæ. This beetle (admirably figured in "Indian Museum Notes," iv., 2) belongs to the family *Scolytidæ*. The insects of this family mostly attack dead or dying wood; but in the present instance they attack trees that are to all appearance perfectly healthy. Attack does not usualy result in the death of the tree, nor in freegrowing bushes does it produce any very marked result. The presence of these numerous galleries, however, must tend to produce decay by admitting water and other insects; infected trees also may very likely feel the effect of drought sooner. and this will mean a loss of flush. It is said that these insects cultivate a food fungus in their galleries (Hubbard, U S. Dept. of Agr. Div of Ent. Bull. 7) as is done by the termites and some ants. The burning of prunings in affected fields will help to check the pest; and the cut surfaces of the stems may be painted with some such greasy mixture as "Raupenleim," which will suffocate many of the insects in their galleries.

Numerous reports have been received of extensive defoliation of tea plants by the caterpillars of *Heterusia cingala*, (Moore.) They are said to appear in thousands, and to eat every leaf off the trees. It should be clearly understood that all these excessive plagues of caterpillars are preceded by smaller broods which, from their affecting perhaps one or two bushes only, are overlooked or considered to be of no importance. If this early brood had been promptly destroyed, the later extensive injury would have been avoided.

The caterpillar of *Heterusia cingala* is a fleshy-looking insect of a dull brick-red colour, about an inch long, broad, and thick-set. The back and sides are set with small conical tubercles with a few short inconspicuous hairs. When full-grown it spins a compact straw-coloured cocoon in a folded leaf, and in from two to three weeks emerges as a bright-coloured moth that might be readily mistaken for a butterfly. The moth has a wing expanse of $2\frac{1}{4}$ inches. The forewings are dark metallic, blackish-green, with an irregular white band and some whitish spots. The hind wings are black, with a broad primrose yellow zone across the middle, the black parts veined with metallic blue. The extremity and base of the abdomen are rich peacock blue, the median are a bright yellow. Some moths kept under observation shed their small oblong yellowish eggs loose on the bottom of the box in which they were confined. But as the moth has a prominent ovipositor, it is probable that under natural conditions the eggs would be deposited either in crevices of the ground or of the bark of the trees. *Heterusia cingala* is an indigenous species peculiar to Ceylon. Its caterpillar is subject to the attacks of a parasitic fly, *Exorista heterusiæ*, belonging to the family *Tachinidæ*, which fortunately checks any very extensive increase of the pest. Of over 100 caterpillars sent to me from one estate scarcely 10 produced moths, the balance having been destroyed by these flies The collection and destruction of the caterpillars by hand is the only practical treatment. A very badly-affected field might be pruned down and the prunings burnt upon the spot.

Other leaf-feeding caterpillars of the tea plant that have been prominent during the year are—

Orygia postica (Wlk.), a small hairy caterpillar with brush-like tufts, projecting forwards on each side of the head, similar tuft on the tail, two shorter tufts on each side, and four very compact tufts on the back. The female moth is wingless—merely a bag of eggs which she deposits on the surface of her cocoon. The male moth is a sober-coloured insect with brown wings marbled in darker shades. As all the eggs—and they are very numerous—are deposited on one spot, the resulting brood of caterpillars is at first confined to one bush. This is the time to attack them, and they can easily be exterminated before they have wandered further afield and started fresh broods.

The Tea Tortrix, *Homous fasciculina*,(Wlk.)—This insect is always present to a small extent on the tea. The larvæ is a small greenish

caterpillar that spins a few leaves together and feeds within them. Under ordinary circumstances it does no appreciable harm, but occasionally it unaccountably increases and makes itself obnoxiously conspicuous by spoiling the whole flush over acres of tea. The outbreak is usually of short duration, seldom extending beyond the period of one flush. In every instance that has come under my observation the sudden increase of the pest is as suddenly checked by an epidemic of a fungus disease that practically exterminates the caterpillars. The moth of this caterpillar is a small fawn-coloured insect, which when at rest is rendered very inconspicuous by its resemblance to the fallen bract of a plant.

The leaf roller, *Gracilaria theivora*, (Wlsm) is a very minute moth with a correspondingly minute caterpillar. Its small size may be realized from the fact that during the first half of its existence it lives and feeds quite comfortably as a miner between the two surfaces of a young tea leaf. Later, it twists up a leaf into a purse-like receptacle in which it completes its growth. This insect is common, and is usually of no economic importance. This year, for the first time, I have had reports of considerable injury caused by it. It increased to an extraordinary extent in the early months of the year. This was no doubt due partly to the prolonged drought. During the rainy weather the leafy receptacles formed by the caterpillars become filled with water and their inhabitants drowned. The collection and destruction of the doubled-up leaves in which the caterpillars reside is the only practical treatment. If the pluckers were instructed always to remove such leaves, there would be little fear of any sudden increase of the pest.

The yellow tea-mite, *Tarsonymus sp.*, has also shown unusual activity this year. This species is very commonly present on individual trees; but in September and October, probably owing to the failure of the south-west monsoon, complaints were numerous of extensive blights caused by this mite. The animal itself is microscopically small. It affects the young leaves only, differing in this respect from the other tea mites, such as "red spider," which confine themselves to the mature leaves. The symptoms of the blight are a hardening of the young leaves, with a brownish scaly appearance on the under surface, especially on each side of the midrib, with, very often, the semblance of a supplementary rib on each side of the true one. The shoots become hard and small, and eventually the bush stops flushing. Leaves that have been attacked never fully recover, but always bear a roughened pitted look. The mites are always found on the newest growth, moving upwards as the leaves get older. Close plucking is therefore a logical mode of treatment, and in the event of bad attacks spraying can be resorted to. Many other species of *Tarsonymus* are destructive pests in other countries.

Specimens of a large termite of an undetermined species, but quite distinct from the ordinary "white ant," have been received from various districts (Watagoda, Madulkele, Nawalapitiya) and reported as damaging living tea bushes. The insects make their entrance through the taproot, and completely hollow out the main stems. The tree survives for some time, so that the injury is not observed till too late, and suddenly collapses when dry weather sets in. The damage done is reported to be very considerable. Until the life-history of this particular species has been worked out it will be difficult to suggest any radical cure. Nothing is known of the nesting habits of the insect. As the termites probably travel for long distances underground, they are difficult to follow up. If the nest could be found and destroyed, the pest could soon be got under. A case of serious damage to tea seedlings by *Nematode* worms has been brought to my notice. The worms were said to have partially destroyed a good nursery of plants by eating off all the fine roots together with the bark of the taproot and young stems. The plants blacken and die off, and when pulled up are found to be entirely devoid of roots. I found the remains of the taproot and the cotyledons to be swarming with the young thread-worms. If this disease should become prevalent it would be very difficult to raise seedling plants. Whenever signs of the worms appear the ground should be treated with one of the alkaline manures, *e.g.*, nitrate of soda or of potash, preferably the former. These keep away worms and similar pests and are beneficial to the plants. Diseased seedlings should not be planted out.

The question of quarantining and fumigating imported plants and fruits has been under consideration, and experiments have been made with a view of determining the best methods of treatment for such cases. The risk of importing dangerous scale and other insects is considerable; the green bug of coffee and the lantana bug are both importations. Satisfactory results have been obtained by fumigation with hydrocyanic acid gas; and by the use of the gas in a more concentrated condition than usual in such work, and for a shorter period, the injury caused to delicate plants has been avoided.

Introduction of Beneficial Insects.—A consignment of lady-bird beetles of the species *Exochomus nigromaculatus* has been received through the kindness of Mr. C. P. Lounsbury, Government Entomologist, Cape Colony. To avoid unnecessary delay the box was sent by post, taking four weeks in transit. Only five beetles and four larvæ (evidently born during the journey) were found alive when the package reached me. The rest were dead, perhaps owing to having been captured when adult. The insects were carefully packed in moss, with a supply of food in the shape of cochineal insects, which being restricted to the prickly-pear were not liable to become a pest here. The surviving beetles were transferrred to glass jars, and provided with local scale insects as food (*Pulvinaria psidii*, *Dactylopius citri*, and *Lecanium viride*, the green bug), upon which they commenced to feed freely. They were also tried with *Orthezia*, but steadily refused it. They have since been fed exclusively on green bug, upon which they have thrived very well, and have produced young ones, which have been reared to maturity upon the same food. I consider the result of the experiment to be most encouraging, as proving the possibility of obtaining living beetles without the great expense and equal uncertainty of sending a special commissioner for their collection and transport. By securing a brood of beetles immediately after their arrival at the adult state, or while still in the pupal stage, the chance of their surviving the journey will be greater. Repeated small consignments would be more certain than a few large ones. The few survivors from the Cape consignment have now more than quadrupled their number, and fresh larvæ are appearing daily. When sufficient have been obtained, specimens will be distributed for liberation in the coffee districts, but it is important to keep a good stock for breeding purposes. There has unfortunately been considerable loss owing to the cannibal propensities of the insects. I now find it advisable to have small jars with a limited number in each, and to provide plenty of cover in the shape of dead leaves or moss into which the insects can retreat when moulting, at which period they are most liable to the attacks of their neighbours. Adult beetles and larvæ must not be kept together, for the same reason. The eggs are concealed among the rubbish, and the larvæ also conceal themselves, so that when it is necessary to clean out a jar, the rubbish must be kept under observation for a month, during which time many larvæ will make their appearance.

An exchange consignment of local lady-birds (*Chilochorus circumdatus*) was despatched by post to the Cape, but being delayed on the way, and not arriving for six weeks, the insects were all dead on arrival.

In a recent letter to the United Planters' Association of South India Mr. Lounsbury wisely cautions the planters not to expect too much from the colonization of foreign lady-birds, &c., pointing out that even when the introduction has been successful, local circumstances may tend to minimise the result. Climatic influences may be unsuitable. We are still quite in the experimental stage of the work, and must expect many failures, but the possible benefit is worth the cost of repeated failures. The work of Mr. Koebele in California and Hawaii shows what may be done in this direction. When we have to deal with large areas, artificial treatment is usually impracticable, and we must fall back upon natural remedies.

COOLY RECRUITING IN CEYLON FOR SOUTH WYNAAD.

Mr. E. H. F. Day, an ex-Ceylon planter, writes from Meppadi to the *Times of Ceylon* under date 25th April:—

I have just seen the correspondence in your paper the 20th instant re the recruiting of Ceylon coolies for estates in Southern India.

Since December last I have had two Ceylon kanganies here, who were brought over by a conductor. They did not bring over Ceylon coolies with them, but have recruited about a hundred coolies from Trichinopoly. I have only about eight coolies on the place who have been in Ceylon, and these the kangany says he brought from their native villages.

My head kangany informs me that he hopes to put another 150 coolies with sub-kanganies on the place, within the next two months.

The system here is to give a kangany an advance, and make him sign a contract to keep so many coolies on the place for a specified length of time. If he fails to fulfil this contract, he is liable for three months' imprisonment. I have questioned my kangany as to whether any of his new coolies are coming from Ceylon, and he says that some will come from there and some from their native villages.

I have told the kangany that he will have to produce *tundus* for all the Ceylon coolies he brings before they are given work on the estate. It will, however, be very difficult for me to ascertain which are Ceylon coolies and which are not. Consequently, it will be advisable for Ceylon Superintendents, who find their coolies are bolting without paying their debts, to send me full particulars, and I will then do my best to help them if I find the coolies are on this estate.

I may mention that the rates of pay here are as follow:—Men 5 annas, women 3½ annas, children 1½ to 3 annas. Head kangany 5 per cent. commission, sub-kangany 10 per cent. commission. Rice is R3 per bushel on the estate, and I make my kangany sign a contract to bring one cooly for every R20 advance that I give him. I recover one month's pay in every three against advances.

The reasons my kangany gives for being able to get a lot of Ceylon coolies at these rates—which are lower than Ceylon rates are—(1) that rice is cheaper here than in Ceylon; (2) that coolies here can get six days' work a week if they want it, whereas in Ceylon they can only sometimes get three.

P S.—The advance of R20 includes rail-fare, so that only sub-kanganies with small advances would be able to come here, as rail-fare from Ceylon amounts to close upon R10.

TEA, &c., COMPANIES.

The Poonagalla Valley Ceylon Co., Ld., declares a dividend of 4 per cent. against 3 per cent. last year.

The Ragalla Tea Estates, Ld., declares no dividend.

The Udabage Company, Ld.—215 acres tea in full bearing, 84 partial, 200 new clearings, 641 reserve. The crop secured amounted to 115,515 lbs. made tea realizing Rs.35,718·94, or an average price of 30·92 cents. per lb., as against an expenditure of (excluding item under Capital Account) Rs.30,539·71, or an average cost of cents 26·43 per lb. The balance at credit of Profit and Loss Account is Rs.6,380·65, including Rs.4,466·01 brought forward from 1897. Estimate for the current season 145,000 lbs. made tea.

General (Ceylon) Tea Estates, Ld.—The actual crop of tea gathered was 1,935,745 lbs, costing 29·72 cents f.o.b., which, at an exchange of 1*s.* 4 5-32*d.* was 4 4-5*d.* per lb, and to which must be added 97 cents of a penny for marine freight, warehousing and London charges, bringing the total cost for the tea sold in London to nearly 5 4-5*d.* per lb. The coffee crop turned out 3,369 bushels, costing f.o.b. in Colombo Rs.23,141·21 and netting in London £3,018 7*s.* 9*d.* Cocoa crop 132 cwts., costing f.o.b in Colombo Rs.4,612·07. Estimate—Tea 2,3·5,300 lbs. to cost Rs.26·57 f.o.b. Bought green leaf and leaf manufactured for others 181,000 lbs. Coffee crop 4,000 bushels, to cost f.o.b. Rs.26,187. Cocoa 150 cwt. Rs.6,207, besides whatever may be got for tea seed or plant sold.

Penawal Tea Company, Ld.—Dividend of 4 per cent. for the year declared.

Teesta Valley Tea Company, Ld.—Crop 2,243 maunds 10 seers. Revenue—By sales of tea amounts to Rs.84,352-1 2, or equal to 7·53 annas per lb; 71,625 lbs. were sold in Calcutta at an average of 8·02 annas, and 107,635 lbs. were shipped direct to London, and sold there at the equivalent of 7 annas per lb. The result of the direct shipments was a surplus of about Rs 300 on the Calcutta valuations at which they were invoiced; Rs.6,944-9-9 was realized by sales of cinchona bark, and with Rs.1,241-14-3 received for rents and other miscellaneous items, brought the total revenue up to Rs.92,538-9-2. After writing off Rs.4,394-13-1 on new cultivation, buildings and machinery, and providing for the manager's commission, the sum of Rs.18,475-5-1 represents the actual profit on the year's working; including *ad interim* dividend declared last October, 7 per cent. paid for the year. Estimate 2,200 maunds at a local cost of Rs.54,560, and an expenditure of Rs.1,440 on the upkeep of new cultivation. Calcutta expenditure should not exceed Rs.15,000.

Runghe Runghot Tea Co., Ld.—The outturn of the season was 70 335 lbs. of tea, profit Rs.12,331-1-3.

Phoolbarrve Tea Co., Ld.—Outturn 350,760 lbs., average 4as. 7p.

Ambuckie Tea Co., Ld.—Outturn 3,800 maunds, 2,966 maunds sold in Calcutta at an average of 8 as. per lb. and 808 in London at an average of 9·85d. Profit Rs.7,761-1-8. Estimate 4,000 maunds.

Sapakati Tea Co., Ld.—Outturn 824 maunds; average as.6-6. Loss Rs.3,705-11-5. Estimate 1,600 maunds fine tea.

Phœnix Tea Co. (of Cachar), Ld.—Outturn 4,748 maunds. Loss Rs.33,557-8-8. Estimate 448,000 lbs., to cost as. 3-5 locally, and as. 4-11 laid down.

Killing Valley Tea Association, Ld.—Crop 1,978 maunds, average as. 6-7p.

THE INDIAN CURRENCY COMMITTEE.

The following is the evidence of Mr. W. J. Thompson, Senior, and Mr. W. J. Thompson, Junior—the Mincing Lane brokers:—

Mr. William James Thompson, senior, and Mr. William James Thompson, junior, were called and examined.

8585. Chairman (to Mr. Thompson, senior) You and your son are the members of a well-known Mincing Lane firm?—Yes.

8586. You have been a tea-broker in Mincing Lane for how many years?—Sixty-seven years.

8587. For many years you have been Chairman of the National Discount Company?—Yes.

8588. (To Mr. Thompson, junior). You have been in partnership with your father for the last thirty years?—Yes.

8589. And you are both very familiar with all questions affecting the tea industry?—We ought to be.

8590. What has been your connection with the tea industry?—As brokers—simply to take the tea entrusted to us for sale in the London market, and to do the best for merchants.

THE DECLINE IN CHINAS.

8591. Can you give us the statistics of the approximate average prices of teas in London since 1884?—Yes. I have prepared the following table:—

APPROXIMATE AVERAGE PRICES OF TEAS IN LONDON.

Season.	Indian.	Ceylon.	China.
	s. d.	s. d.	d.
1883-4	1 1½	1 3½	11
1884-5	1 1	1 3	11
1885-6	1 1½	1 3	10½
1886-7	1 0	1 1	10
1887-8	0 11½	1 0½	9½
1888-9	0 10¼	0 11	9
1899-90	0 10½	0 11	9
1890-1	0 11	0 11	9½
1891-2	0 10	0 9½	9
1892-3	0 11	0 9	8½
1893-4	0 9½	0 8½	8
1894-5	0 10¼	0 8½	7¾
1895-6	0 9¼	0 8	7½
1896-7	0 9½	0 7¾	7
1897-8	0 9	0 7½	6

8592. During all those years, from 1883-84 to this time, China tea has always been the cheapest?—Oh, yes, in price.

8593. Have the imports into this country from India and Ceylon and from China been proceeding upon a regular ratio, or has there been a great increase in the one and a decrease in the other?—There has been an increase in the one and a decrease in the other.

8594. An increase from India and Ceylon and a decrease from China?—Yes.

8595 How do you explain that the cheapest article should have been the one that has decreased in quantity?—Because India and Ceylon offer you so very much better tea of the same kind than China.

8596. Therefore, you had a better market, although at a higher price?—But, really, India and Ceylon teas are cheaper than China teas because they go farther. You, yourself, well know that you do not require to put so much tea into your pot

8597. Do you think the general body of people who are the consumers of tea take that into account?—Well, I do not know—perhaps they make it too strong.

THE LAWS OF SUPPLY AND DEMAND.

8598. Can you tell us what the circumstances are that have caused this change of price? Supply and demand, in which I agree with the evidence already given by Sir James Mackay and others.

8599. The supply has exceeded the demand?—It has in one sense, because we used in former years to have a bigger stock; it used to be necessary to keep a bigger stock, because the China teas arrive here only during a few months of the year, whereas now every week a large Ceylon sale is held, and for nine months in the year there are Indian sales, so that we never have a shortage of supply. Buyers prefer now going from hand to mouth, and if the Indian and Ceylon supply is short, they prefer being squeezed rather than have to keep large stocks. And we must remember that tea does not keep. You cannot keep your tea for a year or even for six months; it is not as good as it was when it first came in—therefore, it is desirable for that and for many other reasons to keep on selling your tea as it arrives. That is the practice of the London market.

THE MARKETS FOR TEA.

8600. Can you give us an opinion as to the markets for tea other than the English market?—As to the other markets for tea, one is India itself, but that is merely a nominal market, because the Indian native does not drink tea in the same way as the Chinaman does.

8601. But the India native surely prefers Indian tea?—Such tea as he drinks, yes.

8602. India does not import any tea from China?—Practically, no. (Sir D. Barbour). They do import a little.

(The Witness). There is a little imported *en route* for Persia and Central Asia, but it is an exceedingly small quantity. Then, if you take Australasia, there you may say that British-grown tea has practically conquered the market. There has been a very rapid development on the lines of the home trade; it is now about 20 millions a year.

THE STRUGGLE IN AMERICA.

8603. (Chairman). Perhaps you will put those figures in?—Yes, I will include the figures. Then we come to the United States and Canada. Our trade there is gradually increasing, but very slowly indeed—it may be now some 12 millions a year.

8604. Do you say that Indian tea is increasing in that market?—Only slowly—very slowly. I am sorry to say that China and Japan have practically the whole of the United State consumption. It is a totally different tea to the Indian or Ceylon tea. Instead of black tea, it is green, or "uncoloured," and of a peculiar flavour. Perhaps it is a matter of taste, perhaps it is a matter of their water, but anyhow the Americans prefer the China and Japan tea. I may say that the London dealers, who do business in the country districts in England, such as Liverpool, Birmingham, and so on, have casks of water from the different towns sent to them to their London offices in order to taste the tea made in that water in order to select the samples best suited to the district. It is only fair to say that the Indian and Ceylon planters have done their very best to push the tea in the American and Canadian markets, by putting a voluntary cess upon themselves, amounting to many thousands a year, and by advertisements, and even by giving away their tea and sending special agents over to sell it; and, besides that, the London dealers doing the export trade have done the same thing. Yet they have not succeeded in getting hold of the American market; they have not laid hold of the American taste.

8605. Is that true of all the States?—The whole of America generally. I will give you here the figures that I got from the United States Consulate, on purpose for this Committee, of the teas imported into the United States of America, taking it for 1897 as being the last year. There were 56 million lbs. from China, 45½ million lbs. from Japan, and only 2 million lbs. from British India; that is to say, imported direct. A little more goes from us.

8606. Is there any duty in America upon tea?—Yes.

8607. It is the same duty for all tea?—No; there is an extra duty of 10 per cent. if it is an indirect import, otherwise there is no difference; all the tea duties are absolute.

PROGRESS IN RUSSIA.

8608. (Sir J. Muir). There was an extra 10 per cent. put on for the war?—I think so. Then there is another market—continental Europe, principally Russia In that market they consume the same class of tea from China as we get from India and Ceylon, namely, black teas, and, therefore, we are on a better footing there, and the trade with Russia is increasing, I am glad to say, very considerably. This year, again, it is larger than last year.

8609. (Chairman). Is that in India and Ceylon teas?—Yes, both. I mean the trade from the London market. I should say that the Russians are an exceedingly conservative people. At one time, even the fact that the Indian tea was done up in different packages from those that they had been used to from China militated against it; but now they have found out that really our teas are worth their attention, and we get large orders from Russia for Indian and Ceylon teas of all growths.

THE HOME CONSUMPTION.

8610. In this country Indian and Ceylon teas, of course, have a good market?—Yes, and our home consumption is increasing every year? It is increasing, you may say, *pari passu* with the population.

OVER-PRODUCTION AND ITS RESULTS.

8611. Do you think that in recent years there has been an excess of production in India or Ceylon?—There has been quite enough; 5 per cent. less would have given you 10 per cent. more for your teas.

8612. Do you think the lowering of the price has rather arisen from an excess of supply?—We have had rather too much, and we also find that we can do with less stocks than we used to, which is a very important factor.

8613. Do you think the supply of Indian and Ceylon teas will increase or not?—I think so, undoubtedly, but it will not increase so rapidly as hitherto.

8614. How is it affected by the present rate of exchange?—Is that a fair question to put to a Mincing Lane broker?

8615. I will not ask you if you have not an opinion to express upon it?—I have an opinion, of course. It is affected. I am quite sure that, since the exchange has risen, many people have not been extending as they would have done.

8616. Then it is to that extent injurious to the trade?—It has affected it in that way, there is no doubt.

8617. According to your figures, it does not seem to have affected prices, but it would have raised the cost of production?—Yes.

8618. And, therefore, affected the profit and affected the growth of the trade, and possibly the investment of capital in that trade?—It has affected profit certainly, as we poor shareholders have found out.

8619. (To Mr. Thompson, senior). You agree with your son's evidence?—Yes.

A CHANGE IN TASTE.

8620. (Lord Balfour of Burleigh, to Mr. Thompson, junior.) I gather from you that the variation of these figures arises, in your opinion, from a change in taste of those who drink tea; they now prefer the Indian and Ceylon tea to the Chinese tea?—Certainly, and the Chineses have helped that by the quality of their teas deteriorating.

CHINAS AT A DISCOUNT.

8621. I suppose you say that the relative price of the two teas would be an important factor in determining the consumption. For example, if China tea can be put on the market at a less relative price than Indian tea, it would in the course of time let in the Chinese to compete again?—It would interfere certainly if they could undersell Indian and Ceylon teas, but it is fair to say that some of our biggest people in London will not use a pound of China tea because it spoils their blend. You know that practically all the tea that is sold in the United Kingdom is blended.

8622. Have you any opinion whether the difference in quality between the India and Ceylon tea and the China tea is intrinsic, or is on account of careless cultivation, or anything which the Chinese by improved methods could counteract?—It is certainly partially intrinsic, because the Indian and Ceylon tea is not the same as the China tea, it is an indigenous plant, growing wild in the jungles of Assam, and it is found to be superior to the China plant. We have certainly heard that a lot of new tea machinery has been sent to China, but so far we have had no results from that. Anyhow, they will never get from the Chinese plant such fine teas as are got from the Indian plant.

8623. Are you able to say whether any experiments have been made in China with the Indian plant?—I think not: they have made experiments in Java, and the result has been good.

8624. (Sir J. Muir.) You have some interest in tea companies as a shareholder?—Yes, a little.

THE LOSSES OF TEA COMPANIES AND THEIR CAUSE.

8625. And you are aware that the dividends paid by the tea companies this eeason have been materially less than they were last year and in previous years ?—Yes.

8626. Arising mainly from what cause?—Increased cost of production.

8627. One of the leading elements in that is the difference in exchange; that is to say, suppose your agents in Calcutta sell a 90 days' sight bill upon a London bank to lay down funds to pay the coolies wages, if they sell the bill at 1s. 4d. in the one case, whereas if the Government of India had not in this arbitrary way fixed the rate at 1s. 4d., they could have sold the bid at 1s. 2d., that would have made a considerable difference?—Yes.

8628. And probably have turned the loss on the last season into a profit?—It would have made a considerable difference, of course.

8629. What difference do you estimate there would be between a 1s. 4d. rate and a 1s. 2d. rate, on the wages of the coolies per pound of tea?—I believe it would amount to about $\frac{5}{8}$ ths of a penny per pound.

8630. That effect is felt very much more severely, is it not, in Ceylon than in India, because the entire industry of the Island of Ceylon now, since the coffee failed, is tea?—Yes, that is the great industry of the island.

8631. The great industry of the island hangs now upon tea?—Yes.

THE FUTURE OF CEYLON.

8632. Suppose the tea industry should fail, as coffee has failed, what becomes of the Island?—I will leave you to deal with that question, I do not like to think of it.

8633. How is the Government to carry on the administration of the Colony?—I am not the Governor.

8634. These are questions, I think, that it behoves us a little to look at. I hear the Ceylon tea planters putting questions of that nature, and I daresay you have heard the same?—Yes, but is it not a little hard to put the question to a poor tea-broker?

8635. You are a tea planter to a small extent, but you are not in the same position as some of the poor tea planters are?—No, and I never was in that position from the other point of view either.

SOME TRADE CURIOSITIES.

8636. (Sir F. Mowatt.) In the yearly prices which you gave us of the teas, I observe some curious variations. In 1892-93 I think you said that India was selling at 11d., Ceylon at 9d. and China at 8½d.?—Yes.

8637. The next year it fell to 9½d. in India, 8½d. in Ceylon, and 8d. in China?—Yes.

8638. The next year it rose again to 10¼d., 8½d., and there was a little fall in the case of China to 7¾d.?—Yes.

8639. Is there any explanation of that beyond the ordinary rates of supply and demand?—Probably not. We had one very fine year from Assam—a sort of climatic influence came over Assam, and gave us a very large quantity of high priced teas. I think that was the year when the price rose to 10¼d.

AN INCREASE OF BRITISH-GROWN TEAS POSSIBLE.

8640. On the whole, from your experience of the trade, do you anticipate that the supply of Indian and Ceylon teas will tend to increase?—Yes, I am certainly of that opinion.

8641. (Sir D. Barbour.) In the figures you gave of the prices, I noticed that, in the earlier years, Ceylon tea fetched a much higher price than Indian, and now it is lower. What is the explanation of that?—In the earlier years there was only a small quantity, and it was of finer quality than now—at first, too, it was a novelty.

8642. I think you said that there had been some over-production in recent years?—Well, there has been quite enough.

8643. You suggested that if there had been 5 per cent. less tea, the price would have been 10 per cent. higher?—Yes.

8644. So that the tea planters would have gained?—They would in that way; but it is impossible to stop production.

8645. But you suggest those figures—5 per cent. less tea would mean 10 per cent. more in price?—Yes, our stock is so small, that a reduction of 12 millions in it would cause an advance in price. That is what it would amount to.

8646. You also said that the rise of exchange would diminish the profits?—That is a *sequitur*, I think.

8647. And that would diminish, to some extent, the rate of production?—I think it would eventually have that effect. It has with some people, I know.

8648. According to your figures, if a rise in the rate of exchange caused a 5 per cent. reduction of production, there ought to be some gain to the planter from a rise in the London price?—That is so, taking these figures; but tea, as you know, takes five or six years before it is in full bearing. That is why you cannot stop porduction

8649. But the argument would be this: that a fall of exchange might so increase production as to lead to over-production, and be followed afterwards by a reaction?—Quite possibly.

8650. Whereas, if there was a steady exchange, you would, at any rate, get rid of one cause of fluctuation and uncertainty?—Yes.

8651. You said that the tea plant in India and Ceylon is altogether different from the tea plant in China?—Yes.

8652. And gave a better tea?—Yes.

8653. That also gives an advantage to the Indian and Ceylon planters?—Yes, but the first gardens in India were laid out with the China plant, and now nobody would dream of sowing the China plant.

8654. We know that China is an old country, and tea has been grown on the same land there for a large number of years, so that it is possible that the soil may become exhausted; whereas in Assam and the Dooars, you have virgin soil. That would make a difference. would it not?—I do not think so, because the origina. gardens where the China seed was planted were also on virgin soil.

8655. I do not say what the difference would amount to, but there would be that additional difference?—Of course, it is a newer soil undoubtedly.

8656. And, therefore, a better soil?—There is no doubt.

THE LONDON MARKET.

8657. (Sir A. Dent.) Are the prices you gave of the different teas just now the prices in the United Kingdom?—In the London market, yes.

8658. Then you are not including the large quantities of high-class teas that go straight from China to Russia?—No, this is only from the London market.

8659. If you included them in your figures, that would make the average for China very much higher?—Very much higher, because they take the bulk of the finer teas, and have done for many years, direct.

8660. You say the stock of tea in London now is very much less than it used to be?—Yes.

8661. I suppose it is brought about very largely, if not entirely by the fact of the Indian and Ceylon tea coming in week by week?—Yes.

8662. That, therefore, is a point in favour of Indian and Ceylon teas?—Well, I think, that is only a point of favour of the market remaining steady.

8663. I mean, people will not import China tea because they would have to hold it for such a long period before selling it?—That would be purely from a merchant's point of view, depending on the offers made for the tea from time to time.

8664. Of course, it would affect the merchant very much in considering the quantity of tea he should lay in stock?—Yes.

8665. Therefore, he will prefer to deal in Indian and Ceylon teas?—Yes.

CEYLON'S POSSIBILITIES AS A PRODUCING AGENCY.

8666. Can you form an opinion as to the possibility of large extensions in the tea-growing area in Ceylon? Though you say you are only a broker, we know how you watch tea-growing all over the world. It is the common belief, I think, in Ceylon that there is very little more land available there?—That is what I am told.

8667. You have personal experience of India. Are there large districts in India still available, in your opinion, for tea planting?—I think a very great deal.

8668. I think you said, in answer to Sir John Muir, that the dividends of the tea companies were very largely affected by the extra cost of production?—That is my experience as a shareholder.

8669. I think you might have added that the price here has gone down also?—Not very much.

8670. It is not solely the cost of production?—The price has fallen very little in the last two or three years—the average price. Individual prices may have fallen, but the average price has not changed much; it is 9½d., 9d., 8d., 8½d., and so on.

A CHINESE CURIOSITY.

8671. Do you think the Ceylon and Indian teagrowers have much to fear from the possibility of China tea being again imported in large quantities into this market?—I hope not.

8672. You hope not, but will you go beyond that?—I have never understood why China has not sent us more tea, considering the difference in exchange. I could never understand it; I sincerely hope they will not send us any more, but it is a possibility.

THE INCREASE IN PRODUCTION OF BRITISH-GROWN TEAS.

8673. (Mr Le Marchant.) What has been the rate of increase in the production of Indian and Ceylon tea in the last three years?—I can give you the exact figures for the last three years. The imports of Indian tea in 1895-96 were 118 millions; in 1896-97, 131½ millions; in 1897-98. 135½ millions; Ceylon tea in 1895 96, 82 millions; in 1896-97, 92 millions; and in 1897-98, 93 millions.

8674. There would be some fall in price corresponding to the increase from 118 to 135½ millions, would there not?—Yes, and there is a slight fall in price—not much. Then you have to take the fact that we received at the same time 10 millions less China tea between the two years; we should have less China tea, and more Indian and Ceylon tea.

8675. On the other hand, India and Ceylon would go further in use?—They ought to do. Obviously, we do not want them to. They do, as a matter of fact, go further, because they make so much stronger a tea.

8676. Would you attribute that increase of production to the favourable rate of profit that was existing previously?—There were signs, many years ago, that Indian and Ceylon tea would be the favourite. A garden takes five years before it begins to bear properly.

8677. Would the increase of the output be likely to follow any advantage in the way of cheapened production; would the tendency be for the supply to grow up to the limit of profit?—I suppose that is so in the case of every article. It does not matter what the article is, it would be governed by the same law.

8678. So that any special advantage in the way of a low exchange would tend to be counteracted, so far as profit goes, by the increase in production?—In the course of time, in tea, perhaps so. I should like to put in some figures that we are publishing in our circular to-day as regards the external markets.

(Chairman.) Any tables you like to add to your evidence we will put in the Appendix. The Witness withdrew.

WEEDS.

The Canadian Journal, *Farming*, as quoted in the *Agricultural Journal of the Cape of Good Hope*, in a recent number, contains a paper on this subject by the Professor of Biology and Entomology, which may be interesting, and the study of weeds and weed-seeds as recommended may be found very helpful in fighting these enemies of crops:—

"An authority has stated that weeds have been a blessing to the farmer and gardener.

Very few will care to acknowledge off-hand the truth of this statement, yet, when we look into the matter carefully, much can be said in its favour. The continuous warfare that every tiller of land must wage in his efforts to control or exterminate the weeds keeps the surface-soil in better condition to withstand drought. The gardener must hoe, the farmer must plough, harrow and hoe, else his foes, the weeds, would soon get the upperhand and strangle the crop.

It is a well-known fact that any loosening of the surface-soil has the effect of conserving the moisture. The study of physics also reveals the fact that water rises in fine tubes or pores above the level of the water outside the tube, and that the smaller or finer the tubes the greater is this difference of level. When a gardener works the soil the pores are made larger, for the particles are made less compact than before, hence the subsoil water does not rise so high, and evaporation is not so rapid

During seasons of drought this simple act of loosening the soil with a hoe and rake plays a very important part Weeds compel this simple act, and hence are beneficial in this respect.

On the other hand, weeds, like other plants, require water, which is imbibed by the roots, and carried to the leaves. The great bulk of this water, which has acted as a vehicle for the transportation of salts from the soil to the laboratory of the plant—the leaves—is again transferred, or evaporated into the air and hence lost to the soil. It can be readily seen how very important is this question of weeds in a dry season, when the subsoil-water requires to be looked after and conserved.

Again, weeds, like other plants, require nourishment, and, when they are allowed to grow, the salts, which should be absorbed by the crop, are taken up by the weeds. This piracy on the part of weeds can be stopped only on the death of the weeds.

Most farmers are able to recognise weeds. They can tell when one plant is interfering with the proper growth of some other plant which is of greater economic importance. A weed has been cleverly defined as a 'plant growing out of place.' Nearly any plant may become a weed, but only a few hundred out of many thousand become weeds of any economic importance According to the definition given above, weeds would include the lower plants, such as smuts, mildews, rots and moulds; but, popularly, weeds are looked upon as plants of considerable size, and the microscopic species are not considered.

A knowledge of the habits of weeds is the first essential in a scheme for their eradication. For example, the following habits should be thoroughly studied:—

1. Is the weed an annual, biennial, or perennial? If the weed is annual, destroy it before it seeds.

2. Is its seeding capacity great or small?

3. How are its seeds disseminated or distributed — wind, water, or by animals? Many a farmer finds his fields full of thistles through the carelessness of a neighbour, who neglects to cut his thistles before they seed.

4. Is its root-system extensive? The thistle propagates itself by its extensive root-system. The common bind-weed has an enormous system of roots, which is almost impossible to eradicate. Kill the weed when it is young, before it becomes deeply rooted.

5. Is the weed a parasite? The dodder fixes itself to the clover-stem, and imbibes food from it through roots which it sends into the plant. The only remedy in this case is to destroy the clover crop, and to be extremely careful in the selection of clover seed.

Farmers must insist on pure seed, if they wish to keep a check on weeds.

A knowledge of weed-seeds is nowadays necessary to the successful farmer.

The botanical section of the Experimental Union is now making up sets of weed-seeds, which will be distributed in due time to those who are interested in weed eradication.

STRAY NOTES ON MANURES.

A complete Compost.—Mr. C. J. Prowse, Massachusetts, writes to the *American Agriculturist*:—

First, put down a layer of vegetable matter, such as barnyard manure, night soil, hen manure, refuse from the vegetable and fruit piles, scrapings from the woodpile, rubbish from the garden, in fact anything and everything in the shape of litter. Make the layer 10 ft wide by 20 ft. long, and six inches deep. Over this sprinkle 15 lbs. potash, dissolved in five or six gallons of water, which will turn it into a jelly. Then over this scatter evenly one or two barrels of unslaked lime and cover the whole evenly with 2 in. of fine earth; the finer the better. Repeat this as often as you have enough matter to make a layer, as above described.

When the pile is three to four feet high, put on enough water to slake the lime, and thoroughly saturate the whole mixture, but not enough to wash or leach it, as that would carry away the best of the fertilizer. The water will cause the potash and lime to produce a powerful heat, and a very sudden decomposition of all vegetable matter. This amount of material will make one load of fertilizer worth three or four of common barnyard manure. Besides it will come out as fine as ashes, and consequently be very easily handled. The compost can be made without potash and lime, but not without the water. It will not be as rich in plant food without the lime and potash, nor nearly as well balanced chemically. The potash may be obtained from the crude potash, or two barrels of good hard wood ashes evenly spread over each layer, instead of the 15 lbs. of potash, will be just as good. It is one of the best and cheapest fertilizers I can get. Anything and everything can be put into it, even to a dead horse, ox, horns, hoofs, old rags and the scrapings from the woodpile, simply by adding more potash to the last named matters, and it will all be converted into a splendid fertilizer.

The wash suds and the slops from the chambers should be saved for wetting down the pile, or can be thrown on as made, as they

will increase the value of the manure. The liquid manure from the stable should not be allowed to go to waste, but all put into the compost heap, so that nothing be lost.

Applying Manures.—Mr. L. H. Read, Wisconsin, writes:—

Although there may be some cases where the land is very level and where circumstances are such that the only way to manure may be during the winter, such instances in my opinion are very rare. My experience has covered many different kinds of soil and in different states. I have known of many cases where large coats of manure ploughed under in a careless manner were, during dry seasons, a detriment to the crop, but when the work was properly done I never knew of any harm coming from the practice. The main reason why manure should be put into the soil and thoroughly mixed with it, is that it adds all the humus directly to the land.

The principle applies as well to sandy or gravelly soils as to clay, and in fact my last six years' experience has been with the light, sandy soils of central Wisconsin, and I would venture to say that there is a loss of 20 per cent. of the value of eight out of every ten loads of manure ever spread upon frozen ground, unless the land be an absolute dead level. The best farmers keep their manure either in manure cellars under their barns or in sheds built especially for the purpose of protecting this most valuable of farm products. If for any reason it is impossible to spread manure in the spring, keep it under cover and apply in the fall, plowing under when damp, if possible, as the decomposition will commence at once. The surface of soil begins to thaw out first, and if covered with manure, and thawing, whether it commences with rains, the manure may thaw out and half its value be washed away before the land becomes thawed enough to absorb the dissolved fertility.

Value of Wood Ashes.—Mr. Jasper T. Jennings, of Pennsylvania, remarks:—It would probably be hard to find a commercial fertilizer of much greater worth for dry upland soil than pure and simple unleached hardwood ashes. A bushel of this home fertilizer is worth more than a bushel of oats to any farmer, and yet how often do we see it dumped as a heap of worthless refuse to leach in the rains and part with its hidden value until it becomes worthless.

Our lands as a general thing have become deficient in potash. This is one of the main sources of fertility that have become exhausted. It is good for corn, it is good for wheat, it is good for potatoes, and clover cannot thrive without it. Try a little experiment next spring. You who burn wood this winter, store your ashes where they will keep dry, and sow them on your young clover as you would plaster. You will be agreeably astonished at the result. You will find many dollars added to your product. Nor is the effect gone with the first crop, as is often the case with commercial fertilizers. It lasts for years, and its benefits are often extended to many succeeding crops.

Green Manuring and Nitrogen.—Prof. W. P. Brooks, Massachusetts, writes:—The nitrogen of the soil is the only one of its valuable constituents which is subject to serious loss by natural agencies. Whatever the form in which nitrogen is applied to the soil, whether in farm-yard manure, in dried blood, in ground fish, ground bone, tankage, cottonseed meal, sulphate of ammonia, or nitrate of soda, it sooner or later is so changed by natural agencies as to become soluble and in this form the soil cannot hold it. With heavy rains it is dissolved in the downward sinking water, and with it is carried ultimately into the streams and rivers and to the ocean.

None of the other valuable elements of plant-food are subject to this loss by leaching to anywhere near the same extent. This loss of nitrogen can be prevented in a large measure by the growth of green manuring crops. The agencies of nature which convert nitrogen into the soluble form are most active during the later summer months. At the close of summer there is commonly present in all fertile soils a large quantity of nitrogen in soluble form. If the field be left bare during the autumn, winter and early spring this soluble nitrogen will be washed out of the soil. The only pratical method of preventing this is to cover the field with a growing crop.

For this purpose those crops which grow late into the fall will be found best, although even those which are killed by autumnal frosts will before their death have taken a considerable share of this soluble nitrogen out of the soil. It will have become a part of the vegetable tissue. In such form it is not soluble and will not be subject to waste until this vegetable tissue rots, as it will do with the advance of the warmer weather of the following season. It should be the aim of the farmer to leave his fields bare just as little as possible. Keep the fields covered, keep the soil filled with feeding rootlets of growing plants. These hungry rootlets will take up nitrogen which would otherwise be lost. It will be locked up in vegetable tissues and safely kept to meet the demands of the growing crop of the next season. Green manuring, then, may be made an important means of saving or conserving soil nitrogen.

Effect of Lime on Acid Soils.—In some greenhouse tests at the Ala exp. sta., upland soils, sandy and deficient in humus, Savannah land, and light gray loam, usually too wet for cultivation, and the stiff, black soil from swampy hammocks were treated with lime. Lettuce planted on the first kind of land was a total failure. In the box containing the Savannah soil, lettuce on the limed portion was three times as large as that on the portion that received no lime. Radishes were hardly so good on the limed portion. On the hammock soil the lettuce was best on the limed end and there was apparently no difference with the radishes.

"THE GREEN HILLS."

A TALE OF LONG AGO.

The following extract, referred to in our last issue, was inadvertently omitted by the printers:—

To hand is an interesting official report of the Shevaroys drawn up for the Madras Government by Colonel Douglas Hamilton, of the 44th N. I., as long ago as 1862. Many of those who know that the Nilgiris are the "Blue Hills" are unaware, perhaps that the Shevaroys are the "Green Hills" and that coffee was introduced into the Shevaroys as far back as nearly eighty years ago, the first coffee-planter being Mr. Cockburn, of the Madras Civil Service, who tried his first experiments somewhere about 1823. In 1863 there were 5,101 acres of the Shevaroys planted with coffee, held by thirty Europeans and Natives; but the industry was reported to be barely remunerative, "owing to the difficulty of procuring "coolies at the proper season, and the carelessness and ignorance "of those entrusted with the plantations." Managers have improved, we may take it, both in knowledge and in carefulness since that scolding of forty years ago was given to them; but the labour difficulty, though conditions of getting recruits have improved, is an ever-present trouble. Labour on the Shevaroys was cheap thirty-six years ago—when it could be got—the usual hire of a coolie being two annas and four pies per diem. Somewhere about the year of the Mutiny, a few tea plants were introduced into the Shevaroys by Mr. Fisher, of Salem, and in the report of 1862 before us, it is said that they "have grown most luxuriantly, though "no care has been taken of them, nor has the manufacture of tea "from them been attempted." Life at Yercaud in that far-off time must have been rather dull. There were twenty dwelling houses, "of small dimensions, scattered over irregular undulating hills;" there was only one single family that was not in the planting line; and there were no bazaars and no vegetable gardens. It is interesting to note an agricultural dictum laid down by Col. Hamilton in his old-time report, in which he says:—"Capital laid "out in establishing a large fruit and vegetable garden to supply "the city of Madras would certainly prove more remunerative than "coffee planting." It is a question; but, any way, things have so far progressed that Yercaud of thirty-six years ago would scarcely know itself now.

AN ADVERTISER'S HISTORY OF COFFEE.

A Montreal firm lately gave as an advertisement a brief history of coffee, in three parts. This is at least a curiosity of literature, and we therefore reprint it in full:—

Although everyone is familiar with coffee as a beverage, comparatively few know the history of its origin, where it was first grown, when introduced, how cultivated and cured. Accounts differ as to when, where, and by whom, coffee was first introduced to civilization.

An eastern legend ascribes the discovery of the berry to a Dervish, who, in the year 1285, being driven out of Mocha, was induced in the extremity of hunger to roast the berries which grew near his hiding place. He ate them, and, steeping the roasted berries in water to quench his thirst, discovered their agreeable qualities. But a more authentic account states that it

was introduced into Arabia from Southern Abyssinia by a Mohammedan high priest about the year 1500.

We are indebted to the Persians for the discovery of the roasting process, and, as the merits of coffee as a beverage would have remained unknown without that, some authorities allow them the credit of being the introducers.

It continued its career through Syria, and, in the year 1554, we learn it became the favourite drink at Constantinople, and the Oriental coffee-houses were thronged night and day. The lower classes actually begged money with which to buy coffee, and it is stated that the refusing to supply a wife with coffee was admitted in law as a valid excuse for divorce.

Europeans are indebted to the Dutch for their first acquaintance with the coffee plant. This was brought about in the following manner: Some berries which had been procured were carried to the Island of Java and there planted. A specimen plant was sent home to Amsterdam in 1690 by Governor Wilson. This plant bore fruit, from which many young trees were propagated, and from this original most of the gardens of Europe and the East Indies are supposed to have been furnished.

In 1714 a plant was presented by the magistrates of Amsterdam to the French King Louis XIV.

This plant was carefully nursed, and from this source plants were forwarded some years later to the French West Indies, and from these all the coffee found in the Western Hemisphere derives its origin.

The Parisians immediately adopted the drink, and it became the fashionable beverage of Paris. It could only be indulged in by the wealthy few, as the price was exorbitant. It is stated that a sum equivalent to $15,000 per year was expended for supplying the daughters of Louis XV. with the beverage.

The English owe to Mr. Edwards, a Turkish merchant, their knowledge of coffee. This gentleman, about the year 1650, brought to England a Greek youth, who used to prepare the drink for his master; the latter, however, finding that the novelty began to attract too many visitors to his home, gave the boy his liberty, and enabled him to open a coffee-house of his own.

At first it met with violent opposition; it was denounced as a "vile drink," "poison," etc. A heavy tax was imposed upon it by the Legislature, but, notwithstanding all opposition, the beverage constantly gained ground, and coffee-houses were as plentiful in London as at Constantinople.

Across the water the custom jumped, and the infant United States commenced to nourish its strength from the coffee-pot; and in no place in the world probably are the influences more healthful, the effects more happily displayed than in that country, especially at the "Old French market" in new Orleans. The coffee vendors are distributed throughout the market place and streets, and are kept as busy as bees supplying cups of coffee to the European, Creole, New Englander, the Westerner, who, standing side by side in the open street, forget caste, and sip the nectar.

The coffee-houses of New York are intimately associated with the history of the city. Here were gathered the leading literary, professional and business men who discussed the leading topics of the day while sipping their cups of coffee.

But the coffee-house is a thing of the past. The more pretentious club-house has taken its place, and the lovers of coffee are forced to the restaurant for their favourite drink.

The United States has been for many years the largest coffee-using country in the world, for the past eight years the average value of imports being $90,000,000 per year. The imports for 1898 exceeded all previous records, being nearly 900,000,000 lbs., which is about 20 per cent. more than in 1897. The latest estimates place the world's production at 1,600,000,000 pounds a year. The United States, therefore, takes practically half the coffee grown in the world. Of the total coffee production, about two-thirds is grown in Brazil. The other third, grown outside of Brazil, is scattered around the world in the belt extending to the 30th degree north and south of the equator.

The steadily increasing popularity of coffee as a drink in the United States, and the steadily decreasing popularity of tea, have led to some revival of the controversy as to the relative merits of these beverages, upon which scientists are not yet agreed.

The partiality for tea or coffee shown by the people of different countries cannot be traced to any particular cause. The English, the Canadians and the Russians, as a rule, come under the head of tea-drinkers, while the Dutch, Scandinavians, Germans and Belgians come under the head of coffee-drinkers, but why this is so has never yet been made clear. The position of the United States in this matter is somewhat unique, the average consumption of tea per capita having remained stationary for twenty-five years while the popularity of coffee as a drink has been steadily increasing; the consumption last year being larger per capita than ever before, and was exceeded only by two countries, Holland and Denmark—the consumption of coffee per capita in Holland being 23 pounds, and in Denmark 15 pounds, while that of the United States was 11 pounds. That of France was 3½ pounds, Great Britain a little less than 1 pound and Canada about the same as the latter.

DISTRICT ASSOCIATIONS.

SHEVAROY.

Proceedings of a Meeting of the Committee of the Shevaroy Planters' Association held in the Victoria Rooms, on Monday, the 1st May, 1899.—Present:—Messrs. J. C. Large, S. M. Hight, Rev. J. M. Kempf, Messrs. Thurston Short, and C. Rahm.

Mr. C. G. Lechler, *Chairman;* Mr. R. Gompertz, *Honorary Secretary.*

1. Read circular from Secretary, U. P. A. S. I, dated 11th ultimo, forwarding correspondence between himself and Mr. Sanderson regarding advertising coffee and prevention of adulteration.

Resolved that, in the opinion of this Association, the campaign against the adulteration of coffee should be re-opened and vigorously prosecuted.

Resolved that this Association considers it essentially necessary to advertise East Indian Coffee and that it is prepared to subscribe (Rs.500) Five hundred Rupees towards the expenses of doing so provided that other Associations approve and will subscribe in proportion.

2. Read circular from Secretary, U. P. A. S. I., dated 12th ultimo, forwarding copy of a letter from the Secretary to the Government of India, Department of Revenue and Agriculture (Commercial Exhibitions), circular No. 15-1-11, dated 25th March 1899.

Resolved that this Association approves of the suggestion of a Coffee-room, in co-operation with the Tea-room of the Indian Tea Association, at the Paris Exhibition of 1900, and is prepared to pay a fair share of the expense.

3. Read letter from Mr. Large, dated 20th ultimo, complaining that he had been summoned as an Assessor to try a native, and that he had been refused anything in the shape of batta on payment of his expenses.

Resolved that the Honorary Secretary be requested to address the Collector on the subject, forwarding a copy of Mr. Large's letter and endeavouring to get Planters exempted, except in the case of a serious offence committed by a European, and requesting that on such occasions their expenses should be paid by Government.

Read and recorded the following letters:—

34/U. W. Circular from Secretary, U. P. A. S. I., regarding the *Adulteration of Coffee.*

35/U. W. Circular from Secretary, U. P. A. S. I., informing that the Madras Government has submitted, for favor of very early remarks, suggestions of the Government of India, regarding the utilization of spare space in the Indian Imperial Court for the *Paris Exhibition.*

36/U. W. Circular from the Secretary, U. P. A. S. I., copy of a letter from the Secretary of the Indian Tea Association, regarding *the exports of Indian tea.*

12/L. Letter from Mr. Large to be brought before the Committee Meeting, regarding the expenses of Planters, who have to be called as Assessors to the Court of Sessions at Salem being paid by Government.

Printed book of new rules of the Shevaroy Planters' Association.

The following papers were laid on the table:—

Proceedings of the Coorg Planters' Association.

Proceedings of the Central Travancore Planters' Association.

Proceedings of the Annual General Meeting of the North Mysore Planters' Association held in the Club, Balehonnur, 22nd March 1899.

(Signed) C. G. LECHLER,
Chairman.

(") R. GOMPERTZ,
Honorary Secretary.

MARKET REPORT.

Per Mail advices of 14th April, 1899.

COFFEE.

The *London Commercial Record* says:—Demand during the past week has been much better, and although the public sales have been so numerous that it has been impossible to complete them, the trade have shewn more willingness to buy. East India has been offered freely; ordinary qualities are still extremely difficult to move, but fair sold at fully previous rates, whilst good to superior were in strong demand at higher prices. Jamaica, which had been almost neglected for some time, met with an improved demand and was chiefly disposed of at steady rates. Costa Rica and Central American descriptions were in request at previous prices to an advance of 1s to 2s per cwt. The market for "futures" has been quiet, and in some instances prices are rather easier, closing as under:—

London	Santos	July delivery	28s 9d
New York	No. 7 Rio	„ „	5.20 cents.
Hamburg	Santos	„ „	29 pf.
Havre	Santos	„ „	35 francs
Holland	Good ordinary Java		27¼ cents.

At the Dutch Trading Company's public sale, held in Amsterdam on Tuesday, 20,710 bags Java, 550 bags Surinam, and 20 cases Padang sold at rather improved rates, although not quite so well as anticipated; good ordinary Java realised 27¼ cents, against 27 cents last sale. The following are some of the particulars:—

Lying in Amsterdam.

No.	Bags.	Valued at Cents.	Result. Cents.
1	500	28	28¾ @ 29¼
2	418	27½	26¾ „ 27
3	318	27	— „ 26¾
4	514	26¾	26¾ „ 27
5	772	28	27 „ 27¼
6	512	27	27 „ 27¾
7	430	27	27 „ 27¼
8	1,071	50	46 „ 46¼
9	1,429	43	— „ 37½
12	1,187	44	44¾ „ 45

Imports, Deliveries and Stock of Coffee in London are as follows:—

		Stock.		Imports.	
		1899.	1898.	1899.	1898.

In the Imports a decrease this year of	1,867 tons.
Home Consumption an increase of	16 „
Export a decrease of	258 „
Stock an increase of	3,116 „

Auctions this week have passed off as under:—

CEYLON.—*Plantation.*—13 casks 13 barrels 22 bags mostly sold—smalls 40s, low middling to middling 85s 6d to 98s, bold 102s to 103s, pea-berry 100s.

EAST INDIA.—Of 4,002 bags offered the greater part sold as follows:—*Mysore*, smalls 39s to 62s 6d, low middling to middling 60s to 67s, good to fine middling 74s to 88s, bold dull gray 72s 6d, good greenish blue 80s to 90s 6d, good to fine bold 93s 6d to 105s, pea-berry 92s to 116s, a fine mark—smalls 84s, medium 107s, bold 120s 6d, pea-berry 116s; *Naidoobatum*, good middling blue 66s 6d to 70s, fine bold 97s to 100s, pea-berry 96s 6d to 100s; *Coorg*, smalls 35s to 38s 6d, low middling 51s, middling 60s to 63s, bold greenish 73s to 80s, fine bold 90s; *Wynaad*, smalls 40s 6d, low middling 52s 6d to 54s, bold 74s; *Neilgherry*, smalls 40s to 46s, low middling 48s 6d to 53s 6d, middling to good middling 56s to 68s, bold rough greenish 66s to 71s, good to fine bold colory 75s to 91s, pea-berry 54s 6d to 90s 6d; *Travancore*, smalls 32s to 35s 6d, low middling colory 53s, bold 75s, pea-berry 45s to 58s. *Nelliampathy*, smalls 43s to 45s, low middling 49s to 54s 6d, bold 61s to 76s, pea-berry 65s 6d to 76s.

MOCHA.—15 half-bales bought in.

NYASALAND.—23 bags pickings sold at 30s 6d to 34s 6d.

AFRICAN.—*Liberian.*—4 bags common greenish sold at 26s.

JAMAICA.—5 casks 370 barrels and 208 bags mostly sold: low to fine ordinary small 23s to 37s, ordinary to good ordinary brownish 28s to 35s 6d, fine fine ordinary 44s to 44s 6d, middling to good middling grayish 50s to 62s, fine bold blue 95s, pea-berry 38s to 80s.

COSTA RICA.—Of 5,412 bags offered the greater part sold—smalls 26s 6d to 48s 6d, good ordinary 37s 6d to 42s, fine fine ordinary greenish 43s 6d to 45s 6d, low middling to middling blue 49s to 59s, good to fine middling 60s to 74s 6d, bold 79s to 87s 6d, fine bold 92s to 103s 6d, pea-berry 47s 6d to 92s.

GUATEMALA.—1,011 bags nearly all sold, smalls 30s to 34s, low middling colory to middling blue 46s 6d to 51s, good middling colory 56s to 66s, good to fine blue bold 70s to 87s 6d, pea-berry 52s 6d to 81s 6d

SALVADOR.—527 bags mostly sold, smalls 30s 6d to 35s 6d, fine fine ordinary 38s 6d to 44s, low middling 44s 6d, middling to good middling 49s to 59s 6d, bold good colory 68s 6d to 72s, pea-berry 52s 6d to 55s.

PERUVIAN.—392 bags mostly sold, smalls 27s, fine fine ordinary greenish 41s to 42s, low middling 43s to 43s 6d, middling to good middling 48s to 55s 6d, pea-berry 45s to 55s 6d.

NICARAGUA.—Of 219 bags offered 20 bags sold, middling dull greenish 52s.

COLOMBIAN.—1,981 bags mostly sold, smalls 27s to 50s, low middling to middling 44s 6d to 53s, good middling 55s to 60s fine middling 56s 6d to 73 6d, good bold 65s 6d to 73s 6d, fine blue ditto 75s to 91s 6d, pea-berry 43s to 65s 6d.

MEXICAN.—50 bags retired.

PORTO RICO.—29 bags bought in.

ECUADOR.—228 bags passed the hammer unsold.

VENEZUELAN.—68 bags withdrawn.

GUAYAQUIL.—314 bags bought in

BRAZIL.—20 bags Santos bought in.

Receipts in Rio and Santos.

Since July 1—	1898-9.	1897-8.	1896-7.	1895-6.
Rio	2,700,000	3,745,000	3,041,000	2,008,000
Santos	4,960,000	5,621,000	4,646,000	2,772,000
Total	7,660,000	9,366,000	7,687,000	4,780,000
Crop	—	10,461,000	8,680,000	5,489,000

Auctions to-day consisted of a portion of yesterday's postponed public sales, Costa Rica being the chief growth represented. The sales went off with slow demand at prices about unchanged.

Prices realized at auctions for some of the principal marks of East India:—

TEA.

China.—There is more demand for Congous and Greens, and quite a brisk tone was observable at the auctions when 5,148 packages offered and mostly sold at very full rates except for Hyson which was rather lower.

Indian.—The market opened after the holidays on Monday the 10th inst, and during the week 22,600 packages were offered against 21,000 packages from the 24th to the 29th ult.

There was a strong demand for nearly all kinds, chiefly concentrated on common to medium which were again dearer. Inferior rough-leaf Souchongs and flaky fannings were eagerly bought up at 7¼d to 7¾d per lb. Ordinary to fair Pekoe Souchongs and Pekoes realised 8d to 8¾d per lb., while medium Pekoes and broken Pekoes often showed an advance of ½d per lb. since the turn of the month. Fine and finest were in somewhat more request than previously.

For 18,200 packages on Estate Account 9¾d per lb. was obtained, or the same as for 17,700 packages a fortnight ago.

Owing partly to the large duty payment made on the 20th March, the deliveries for this month were abnormally heavy, as will be seen from the following:—

	1899.	1898
Imports	6,089,000 lbs.	6,688,000 lbs.
Deliveries	13,149,000 ,,	11,717,000 ,,
Stock, 31st March ...	52,400,000 ,,	59,051,000 ,,

This denotes an unusually favourable position statistically, specially as the Bonded Stock of all Tea in the London warehouses on the 31st ultimo was only 84,770,000 lbs., contrasted with 94,580,000 lbs. on the same date in 1898.

Ceylon.—The first sale after Easter was held on the 11th inst. when 29,600 packages were brought forward opposed to 13,6[illegible] packages on the 28th ult. A good tone generally prevailed though buyers were not as a rule disposed to pay a further rise on Pekoe Souchongs and Pekoes "for price." Medium Pekoes and Broken Pekoes with useful cup up to 9d. per lb. were at times firmer, but quotations for fine and finest were in most instances disappointing

The average, chiefly due to the small proportion of choice invoices, is just above 9d. per lb. On the 29th ult. it was 9¼d. per lb., and 7¼d per lb. on the 6th April in the former year.

Figures for March as issued by the London Tea Brokers' Association are :—

	Imports.	Deliveries.	Stock. 31st March.
1899 ...	8,190,000 lbs.	7,311,000 lbs.	18,106,000 lbs.
1898 ...	7,875,000 „	8,096,000 „	18,074,000 „
1897 ...	6,501,000 „	7,032,000 „	18,547,000 „

Although these clearances were below those of 1898, for the nine months from 1st July last they were one million lbs. in excess of the imports, while it seems that on account of the growing trade from Colombo with Europe, America, the Colonies, &c., shipments to this country will in all probability be less than last year.

Java.—Rather under 2,000 packages of direct import were offered yesterday, and passed with spirited competition, but some irregularity was noticeable for undesirable parcels.

For next and the following weeks 1,900 packages are advertized.

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns, were :—

From 1st to 11th April, 1899	* 9,440,547 lbs.
„ „ 1898	4,982,241 „

Figures, so far as they are available, indicate an increasing rate of consumption, the quantity withdrawn from bond in the United Kingdom for the twelve months ending 31st March, 1899, being approximately as under, compared with the two foregoing years :—

189--1899 ...	... 241,814,000 lbs. yielding	£4,030,000
1897-1898 ...	... 232,496,000 „ „	3,875,000
1896-1897 ...	... 228,355,000 „ „	3,806,000

During the week the following have been printed for sale by public auction :—

	Sold.	Withdrawn	Total offered.
	Pkgs.	Pkgs.	Pkgs.
India ...	... 20,421	2,194	22,615
Ceylon ...	... 29,011	632	29,643
Java ...	... 1,841	97	1,938
Total ...	51,273	2,923	54,196

Also 270 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report dated April 14th, 1899, states :—

QUANTITY BROUGHT TO AUCTION IN LONDON
From 1st June to Date.

	Indian.	Ceylon.	Java.
1898-1899 ...	1,479,901 pkgs.	972,524 pkgs.	41,263 pkgs.
1897-1898 ...	1,416,651 „	1,002,222 „	35,534 „

22,837 pkgs. Indian
30,366 „ Ceylon
2,038 „ Java
} Total 55,241 packages were offered in public auction this week.

Heavy clearances in March have brought up deliveries of Indian Tea for the first ten months of the season to over 13 million pounds above the corresponding period of last season.

Indian. The first sale since Easter was held on Monday when a strong demand prevailed for all descriptions, Teas under 9d. being again slightly dearer. The official wire give exports to U. K. for the 2nd half of March as 105,000 lbs., against 80,000 lbs., making total from 1st April, 1898, to end of March, 1899, as 135,408,000 lbs., against 134,000,000 lbs. in last season. 174 closing Invoices have been sold in public sale, against 166 at the same date last year.

Ceylon. The market opened on Tuesday with a somewhat heavy auction; Teas below 9d, however, were in very strong demand, occasionally selling at slightly dearer rates. Medium and better Teas were irregular and rather weaker. The official telegram gives exports to U. K. during March as 8,500,000 lbs., against 9,500,000 lbs., making the total from 1st Jan. to 31st March as 23,000,000 lbs., against 24,250,000 lbs., same time last year. Estimate for April 7½ to 8 million lbs., against 6,750,000 lbs. shipped in April 1898. Average for week 9·02d.

Java. Sold at rather dearer rates. 9,243 pkgs. are advertised for sale in Amsterdam on 20th inst.

IN CANADA.

The *Canadian Grocer* of 31st March says :—As noted in our market reports, there has been considerable excitement in the tea market since last Wednesday, and quite a large volume of trade has been put through. All kinds, blacks, greens and Ceylons, are very scarce, and values have an advancing tendency.

This is particularly the case in regard to the last-named description of goods, of which the Canadian consumption is undoubtedly increasing each year. In fact, it is difficult for buyers to procure Ceylons at present, and the inside price on them is about 15c.

Prices on them have advanced 2d. during the month, owing to a large increase in the English demand and limited stocks out of which to supply it.

But, in addition to Canadian and British demand, the importation of Ceylon and Indian tea into the United States is on the increase, thousands of packages being taken where only hundreds were taken in years gone by. Indeed, the competition on this continent between Japan teas and these teas from the British possessions is becoming keener each year, and, though the former are expected to retain their advantage, tea dealers state that they will be harder put to it to retain it each year.

PEPPER.

Black.—The market is quiet, and for arrival value is weaker. On the spot sales of fair Singapore have been made at 5 3/16d to 5 7/32d, and for arrival at 5⅜d January-March and March-May shipment, at 5⅜d April-June, and at 5½d June-August. About 150 tons are reported sold.

At public auctions on the 12th inst. 70 bags Singapore were bought in at 5⅜d, and 220 bags Tellicherry at 5d per lb.

White is also cheaper. Singapore on the spot has been sold at 8 9/16d to 8⅝, and Penang at 7 13/16d to 7⅞d. Singapore, May-July shipment has been done at 8½d, June-August at 8⅝d, and Penang May-July at 8⅛ d. per lb. About 100 tons reported done.

Of 524 bags Singapore offered at sale on Wednesday only 12 bags sold "without reserve" at 8¼d for ordinary. Of 156 bags limed Penang 20 bags sold at 7 13/16d. 54 bags Siam bought in at 8¾d per lb.

GINGER.

Cochin.—There was a heavy supply exposed, the total summing to 198 cases 2,006 bags, but, although the small proportion quitted realised about steady prices for cut sorts, and rather lower for rough, bids were generally too low to admit of business. Some people talk of higher price in the near future, but to the average mind everything points to the reverse being the case; in fact, a bid of 23s per cwt. is solicited in the arrival market for a parcel of Calicut assortment, and this, if we mistake not, is the lowest price on record. Under the hammer only 29 cases 130 bags sold, as follows :—medium and bold roughly cut, limed 72s to 76s, medium with a little bold ditto 65s; fine brown washed Calicut rough 32s to 33s 6d, good brown washed tips (in cases) 25s 6d, cuttings 17s per cwt.

Bengal.—20 bags bought in at 22s per cwt.

Jamaica. 534 barrels were offered and about 300 barrels sold at fully valuations to here and there some advance—viz., good bold washed 84s to 90s, medium and bold ditto 74s to 80s, medium and small 69s to 71s, ordinary to good ordinary, rather dark 62s to 67s 6d, common Rhatoon 60s to 60s 6d per cwt.

St. Lucia.—8 bags small to bold realised 63s per cwt.

CINCHONA.

Offered, 162 packages. Sold, 68. At the drug auctions to-day, South American *Crown* bark was the only kind sold, this fetching from 4d to 11d. South American *Calisaya* flats were bought in at 1s. 2d.

Amsterdam Bark Market.—Our Amsterdam representative informs us that at the Dutch cinchona auctions of May 4th, 4,639 packages will be put up (1,272 *druggists'* bark, 3,364 *manufacturers'* bark 3 packages of British-Indian bark). The stock in first hand in Amsterdam, including the above amount was, on the 12th inst., 6,174 packages (2,433 packages of Government bark, and 3,741 private). Both the amount to be offered at auction and the first-hand stock is remarkably small. The latter is the smallest first-hand stock ever held in Amsterdam at any recorded date from the beginning of last year up to the present date; an average stock in 1898 would be about 14,000 packages. Again, the offerings in packages last year at each auction ranged from 5,655 to 9,185, the average being nearly 7,000 packages. Similarly, none of the last five years but has a materially higher average offering than the one at the next auctions. This is one indication that the strength of the natural position of bark and quinine is still increasing.

* As is not unusual, exceptional payments have been made in anticipation of the Budget, which was declared last year on the 21st April.

QUININE.

A remarkable week has passed as regards this article. Our last report left the second-hand market unsettled at 1s. 7d. spot. On Friday there was further weakness, and spot business was done at 1s. 6d. Offers from agents for German factories had been made "bearing" the market, but this was nothing compared to what followed, as by Saturday the tone was better again. On Monday, however, came the shock, for on that day it became known that the agents for German make were offering quinine in bulk at 1s. 6d. The speculative market, which had begun the day firm, was suddenly depressed, and the spot prices fell away again to 1s. 6d. On Tuesday there was a further decline to 1s. 5¾d., May delivery being sold at 1s. 5½d. to 1s. 6d., June at 1s. 6d., and August at 1s. 5½d. The next day the market had been cleared of a good many weak holders, but had been reduced to a dull lifeless condition. At 1s. 6d. and below it is estimated that about 400,000 ounces have been sold this week Howards have reduced their price by 2d., and are "shy sellers" in 1-oz vials and 1,000-oz. lots at 1s. 9d. *Whiffins* bulk price has also been reduced to 1s. 6½d.

CARDAMOMS.

Offered, 804 packages. Sold, 322. Ceylon *Mysore* kind sold at the following rates: Good bold to extra bold, at 3s. 9d. to 3s. 10d (4s. refused for fine ditto); good to fine bold at 3s 2d to 3s 8d; good medium at 2s. 7d. to 2s. 11d.; good small, 2s. 2d. to 2s. 11d. brown spotted to brownish, 1s. 6d. to 2s. 6d; seeds, 2s to 2s. 5d Ceylon *Malabar* sold at from 1s. for low quality to 2s. 5d. for nice pale, and 2s. 2d. to 2s. 4d. for seeds.

The arrivals in Amsterdam from Java last week amounted to 992 packages. As indicating the spirit with which the Java March shipments are regarded in Amsterdam, we note that a leading broker there remarks:—"The Java planters should profit by their recent experience, and remember that, while with a little management the value of their product will increase considerably, injudicious shipments of bark are bound to cause a slump in the market."

No shipments were made from Ceylon during the week ending March 21. The total from January 1 to that date is 141,576 lbs., as compared with 167,533 lbs. on the same date in 1898.

Movements of Tea in London (in lbs.) during March from Tea Brokers' Association Figures.

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittance, should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday the 19th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

COFFEE IN QUEENSLAND.

I.—CULTIVATION.

Consular reports are for the most part dryasdust publications, and useful though the information they contain may be, it is often a relief to seek it elsewhere. In this respect we are fortunately placed as regards the cultivation of coffee in Queensland. During the last session of the Agricultural and Pastoral Conference in that Colony, Mr. T. A. Bromley, of Pialba, gave a very interesting account of his experiences as a coffee-planter. It is the experience of a man who had to grope his way along with very little assistance from outside. He states that he started not at all sure how Coffee would do "as a plantation." He had seen it grow under all sorts of conditions, in all aspects, in various qualities of soil, and at various altitudes above the sea: from just a little above the tide-water to his present estate, probably the highest coffee-growing point in his district. He had seen it doing well on hungry granite, on almost a stone quarry, where fifteen or sixteen year old trees gave splendid crops. Only in one instance had he seen it fail, and then right on the sea-beach, nearly in the sea-sand, not more than 20 feet above the water, and exposed at all times to the northerly wind. Mr. Bromley studied books to some extent, but chiefly some-

what antiquated ones. By practical experience he has found that coffee-growing in Queensland is at many points in touch with coffee-growing elsewhere, but he has also found that there are many points to be observed there that do not tally with the methods adopted in other parts of the world. He says emphatically in regard to coffee cultivation :—"data that one gets from what is written of coffee production in foreign countries cannot be taken as safe data for us to go upon." He agrees that the general principles hold good all the world over, but observes that "the climatic vicissitudes and the adaptability of the plants themselves have all to be re-learned when you come to Queensland."

He then traces his own experience. First, he was careful to select a piece of land sufficiently above the sea-level, and near enough to the sea to get the benefit of the sea-air, with a somewhat moist atmosphere, the right position, and the right texture of soil. He bought land about 400 feet above sea-level, and a mile from the sea, separated from it only by open land. It is red volcanic soil, so friable that you can force an ordinary bar down three or four feet into it in ordinary weather. He obtained 100 trees, and prepared beds thus : he carefully dug the soil to a depth of from 16 to 18 inches, forked it, and took out every root, so as to leave everything free for eventual transplanting He made the ground fairly level, just as if it were an ordinary seed bed, laid off the beds 3 feet wide by 6 or 7 feet long, with paths between, inserted a number of forked sticks, leaving the forks about 5 feet out of the ground, and put saplings on these forks. Over the top of the latter he strewed banana leaves, not altogether intercepting the sun, but making a fair shade. To keep the leaves in place, he laid on a few more saplings. These lasted twelve months longer than they were required. He then withdrew the seeds from the parchment, and put them down about 1 to 1¼ inches, taking care to put the round side up and the flat side down, for he had noticed that the germ came out from the flat side. It was a dry year, and he had to water repeatedly, keeping the soil always *moist*, and no more. After what seemed an unconscionable delay all the seeds seemed to sprout at once, and start away vigorously. He left them there till the spring of the year—about July—then raised the plants, which were from 6 to 8 inches high. Pits 15 inches square and 18 inches deep had been prepared, over new scrub soil, and in refilling the subsoil was replaced first, the surface soil on top. Where the taproot had been injured in any way it was carefully cut with a knife, but those that had not been cut seemed to do best. Loose soil was filled in to the collar of the plant, (but subsequent experience showed it should have been stamped and pressed in) and watering begin. More soil, more water. More soil again. Some split shingles were put on the west of the plants, and they had to be kept there for twelve months, as shade. At the end of twelve months the plants were 18 inches high, at the end of two years they ranged between 2½ and 4 feet, and had to be staked. At two years there were a few flowers and a few berries. Perhaps it would have been better to pick them, but they were left. At three years there was an average crop of 1 lb. of berry to the tree, which was sold at 1*s.* 3*d.* per lb. cleaned and ready for market. In the fourth year the average was 2¾ lbs per tree.

The above is a sketch of part of the history of the original 100 plants, but Mr. Bromley naturally increased this number when he found that a profitable crop was coming in. As regards the distance between trees, he has tried 7 by 7 feet, 8 by 8, 9 by 8, and 10 by 12, but does not say which he has found most effective. He estimates the net return at over £50 per acre. He still has only 5 acres under coffee, for he is testing coffee-growing experimentally. He has seen many trees from which it was possible to get 14 lbs. of berry per tree. He knows of one tree 11 years old that had yielded 33 lbs. of berry in a season, and he has seen seven trees give in all 100 lbs. of finished berry. The first tree referred to was 14 feet high, and had a radius of 6 feet. Every limb of it was pulled down by the weight of fruit. The other seven were grown on hungry granite on the bank of a creek some twenty-five miles inland, and was nearly twenty years old. He did not of course mention these as other than quite exceptional specimens, nor did he recommend the growth of large trees. He is trying two sub-varieties of *Arabica*, Liberian that he had planted having perished at the very first breath of cold air. He considers Liberian too tropical a variety for Queensland, and is growing ordinary Ceylon, and a robust variety from Coorg, with a thick-fleshed leaf. It may perhaps be well to add that very careful observers in Queensland, other than Mr. Bromley, have satisfied themselves that an average yield of 2 to 2½ lbs. per tree may be expected from an estate of, say, 50 acres. It is possible that a somewhat larger tree is grown than is in favour in India ; but, even allowing for this, the above figures show that coffee offers very fair prospects to the planter in Queensland. He has a fairly large market within a short distance from his estate.

EXPERIMENTAL PLANTING.

In an article which we reproduce on another page, the *Madras Mail* refers to Experiment Stations as "An agricultural want" of Southern India, and invites the Government to take a lesson from the plans arrived at by the Russian authorities. All that our contemporary remarks in this connection about agriculture generally applies with peculiar force to that section of it which is often, for convenience, classified under the head of "planting." There are, however, a few words that may be added. For instance, experimental planting is practised in Mauritius, where the scientist tries hard to help his lay brethren. Yet we find the former complaining of indifference on the part of the latter. The Russian scheme referred to by the *Mail* is sound, because it is based on a recognition of the need for co-operation between theory and practice, science and the actual work of the agriculturist or planters. To attain the maximum of success any scheme of experiment stations must be arranged to co-operate with experimental planting on private estates. The report of the Mauritius "Station Agronomique" states :—"We have asked and still continue to ask planters to co operate in our investigations by conducting a few experiments on their estates ; it will cost them but little supervision and will, from whatever point of view they may be regarded, be always productive of results. It would not be indispensable to repeat all the experiments that we have indicated if too much work is apprehended, but every planter might, according to the peculiar conditions of his culture, contribute to the work to

a certain extent and after a time the facts collected at different places will form a source of information of paramount interest. Up to the present we have induced only a few interested parties to contribute to our investigations and it is much to be regretted, the more so as they are not persevered in generally and it is a mistake to deem sufficient a single trial which loses all its value when it is not strengthened and checked by a series of similar trials conducted under different conditions and through several years." The same writer also observes :—" Unfortunately every one believes that he has nothing to learn in that respect and he sticks to his routine which he deems excellent. No doubt experience, especially in regard to agriculture, is the main point; provided, however, that such experience be supported by observation of facts and do not merely rest on the habit of doing work in the same way for a number of years. Sometimes people imagine that they are making an experiment, but the conclusion is not logical; they do not sufficiently take into account the secondary circumstances which may have affected the results, and take figures for granted which would perhaps have been invalidated had they been tested a second time."

BOARD OF TRADE RETURNS.

First Quarter—1899.

Cocoa (raw) arrived much more plentifully than in 1898, and placed the stock on a higher level than previously.

In the first three months.	1899.	1898.	1897.
Imports ... ... lbs.	15,091,912	16,930,855	13,041,873

CINCHONA AND QUININE.

The little spurt that Cinchona and Quinine made recently, soon lost much of its force, yet there appears to be a general belief that a rise is much more probable than a fall. On another page we give a very interesting extract on the subject, and here we may remark that it is believed that a large contingent of outside operators has been interested in 'bulling' quinine of late. No doubt these gentlemen have sought to realise and thus brought about a relapse. A Home contemporary asserts that it had been confidently expected that the value of quinine would run up without a break to 2s. 6d. per oz., forced up by a large demand for cinchona bark and supported by an exceptionally strong and capable clique of bull operators. So great was the belief in the strength of the article and its manipulators that, after an unbroken rise of 11d. per oz., sellers found no difficulty in meeting with large purchasers at that advanced price. Beyond a doubt, the position of the article offered an exceptionally favourable scope for a boom, owing to its abnormal strength. The supply of raw material—Bark—had decreased in an alarming manner from year to year, and had reached a level which proved absolutely inadequate to the demand for the manufactured

article—Quinine. The following figures may be of interest to our readers:—

	Total Export of Ceylon Bark. lbs.	Price of Quinine, Howard's. Per oz.
1877-78	173,497	... 11s 9½d
1878-79	373,511	... 12s 2½d
1879-80	1,208,518	... 12s 0d
1880-81	1,207,720	... 9s 1d
1881-82	3,099,895	... 9s 2½d
1882-83	6,925,595	... 7s 11d
1883-84	11,492,947	... 5s 1¾d
1884-85	11,678,360	... 3s 8½d
1885-86	15,364,912	... 2s 5½d
1886-87	14,389,184	... 2s 4d
1887-88	11,704,932	... 1s 8d
1888-89	10,498,487	... 1s 6d
1890	8,728,836	.. 1s 5d
1891	5,679,334	... 1s 4d
1892	6,793 320	... 1s 3d
1893	3,571,325	... 1s 3d
1894	2,497,616	... 1s 4d
1895	921,085	... 1s 5d
1896	1,309,560	... 1s 3d
1897	653,346	... 1s 3d
1898	...	... 1s 6d

With a falling off in supplies of Bark the demand increased, keeping step with the spreading of the influenza. The only astonishing part of the whole affair to an outside observer, says our contemporary, is that this exceptional position of Bark should have dawned on our market so very suddenly, and that those closely connected with the Bark and Quinine trade should have been utterly blind to the threatening crisis. It seems incredible that a current article, whose real value should be 2s. 6d. per oz., should be kept down to about 1s. per oz., simply because an outside speculative element had failed to notice its exceptionally favourable position for a boom. It is not unreasonable to suppose that, by sheer trade demand, the value of both Bark and Quinine would have been steadily enhanced until a sound commercial basis had been established. However, there was an opening for a bull operation, and bulls have availed themselves successfully of it; it is only the unfortunate outside follower who has contrived to miss his opportunity, and who, as in many similar cases, will have to pay for his blind confidence in his leaders.

COFFEE IN THE UNITED STATES.

The *American Grocer*, after stating that coffee is the most popular beverage in the United States,—the favourite stimulant among all classes—adds that if allowance is made for non-consumers, it is safe to say that coffee-consumers drink on an average nearly thirty gallons of coffee per annum. Remarking that consumers will pardon defects in the quality of a majority of articles quicker than they will poor coffee, our contemporary proceeds to show that there is an unusually wide range in the cost of the raw coffee bean—from 3 to 34 cents—and this demands great discrimination in buying. The higher prices are due to the small supply of certain growths, for which the people have a decided prejudice, rather than for any difference in intrinsic merit. For instance, there are fine marks of Mexican, Central American, Venezuelan, Ceylon, and Jamaica coffee, which for body and flavor equal the best East India sorts, and which cost 10 to 14 cents per pound less. This condition of the market affords the grocer a splendid opportunity to make blends and to develop a trade which can be controlled and made very profitable. Coffee planters in India should be glad to read some of these remarks and to find them supplemented by the following excellent advice:—"Teach consumers to buy in small lots and supply them with fresh-roasted beans—and fresh ground, if so desired. Above all, advertise the coffee department; talk about it; demonstrate its effectiveness and win a reputation of keeping the 'best coffee in town.'

CEYLON TEAS.

The *Observer* continues to institute comparisons between reports from various districts, and apparently finds discrepancies and contradictions everywhere. From Matale East it learns that better quality "is not in the leaf," as it asks, "what better remedy than judiciously selected manure for giving strength and flavour to tea?". Panwila and Wattagama plead the recent drought, and here too the expediency of manuring appears to be recognized. As regards factories, some say they are all right, others that there is not sufficient withering room. Again, one correspondent from Nawalapitiya and Dolosbage side says finer plucking than ever before now obtains, and has resulted in the outturn of better teas. A second, whose experience has evidently not been so progressive, demands finer plucking, and more withering accommodation, especially where leaf is bought for manufacture; and in this he is supported by the third, who holds bad plucking, and bad withering (especially between 15th March and 30th June approximately) when leaf comes in with a rush, as responsible for much; while he also mentions scanty supervision. As regards jât, one report considers it good, as a whole—a good hybrid with some indigenous—saving perhaps about 500 acres in little patches which are inferior China. "Generally good," says the second, while the third declares jât very poor on some estates, and on many no more than fair; only portions of a few estates being planted with good indigenous. The verdict on soil, too, similarly varies. In fact, the variety of reports makes confusion worse confounded and leaves the inquiring mind in a state of puzzlement that finds its only refuge in platitudes. An instance: "If the prices of medium teas do not show an advance, it is because there is less competition for them in the market."

NOTES.

Soil Bacteria that liberate Nitrogen. According to a German writer, such organisms are most abundant in fallow lands, less abundant under leafy plants, and least abundant under cereals.

The Canadian Tea Tariff. Latest telegraphic advices state that the Canadian authorities are not proposing any changes in the Canadian tariff; and no preferential duties in favour of British teas are proposed.

Ceylon Tea Shipments in April 1899. A Fort merchant sends the *Times of Ceylon* the following, the starred total being estimated:—

	1897.	1898.	1899.
United Kingdom ...	9,373,704	6,941,316	7,769,000
Australia	956,977	1,290,955	1,300,000*

Experimental Gardens. *Apropos* of remarks in our editorial columns, we are glad to note that this subject is receiving attention at the hands of planters in the Federated Malay States. They are also advocating the formation of a local Agricultural Department.

Leaf Disease in Africa. The *Central African Times* states that though coffee leaf disease has long been in Africa, there is none in *British Central* Africa. We are glad to hear it, but it was a Zanzibar paper, we believe, that first said that there *was* leaf disease in B.C.A.

Lipton, Limited. Disappointing the expectations of many, Lipton, Limited, are paying 11 per cent. for the year; placing to reserve £45,000, and to capital reserve £44,261 earned prior to the incorporation of the Company; and carying forward £4,391.

The Adulteration of Coffee. Apparently we were wrong in thinking that Home opinion would be in favour of clear labelling of percentages of contents of "mixed" coffees, &c. The Standing Committee on Trade, at any rate, makes no comment on the new Section 12, which merely provides against the *obscuring* of notice of mixture on the label.

A lucky Bargain. A Ceylon paper writes:—We hear of one Nilgherry estate owner who, early in March, sold his (cinchona) bark to the Madras Government Factory at the rate to rule on 1st April. On 29th March the price went up 100 per cent. and so the lucky proprietor has scored, more particularly as there has been a fall since.

The First Planter's Marriage. A visitor at Mlanje, calling on a noted bachelor, remarked that he had a very fine place and said: "All you want to complete it is a wife. Don't you remember that the first planter in far away Eden had a wife?" "Very true," replied Ye Bachelor. "but he did not keep his plantation long after he got his wife."—The *Central African Times* tells this wicked story.

Mr. Richard Blechynden. Mr. Richard Blechynden ceased his engagement as Indian Tea Commissioner in America on Saturday the 29th ultimo, and commenced his new duties and responsibilities in connection with Messrs. Whittall and Co., of Colombo, on the 1st instant. His headquarters will be New York; but the scope of his work under the new circumstances is not a matter on which information can be given.

Java Coffee. Advices received from Batavia, March 31, report the prices realized at the Government auction as follows: Interior, 67 09 florins (24¼c); Mandheling, 87·40 florins (31c); Ankolo, 86 florins (30½c); Ayer Banjies, 79 florins (28c); Painan, 60·37 florins (22c). Hard & Rand purchased 3,200 piculs; Padang Trading Company, 2,600 piculs; Veith Brothers, 1,800 piculs; J. Peet & Co., 1,000 piculs.

The London Tea Market. Messrs. Gow, Wilson and Stanton cabled to Colombo on 4th instant that the London Tea market showed a decline, and demand for poor liquoring sorts was weak. The Ceylon average was 8¼*d.* (¼*d.* on) and the price of Ceylon Pekoe Souchong 7½*d.* (¼*d.* down). Of 21,000 packages offered, 20,000 were sold. Indian average was 8⅞*d* (½*d.* down) and 9,000 packages were sold out of 10,000 offered.

A Tea Factory burnt down in Ceylon. A telegram from Gampola to the *Times of Ceylon* states that the Tembilligalle factory, belonging to Messrs. George Christie and H. C. H. Heycock, was totally destroyed by fire early on the morning of the 5th instant. The outbreak was caused by a cooly overturning a lantern whilst spreading tea leaf. The damage to the property is estimated at nearly Rs.30,000; and 7,000 or 8,000 lbs. of tea were destroyed.

Colombo Tea Sales. At the public sale of tea at Colombo, on the 8th instant, about 8,823 pkgs = 686,176 lbs. were offered, of which about 5,777 pkgs. = 447,513 lbs. were sold. A decided disinclination to buy was noticeable at the sale, says the local *Times*, and prices generally were very irregular; common and medium pekoes were rather easier. Quality of tea offering generally showed a falling-off. Good invoices were offered from: Middleton, Farnham, Arapolakande, and Glassaugh

Ceylon Tea in Russia. At the Annual General Meeting of the shareholders of the South Wanarajah Tea Estates, Limited, the Chairman remarked:—Our teas are selling at satisfactory rates, and in connection with the future of the Ceylon tea industry, it is encouraging to notice the greatly increased demand for the tea from the colonies and especially from Russia, to which country have been shipped from Ceylon direct during the past twelve months 2,714,000 lbs., against 439,350 lbs., the corresponding period of the previous year, and the shipments from London to Russia during last year were 6,675,087 lb., against 6,272,596 lbs. in 1897.

Brazil Coffee. The following brief extract from the *Rio News* of 28th March should be compared with Messrs. W. H. Crossman & Bros' latest circular given on another page:—The committee of coffee factors of Rio de Janeiro, in its report presented on last Friday,

maintains its previous estimate of 3,000,000 bags for the crop of 1899-1900. The committee says that the crop, as well as the trees, has been injured by drought, but that it is not yet possible to estimate the amount of damage thus caused. It is expected that the early maturing of the coffee will cause an increase of 20 per cent. in the receipts at Rio de Janeiro before the 30th of June.

In Praise of Coffee. Britons should drink more coffee, so says *The Lancet*. Nowadays we only consume 12,000 tons a-year, or, one infers, one pound of coffee to ten of tea; "yet coffee, when properly treated, is a most excellent and wholesome article of diet." To be "properly treated" it should contain plenty of milk and sugar, which, added to the nutritive qualities of the coffee berry, "affect the human economy in a peculiarly agreeable and beneficent manner." There is nothing whatever to forbid its habitual use in moderation, whether with meals or at other times.

A nameless Terror! A Colombo paper has the following mysterious paragraph:—Hawaiian Coffee Planters are very much disturbed at the prospect of the *(sic)* disease affecting coffee in Venezuela and certain parts of Central America, getting into their estates. The *Planters' Monthly* says:—"In several of the districts of Central America, where it is now, many of the estates have been rendered almost worthless. This seems to be a different disease from that which destroyed the coffee industry in Ceylon." The disease is caused from two small parasitic fungi, namely, *Stilbum fuvidum* and *Sphœrella coffeicola*.

Fertilizer Experiments. The Massachusetts Hotel Station report states with regard to test with legumes that of the nitrogen fertilizers, nitrate of soda gave the largest crop, followed by barnyard manure, dried blood, and sulphate of quinine, in the order given. Double sulphate of potash and magnesium was more effective than muriate of potash, especially when used in connection with sulphate of ammonia. Nitrogen was tried on crimson clover and other plants, but without appreciable effect. "The failure of the material to benefit the crop appears to be due to the fact that our soils contain the nodular bacteria of the common leguminous crops in sufficient numbers."

Malay Coffee. We take the following from the Report of the U. P. A. of the Federated Malay States for 1898-99:—*Schemes for raising the standard of Malay Plantation Coffee.*—This matter has received close attention during the year. No authentic data of large quantities of coffee produced elsewhere, of the Liberian variety, having fetched higher prices have become available to your Committee. There appears to be little doubt that the flavour of well-matured Malay Peninsula Coffee entitles it to a front rank, and that the development of a demand for it will have to be a matter for individual enterprise, much having already been done and is being done to this end.

Grey Blight on Tea in Ceylon. A Colombo contemporary remarks:—Whether it is a result of the recent severe drought all over the island, or is due to some more permanent cause, there is no doubt that this tea pest is unusually prevalent in some districts of the island at present. It is heard of in Dimbula, as well as in the low-country districts of the Kelani Valley and Kalutara, and in some quarters has caused alarm as to its ultimate effect on the tea. If it is only the result of the prolonged dry weather we have been suffering from, following, as this did, the drought of last year, much importance need not be attached to it, and we think this is the opinion of a good many planters.

Curious Coffee Leaves. A Nelliampathy planter has sent us a few specimens of coffee leaves found on his estate a few days ago. He says:—"Only two trees in the old field have leaves like the specimens, and as I have never seen the like before, I am rather curious to know if it is a freak of nature or a new plant disease." The best description we can give of the leaves is that, at first sight, they look like new and beautifully variegated varieties of *coleus*. The shading—green, pale yellow and russet brown—is exquisite, though one leaf shows no trace of green, merely yellow and russet brown. One leaf is partly eaten, one apparently torn, some others are sound. If our friend can raise many plants bearing similar leaves, he might make more out of them as ornamental foliage plants than as coffee producers in these days of low prices. They would make any ordinary croton look dull and monotonous!

Exports of Bones from Bombay. The following figures exhibit the export of bones from Bombay during the eight years ending 1897-98:—

	Tons.
1890-91	13,653
1891-92	16,281
1892-93	17,569
1893-94	19,458
1894-95	32,387
1895-96	33,018
1896-97	21,297
1897-98	21,447

Nearly 78 per cent. of the exports were taken by the United Kingdom, 17 per cent. by Germany, and the remaining 5 per cent. by Belgium, France, Natal and Japan. Messrs. Coen and Co., of Hubli, supplied about 300 tons of bone meal and bone mixture, against 450 tons during the previous twelve months for use on coffee plantations in North Mysore. The falling-off is attributed to a scanty coffee crop, and to the rising rate of exchange.

The Cost of Quinine. "How much does quinine cost in the bark?" has been a casual question in market circles during the past few weeks, and it is astonishing, says the *Chemist and Druggist*, how few are able to give a pat reply. The simplest rule is to answer this question, "How much does 1¼lb. of 5 per cent. cinchona bark cost at the current unit?" The answer is the price of quinine sulphate in the bark. Thus the present unit is 2½*d.*—*i.e.*, the bark costs 2½*d.* per lb. for each 1 per cent. of quinine sulphate which it yields, so that 1¼ lb. of 5 per cent. bark costs the manufacturers 1·3¼¼*d.* (*sic*). They have to meet all charges upon the bark from the place of sale to their factories, isolate the alkaloid, make it into pure sulphate, and box it. This adds, we are informed on good authority, 4*d.* per oz. to the cost, and after that the

manufacturers have to get their profit. Reduced to a simple algebraic expression the inclusive rule is—

$$u \times 5 \times \frac{5}{4} + 4 = x,$$

where u is the unit in English pence, and x the price of quinine sulphate per oz in pence. The Amsterdam unit is the price in cents. (5c. =1*d*.) per Amsterdam lb., which lb. is about a tenth more than the English lb.

Helopeltis and its Habits.

G. S. writes from Morowa Korle to a Ceylon contemporary that he has had some opportunity during the last six years of studying the little ways of *Helopeltis*. His experience this year appears to be rather at variance with Mr. Green's remarks as to its non-existence during the drier months, inasmuch as it first showed up heavily here in January, increased in February, and was at its worst precisely in the period from the 19th of February to the 19th of March, during which we had an unusual drought. It began to disappear from one field attacked soon after the 19th of March, after the rains set in, and now after about a month, during which it has rained every day, this field is nearly clear of it, though—alas! its effects remain—and it is considerably less in evidence in the other fields. He has known it, however, very bad in rainy weather. It seems to be most capricious in this respect. It has been heavier this year than he has known it for three years past. All the younger tea and the better jât tea seem to be immune from attack; and also he has noticed it most prevalent on tea five to seven months from pruning. The young rank shoots, after pruning, appear to have no attractions for it; and it seems to decrease again as the shoots get small and hard before pruning.

GENERAL ARTICLES.

PRODUCE AND PLANTING.

Tea Planting in Natal.—The United States Consul-General at Cape Town is so interested in the tea cultivation of Natal, that he describes for the benefit of his countrymen the process of cultivation and manufacture in that colony. We give it in his own words, and we leave Indian and Ceylon planters to solve the question whether their brethren in South Africa are up to date in their methods. The picking season in Natal generally commences early in September, and goes on till about the end of the following May. The months of June, July, and August are taken up with digging and manuring the land, and pruning the plants The tea is picked by the coolies, mule carts in different gangs collecting the leaf. Men and women are employed in the picking process. The tea leaf is taken down to the factory, where it is "weighed in." When that is done, it is spread out thinly on frames covered with hessian, for the purpose of "withering," in a temperature of 80 deg. to 90 deg. In the course of twelve hours, the leaf has become perfectly soft. The leaf is then passed through shoots into the machine room, where it is "rolled." When the rolling is finished, the sappy, juicy mass is sent down into the cooling chamber where it is spread out and submitted to the action of the air at a temperature of from 60 deg. to 70 deg. The rolled leaf is then passed to drying trays, on which it is spread out thinly and submitted to a temperature of about 250 deg. the excessive heat staying fermentation, and taking all moisture out of the leaf. The now manufactured article is sent on to the sorting department, where the different grades of Golden Pekoe, Flowery Pekoe, Pekoe Souchong, Souchong, and dust are separated by machinery, which consists of a huge, revolving screen cylinder, the meshes gradually getting larger towards the outer end, so that the dust falls from the separating machine first, and the Souchong last. The smallest leaves on the twig, says the Vice-Consul, when picked, make the finest tea. The tea is then put into air-tight bins where it is allowed to remain from two or three months to mature. After this it goes to the packing department, where it is put into packets or boxes for the trade.

Name, please—The Chancellor of the Exchequer's remarks in reference to the enterprising tea company which wished to make special arrangements with Her Majesty's Customs, whereby it was to be allowed to pay duties on tea then in transit, in order that its cheque for duties might be increased, have given rise to considerable excitement among the big firms. No firm, so far as we are aware, has shown any inclination to own up in the matter. Liptons and the Mazawattee repudiate all connection with the tactics mentioned by Sir M. Hicks-Beach.

Cocoa Cultivation in Trinidad.—In his paper, read before the Royal Colonial Institute last week, on "Trinidad: Its Capabilities and Prominent Products," Sir William Robinson had a good deal to say about cocoa, in the prospects of which he is a firm believer, and which, as he put it, "is pressing very hard upon the heels of sugar" in the island Forty years ago there were only 7,000 acres planted with cocoa. At present there are over 97,000 acres devoted to that crop, and that the industry is the means of distributing in the colony upwards of £270,000 a year. The largest estates now existing have been formed by uniting small areas established under what is known as the contract system. The contractor is generally Spanish, sometimes French The proprietor pays the cost of cutting down the forest, and when so cut the land is turned over to the contractor. He cultivates on it, free of rent, corn, plantains, tanniers, bananas, and pigeon peas for a period of three, five, or seven years. In return for this privilege the contractor undertakes to plant the land properly with cocoa and shade trees, and when he gives the land up the proprietor gives him a shilling for every tree planted. The cost of establishing a cocoa estate in this manner is about £12 or £14 an acre. An acre will yield one and a half bags to three or four on exceptionally good land. A bag weighs 165lbs. It is a fact that land planted in cocoa for sixty years is as good as when it was first cleared. And one of the proprietors in Trinidad has an estate upwards of one hundred years old, which is still yielding large crops. The average annual imports from 1848 to 1857 were valued at £550,000. From 1868 to 1877 they were £1,078,405, and from 1878 to 1887 no less than £1,641,950. Cocoa is fairly remunerative under the most primitive modes of cultivation and preparation, and highly remunerative when properly cultivated and prepared. In addition to large estate owners it is grown by a number of small proprietors; its cultivation requires a comparatively small outlay, and the crop is always saleable for "ready money" Under such circumstances cocoa has become one of the main supports of the retail trade in Trinidad, and has been the means of raising the average value of its yearly imports from a little over a million sterling to a million and a half in the decade ending in 1895. In 1896 the export of cocoa was 23,481,000lbs. valued at £452,000. Low prices and a short crop prevailed in that year The export up to December 22, 1898, was 20,171,000lb. Notwithstanding the large area of land which has recently been taken up in Trinidad for cocoa cultivation, there still remain over 700,000 acres of land in possession of the Crown, nearly 300,000 of which consist of some of the finest virgin soil of the island. Sir William Robinson recommends Trinidad to young and energetic Europeans with small capital.

The Consumption of Coffee—The reference by the Chancellor of the Exchequer to the increase in the consumption of coffee has led the *Westminster Gazette* to enquire into the sudden increase in coffee consumption, and it says "the results of the enquiry are remarkable." Take Spiers and Pond's railway refreshment rooms for example. We learn that at Waterloo alone 220,000 cups of coffee were consumed in the year ended March, 1899, against only 48,000 cups in 1898, while at some of the country stations the consumption of coffee increased sixfold. The 1,200 barmaids of the Spiers and Pond railway refreshment rooms served 134 tons of coffee in 1899, representing 300,160 lbs. and 6,034,000 cups; in 1898 the figures were 48 tons, 107,520 lbs. and 2,678,000 cups, this being an increase of 3,356,000 cups in the year. This may represent a change in public taste, but we should imagine that it must be mainly attributed to the improvement in the cup of coffee supplied under the new refreshment room management of the company.

Spice Prospects.—The landings of black pepper during the first quarter of the year have been restricted to 670 tons, in contrast with 2,015 tons in the same period of 1898; and as the combined deliveries for home use and export were augmented to 1,660 tons,

instead of being only 1,100 tons, the remaining stock has been diminished to 6,280 tons. against 6,575 tons a twelvemonth ago. As a consequence the market has vastly improved, and prices are 1d. per lb. higher than they were in April last. The advance in white pepper is even greater, say 1½d. on the rates of a year back, but the reasons for it are nothing like so cogent as those for the kindred condiment, because no real diminution in the supply has taken place. By the way, it may be interesting to those of an antiquarian turn of mind to learn that in the Middle Ages the price of pepper was so exorbitantly high that it formed one of the inducements which led the Portuguese to seek a sea route to India, and the discovery of the passage round the Cape of Good Hope in 1498 brought about a considerable fall in its price. Returning to present day records, market reports show that in spite of a poorer importation and expanding deliveries, Ceylon cinnamon is several pence per pound cheaper than it was last spring; and, of course the glut of cinnamon chips can be had at proportionately low figures. Ginger, for the most part, has suffered a rather severe depreciation in value. Pearl sago, though offered more liberally than hitherto, has met a readier sale and brought better prices, especially for large grain, than were procurable last season. Arrowroot affords a remarkable instance of reversed statistics, for whereas the receipts have been cut down to 2,620 barrels, as compared with 2,820 barrels in the three months of 1898, the total quantity cleared in 1899 has been swollen to 4,330 barrels, in opposition to 2,680 lbs. last year; and the stock by the close of March had dwindled to 4,080 barrels, as contrasted with 9,300 barrels in 1898 at that date; thus warranting an enhancement in value from 1¾d.—the lowest point—to 2½d. per lb. for St. Vincent of common quality.

AN AGRICULTURAL WANT.

In our issue of the 3rd instant we mentioned that Sir W. T. Thiselton Dyer, K.C.M.G., had remarked that the problem as to which are the best ground-nuts to import with a view to the improvement of the crop in Southern India was one that should be taken up on an experimental farm. This calls attention to a want that has been noted for years past. In other countries, and for that matter in other parts of India, experimental agricultural farms have been conducted for many years. In Madras they have certainly been attempted, but they have never had a fair trial, and at the present moment there is nothing in Southern India that deserves to be compared with the experiment stations of the United States or Java, or the experimental farms of which instances are afforded by Northern India. In fact, things have been allowed to drift so long, that Madras can now take a lesson from even Russia—a country which assuredly should not be able to teach agriculture to an ancient civilisation such as that of India generally, or a modern civilisation such as that of Great Britain. Madras is neglectful of a very important matter, whereas in Russia steps are being taken for the establishment of a system of agricultural experiment stations under the supervision of the Imperial Government. The Ministry of Agriculture lately elaborated a plan for such a system of institutions, which was passed and approved by the Agricultural Council. By this time, possibly, an Imperial decree has been issued definitely inaugurating the system.

As humble students, let us sit at the feet of the Russian agricultural scientists and learn. They, at least, have studied what is going on in the world around them. They have availed themselves of the experience, the successes and the failures, of other nations, and the conclusion they have reached may fairly be regarded as offering a digest of modern agricultural scientific procedure. This conclusion assumes the shape of a plan providing for four classes of institutions, namely, (1) agricultural experiment stations for scientific investigation of problems in agriculture, chiefly laboratory methods; (2) experimental fields (or orchards and gardens) for making field-experiments in the culture, etc., of agricultural crops, with a view to solving questions of a more local character; (3) semi-scientific experiment farms for conducting practical experiments in general farm management under local conditions, studying economic questions, etc., and (4) fields of demonstration (also orchards and gardens of the same character) for demonstrating the application in practice of the results of experiment station work, improved methods which have been tested on the experimental fields, new kinds and varieties of valuable plants, breeds of animals, farm implements, etc. It has been decided also that, where desirable, these four types of stations may be united into one institution with the several departments; or the stations may be divided, again, according to the scope of their work, into (*a*) those that are working on the fundamental principles underlying the practice of general agriculture, and (*b*) those that are studying, by similar methods, questions of a more local character.

In other words, there is to be a classical side as well as a modern side to agricultural education. The former will be represented by institutions located in the vicinity of seats of scientific learning, the latter by institutions in typical agricultural regions. When possible, the latter are to be near the local centres of education. Both classes of experiment stations are to be fully equipped with laboratories and libraries, and agricultural meteorology is to receive attention. Analyses of soils, fertilisers and agricultural products for private persons will be undertaken according to a fixed schedule of fees. The location of fields will be carefully considered and the farms established will correspond in general character to the farms or estates of the localities in which they are situated. There may be affiliated with such farms special departments for horticulture, gardening and agricultural technology, also for the introduction of improved implements, machines and breeds of animals, and for distributing seeds of improved varieties, etc. Meteorological and phenological observations will be conducted, and the rural population are to be afforded opportunities to witness the result. The experiment stations will each have a Director and at least two assistants; the fields and farms, a Director and at least one assistant; and, as far as possible, the managers of the fields of demonstration will be chosen from the local residents and placed under the supervision of experts.

This will suffice to show the main outline, though further details might be cited to show how thorough is the plan decided upon. The main point to notice is that while the Government plans for the establishment and maintenance of the higher-grade institutions, it looks to local Committees, organisations, and public-spirited persons for the establishment of fields and farms where the work is to be of a more practical and popular nature or for purposes of demonstration and is to be restricted to the study of locel questions. On this point the Russian plan might need some little modification to adapt it to India's requirements, but assuredly it is an excellent plan and one that deserves the consideration of the Madras Government with special reference to such crops as ground-nuts, sugar and indigo. The dual aim of the institution is admirable, *viz*, experimental investigations on both scientific and practical questions in agriculture, and the dissemination of information among the people by means of fields of demonstration, popular lectures, and publications. No higher compliment can be paid to the scheme than to say, as the highest American authorities have said, that it "bears evidence of thorough familiarity with the history of the experiment station movements of other countries and the tendencies which have developed." Who can doubt that such a movement as this will eventually result in great benefit to the agriculture of the country?

THE ALLEGED CRIMPING OF COOLIES IN CEYLON.

The following correspondence has been published in the *Times of Ceylon*:—

Kanan Devan Hills Produce Company, Limited, Peria Nurrai Estate, Munaar P. Office, South India, 28th April 1899.

The Editor, "*Times of Ceylon*," Colombo.

Sir,—I have been much amused of late by the letters over anonymous signatures appearing in your journal anent the wholesale crimping of coolies for South India. Some of these letters are more than amusing to us on this side—are actually absurd. Having the Tamil cooly country at our doors, from where we can recruit any amount of labour at a nominal cost of R10 per head, and with no Labour Ordinance to protect us, they can easily get back to their villages, so advances up to R70 per head would be entirely out of the question.

We are well supplied with coolies here at present, and have no occasion to take them from Ceylon even though the aforesaid circumstances were otherwise. It seems obvious that coolies in Ceylon have been working short time and getting short pay during the last year, when economy has been the general rule on estates,

consequently old advances have not been sufficiently reduced and fresh advances have not been forthcoming up to the kanganies' expectations, and they are generally dissatisfied and have taken the opportunity of the rush of flush, caused by the recent rains to start this rumour about coolies getting big advances to come over to S. India, as a lever for the express purpose of forcing the hands of their employers to give out advances.

These letters and editorial remarks appearing in your journal have no doubt materially influenced superintendents to give credence to these rumours and acquiesce in the demand for advances made by exacting kanganies. For the planters' sake I hope this matter will be thoroughly investigated and the fiasco exploded. At the same time I would suggest that you in your editorial capacity (and perhaps the Hatton Petition Drawer in his dual capacity) should print and distribute, slips in Tamil, controverting these rumours and restore the equilibrium of the labour market and thereby do the planting community a REAL SERVICE.

I am, Sir, Yours faithfully,
(Signed) J. A. HUNTER.

1st May, 1899.

DEAR SIR,—Mr. Davidson has wired requesting us to publish the following extract from his letter to us which reached us on Saturday afternoon:—

"I do not know whether the Editor of the '*Times of Ceylon*' refers to this company, or to some one in the Nilgiris, but I do not believe any one in South India is taking labour from Ceylon, unless it be a gang of coolies some planter may have had working to him and who may wish to follow him to India. Personally I only know of one such gang of about 40 coolies who have been declined."

"I think the Editor of the 'Times of Ceylon' is seriously to blame for giving currency to such a report, without apparently attempting first of all to ascertain, if the rumour were well founded. It seems incredible that some superintendents should have been so simple as to make advances to their kanganies, on the strength of the improbable statements made by them regarding labour requirements for South India."

Yours truly,
FINLAY, MUIR & Co.

SIR,—A few remarks from an ex-Ceylon planter, who has often addressed you on the subject of "labour" and its coincidents, may not be out of place *apropos* the recent "crimping scare," which has brought so many to the confessional of your columns.

There be men in Ceylon, surely, who know the labour conditions in this part of the world, viz., no labour laws whatever, and no extradition, and the fact that, if one does the "patriarchal," his cooly may run him in at the nearest kachcheri for "wrongful restraint," and score over him.

The average cooly here does about half the work of his Ceylon *confrere*, and gets about two-thirds his pay, so that on the whole labour is dearer here than in Ceylon.

The average advance is about R10 to R15 per head given for new coolies, and the individual cooly is supposed to work this off during the following ten months from his engagement, when, if he has worked well during that time, he gets his balance pay and a bonus, *i.e.*, a cumbly. He disappears for a couple of months, and comes back to do it over again. It is so arranged, however, that this goes on the whole year round, so that the labour force is fairly constant—and irksome in the matter of "pay-off."

Now, sir, in the face of these facts, he would be a bold planter who would give at a stretch even more than R20 a head, let alone these wild figures, ranging from R45 to R70, which have been quoted by your correspondents! The big "peria kangany," with 500 to 1,000 coolies at his command, and with prestige and property to back him up, has yet to be found over here!—the man who stands responsible to his dorai for all the advances out and seldom fails.

'Tis a matter of "ski-bosh," sir! The old, old game of Chetty-cum-Kangany-cum-Toolakan *vs.* Doraimar! (The unfortunate kangany above is purposely placed between the two *stools*, whence he is bound to fall into a mess!)

I see that the name of the most prominent planter in these parts has been ruthlessly dragged into the question; and again that a leading planter of Ceylon, who scored so well off the "mailed fisters," lately, is keen on going for the white men who crimp! Is the little strip of sea that divides these *quasi-enemies* of so much more importance than the strips of land that divide Matale and Balangode, which, God wot! have seen much more "crimping" than which causes the present outcry?

And, in conclusion, sir, are there not now "on the coast" at least 20,000 trained coolies disbanded by reduction of expenditure during the last 18 months in Ceylon? And had we all, during the last ten years, faced the problem of training 5 per cent new coolies every year from "the Coast," should you not now, in Ceylon, have a reserve force of nearly 100,000 trained coolies to fall back upon - and most of those glad to go back to a country where their individual merits *are* recognized by their masters, instead of being slumped among a crowd of slaves? Apologies for length, sir.—Yours, &c.,

"NOREMACA."

The High Range, Travancore, May 2nd.

THE INDIAN CURRENCY COMMITTEE.

The following analysis (from the *Times*) of the contents of Vol. II. of the minutes of the evidence taken before the Indian Currency Committee, and the extracts we give from the evidence of men who "spoke with authority" will no doubt interest our readers:—

There is plenty of matter that is interesting from the point of view of the student of business, especially business in India and the Far East; but a good deal of the evidence tendered by merchants and traders was hardly relevant to the real issues. The grievance of tea-planters were set forth at great length; but practically the witnesses added nothing to the case, such as it was, made out by Messrs. Christie and Leake, whose views received full exposition in the first part. Indigo-growers are represented by Mr. David Cruickshank, who, like the gentlemen interested in tea, is principally displeased at the closing of the mints, because it prevented the rupee from falling to its bullion level, or, as they prefer to say, its "natural" level, and thus checked exports from India. According to figures supplied by Mr. J. E. O'Conor, late Director of Statistics to the Indian Government, the exports were really checked by other causes. The witnesses whose evidence appears in the present volume number twenty-four, of whom only two are actually connected with the Indian Government at the present moment. Of the remainder, ten are gentlemen engaged in, or formerly engaged in, business with India and the East, and twelve may be described as gentlemen who, for various reasons, are able to contribute valuable evidence. Among them we may mention Lord Northbrook, Lord Aldenham, Lord Farer, Sir John Lubbock, Mr. Leonard Courtney, and Mr. H. D. MacLeod. Mr. Alfred de Rothschlid did not appear as a witness, but he put in an interesting paper of suggestions as to the establishment of a bank in India to absorb the existing Presidency banks, and to provide for the creation of a gold reserve and for the maintenance of a gold currency. This subject has been referred to by more than one witness, and appears to us to be of importance; but it does not demand attention at present, and will not demand it until the adoption of a gold standard is definitely decided on.

The general effect of the evidence is much the same as that given in the former volume, but so far as there is a variation it is in the direction of more definiteness of view. The plan of the Indian Government receives practically no support, and the proposal to re-open the mints gets very little. The most eminent advocate of a return to a real silver standard is Sir Robert Giffen It is interesting to observe that the attitude of those who wish for a "low exchange" is one of compromise as regards the "rating" of the rupee. They would wish to see 1s. 2d., and not 1s. 4d., fixed as its gold value, being nearer its "natural" value, and yet not so ruinous for the finances of the Indian Government as the bullion value (about 10d.*) would be.

LORD NORTHBROOK.

Probably the weightiest witness is Lord Northbrook, whose official connection with India and the India Office dates as far back as 1853, and who was Governor-General from 1872 to 1876. His view as to the policy of closing the mints is thus set forth, in reply to Sir Henry Fowler:—

8,396. 'The first question upon which I ask your opinion is as to the closing of the mints in 1893?—I think I had better explain to the Committee my own individual view upon that question. I had very great doubts at the time whether it was right to close the mints in 1893. After further consideration of the question, and reading

* The bullion value at present is nearer 11d.—ED., *P. O.*

the evidence taken before this Committee, I was satisfied that, as no international arrangement appeared to be practicable for opening other mints to silver at a reasonable ratio to gold (I held that the 15½ to 1 ratio was quite unreasonable and impracticable), the Indian Government were right in closing the mints to silver with a view to changing the standard of value in India from silver to gold. I put that clearly, because, to close the mints in India without establishing a gold standard would, I think, have been wrong. I should like to add that I think the closing of the mints was quite justifiable. It cannot be denied that a Government has a right in certain circumstances to change the standard of value. It is, of course, a serious matter, but there are many countries that have done it quite recently; Germany and France and other countries have changed their standard of value. Therefore, the idea that the Government of India had no right to change the standard of value in India appears to me quite untenable. I myself do not believe that the measure has seriously interfered with public or private interests in India. . . . I was apprehensive when the mints were closed that considerable hardship would be inflicted upon the people who had silver ornaments in India, because they would not any longer be able to exchange their silver ornaments of a certain weight of silver for rupees of the same weight. That apprehension of mine has been very greatly, if not entirely, removed by the evidence given before this Committee by Sir Antony MacDonnell. I consider that Sir Antony MacDonnell is the highest authority that could be examined by the Committee upon the condition of the North-Western Provinces.

Lord Northbrook does not approve of the proposals of the Indian Government, but is in favour of establishing a gold standard. In Lord Northbrook's opinion an effective gold standard implies a gold currency, but it is not necessary that the token silver currency should be convertible into gold to an unlimited extent. Currency notes of high denominations might, he thinks, be made convertible. Sovereigns should be made legal tender and coined at the mints for the public. He does not think it would be necessary to accumulate much gold to ensure the convertibility from time to time of the larger rupee notes. He attaches great importance to the giving of moral and material support to India by the Imperial Government while the change is being made. He is not in favour of waiting:—

8,491. (Mr. Holland). Am I right in understanding that you are in favour of immediate action being taken, or would you rather wait?—If I had the power of settling this question I should not hesitate at once to make the sovereign legal tender in India and to open the mints for the coinage of gold. I do not suppose the Government can do that, but if I could do it I would go at once that far, and no further.

SIR R. GIFFEN.

Sir Robert Giffen wishes to reopen the mints, and his objection to the policy of the Indian Government is based on the theory, controverted by several eminent witnesses, that gold is not suited to the wants of the people of India.

10,106. I understand you to say this, that, assuming a gold currency and a gold standard established, you object to that, because there has not been sufficient evidence given us to show what amount of gold would be required for that purpose?—That is my point, and I think it is a very material one. In the absence of statements by those acquainted with India as to what the amount required would be, I should like to put this to the Committee. If we make the comparison with England, where we have just been discussing the amount of gold in circulation, and comparing the economic circumstances of India, taking out, for the purpose of comparison, the figures of income tax when there was as income tax, or the figures of assessed taxes now, if we compare that with the receipts from income-tax in England, and other direct taxes, you would find this—if we can carry on with £60,000,000 of gold currency in the hands of the people, I doubt very much whether that would give you much more than £3,000,000 for the people of India. No doubt, gold could be used by certain classes in India, and in certain wholesale transactions, but I should like to have some information at to what the highest amount of that gold would be. As far as I can judge, it must necessarily be a small figure, and gold would not be familiar to the general mass of the population in India.

10,107. Are we to understand that you think that, supposing a gold standard were accompanied by an unlimited gold currency, the real amount of gold that would be required would be very small?—That is my opinion, for the currency.

10,108. You say there has been no evidence, but I think Lord Rothschild put it that, at the beginning, £20,000,000 of gold would be sufficient?—My own opinion is that £20,000,000 of gold would be sufficient both for currency and reserves in ordinary cases, and any doubt about the amount of gold that India would require for establishing a proper gold standard and gold currency arises from the existence of the hoards of rupees in India. You must make an offer, if you introduce the gold standard properly, to give gold in exchange for rupees; and the element of uncertainty is the hoards of rupees in existence, which might compel you to provide a much larger sum than the £15,000,000 or £20,000,000, which apparently would be sufficient if you had only the actual circulation to deal with, and were not impeded and hindered by the existence of these hoards of rupees, which you might find it very difficult to deal with.

Most of the other eminent officials and experts, except Sir John Lubbock, Lord Aldenham, and Mr. Courtney, are in favour of a gold standard, though they are not at one as to details. Sir John Lubbock has a scheme of his own, which consists in re-opening the mints and imposing a heavy duty on the importation of silver.

MR. L. COURTNEY.

Mr. Courtney, who was a member of the Herschell Committee and approved its decision, is in favour of taking no further steps at present, except to open the mints to the coinage of gold. His position is thus set forth:—

12,994. (Chairman). What has been the result of that policy?—In my view the result has entirely justified the action then taken. It has secured the ends that we had in view. It has established practically by degrees by a slow process, but it could not be done at once—what I think may be trusted as a stationary ratio between the rupee and the sovereign, and that stationary ratio is 1s. 4d. In consequence of the other steps that we recommended at the time, that has operated in the way of removing, except under extraordinary circumstances, the perennial deficit and the danger of the deficit coming on the Indian Finance Minister without any warning from causes over which he has no control whatever. He has now, like every other Finance Minister, to face the possibility of deficits, but they will not arise in my view from any depreciation of the rupee in the near future.

12,995. You regard that figure of 1s. 4d. as practically stationary?—I regard that figure as practically stationary.

12,996. Will you tell us what you think are the reasons why it has risen to that figure?—I contemplated from the first that there would be a gradual rise to that figure and that we should see in India experiences analogous to what we were called upon to watch in other countries in the course of our investigations. For example, the rise in the value of the paper currency in the United States after the great war. It took some time to rise, but it rose practically from no contraction, as far as I remember—very little contraction—of the mass of currency, but, the amount being fixed in substance, the growth of transactions of the United States, which is, of course, very much more rapid and of much greater elasticity than the transactions in India could possibly be, had risen to the level requiring, you may say, the quantity of currency which was found in circulation, and that currency obtained in that way a par relation to the gold it represented.

12,997. It would be a legitimate contraction of the currency you mean?—It would not be an absolute contraction in itself. Relatively it would be a contraction, because the amount of the currency would diminish in proportion to the growth of the transactions which it had to carry.

He further says. In reply to question 12,998:—

12,998. I consider that the action that we adopted would result in the introduction of supplementary gold currency which would not get into common circulation any more than £50 notes are in common circulation in England or even £5 notes; they are not the circulation of the poor, but the gold would come into India and would form part, although comparatively a dormant part, of the actual currency of India as much as the rupees which are in circulation, and in my view the currency would go on receiving automatic accretions as the course of trade required.

12,999. (Sir F. Mowatt). Your answer contemplates that the gold should be currency as well as standard?—I think that will follow from the usual habits and modes of living of men.

13,000. I mean you are contemplating its passing into the coinage?—It is not at all necessary that the coins should be coined in

India, although that might be advantageous. It is quite sufficient if a man in India with a sovereign in his pocket knows that he can get Rs.15 for it. When that gets to be present in the Indian mercantile mind, then the gold will come side by side with rupees.

Mr. Courtney proposes to let the Indian system move slowly and cautiously in the direction of a "supplementary gold currency," but he keeps in mind the possibility of something happening to raise the price of silver relatively to gold, in which case "we should get reproduced a situation very much better than the present." Mr. Courtney, as might be expected, is not much impressed with the complaints of those who allege that India is injured in competing with silver using countries by the present system.

THE BRAZILIAN COFFEE CROP.

Messrs. W. H. Crossman and Brother, of New York, write as follows on the position and prospects of Brazilian coffee:—"The receipts in Brazil up to date confirm the figures we have previously given on the current crop. In Santos the receipts already reach 5,000,000 bags, which make it probable that the total there will exceed 5,500,000 bags. In Rio, so far, the receipts are 2,700,000 bags, but in that port they again neglect to count the coffees sent down from the interior direct for export, the quantity received in this way being about 125,000 bags up to date. The total in Rio for the crop year, however, will be close to 3,500,000 bags, the aggregate for the two ports no doubt reaching 9,000,000 bags. Regarding the next crop, it is now well known that the Brazilians are averse to giving out figures, but they are practically unanimous in stating the next crop to be larger than the present one—some claim 10 per cent. more and others as much as 20 per cent. more. But whatever the figure finally reaches, it is positively immaterial, since the fourth consecutive large crop in excess of the requirements of consumption will mean a continuation of very low prices. With three large crops in Rio and Santos aggregating 28,000,000 bags, and a fourth (claimed to be a 'record breaker') to follow, it is no longer a question how much coffee is on the trees; it is a question how much coffee is in the warehouses, the surplus production of the last three seasons. With the heavy supplies existing in consuming countries, it matters little how the Brazilians choose to market their crop. Last November and December they held their coffee back in their interior, only to send it down in larger volume later on, at a period when receipts usually are lighter. But all attempts to deceive consuming countries as to the extent of the crop only make more manifest such proofs of weakness. A business-like, straightforward action would result better for all concerned. There are a great many who speak about 5-cent coffee as being very cheap, and that the Brazilians cannot raise it at that price. Whether they can or not we are not prepared to discuss. The real fact is there is no 5-cent coffee sold anywhere. Not only in Brazil, but also in the United States, there is an idea that the so-called coffee war is one of the reasons for the heavy decline in coffee. No greater fallacy than this could be put forward, since the price of No. 7 coffee— the basis for the roasting business—has declined far less than any other quality. In Europe, where there certainly is no coffee war, the decline in coffee has been much more marked than here; and here the price of all mild coffees and high grades has continued to go down, while that of No. 7 has been held up by the strenuous efforts of many large and small roasters in this country, who for the past two years have been accumulating large stocks for the express purpose of preventing a further decline in roasting grades; and this strange action on the part of manufacturers buying their raw material, not as low as possible, but at as high a price as they can make it, can be traced only to their strong desire and efforts to check a further decline in the roasted article from their competitors. Regarding consumption, we suppose that the ordinary increase is going on here as well as in Europe. The deliveries, however, which show a much larger percentage than consumption is actually increasing, simply means transfers from the visible to the invisible supplies, the same as occurred at the low prices ruling 1884-86. It is now a question which country can produce coffee at the cheapest rate or price. We believe that so long as illiterate labour in Brazil, which is now recruited chiefly from Italians and the coloured races (the majority without the ability to read or write), is willing to accept the present milreis in payment for their wages, Brazil can produce coffee as cheap as any other country, and probably cheaper. It is doubtful whether coffee countries can readily substitute other products where they now raise coffee, and the abandonment of new plantations where new trees are coming into fruit-bearing, in all parts of the world and Brazil—new trees being set out within the past two years—is not to be supposed as likely, and for this reason we believe the price of coffee will have to go considerably lower before the over-production will cease. The law of averages is the surest guide to be taken in regard to values of any staple. The extremely high values and immense profits to planters in all countries up to two years ago have been the inducements that have brought about such enormous over-production, assisted, of course, by the low price of labour paid in degenerate currency or silver, which latter has declined so heavily. These elements combined have wrought the financial ruin of nearly all coffee-growing countries and caused enormous losses for consuming countries, which effects will last until the evil causes are removed or corrected. During the past five years, interior points in Europe and the United States have been importing direct from producing countries, and the larger the arrival of steamers within a given time the larger the deliveries have been, independent of the actual trade demand. This means that the interior has become more independent of the seaports, carrying stocks at home, and replenishing in most instances without relieving the seaports to any great extent. For this reason the enormous stocks carried in the seaports are a much greater menace to the position, and the expense of carrying same continues so much longer than would be the case if the interior simply supplied its wants from the stocks carried at the seaboard in this country. The price for the current month marks the actual cash value of the merchandise. The heavy premium paid for next season's crop (futures) could only be justified by the fact of going into a smaller, instead of a larger, crop. With every probability of the next crop again adding to the surplus supplies, it is difficult to explain why 10 per cent. more is paid for future than for spot positions; same may be based upon hopes, but not upon facts. It is useless for the Brazilians and disappointed speculators to seek explanations for the decline in any other directions than those shown above."

CEYLON TEA IN AMERICA.

The United States is taking more Ceylon tea than ever; but the product comes in for a good deal of adverse criticism from the friends of Chinese tea. Mr. Joseph H. Lester, of New York, who is a member of the Tea Association and an expert, says that "India-Ceylon teas do not compare with the finer varieties of Chinese"; but he admits that "they are rapidly displacing the China Congou varieties." Mr. Russell Bleecker, who is also a member of the Tea Association, says: "The India-Ceylon teas are more astringent than the China teas, and it is doubtful whether much of it is sold straight. It does not rank with the higher grades of China teas, and can hardly be said to enter into competition with any save the China Congou varieties."

On this subject Mr. R Blechynden remarks:—"There can be no doubt in the mind of anyone who has looked into the subject at all that the India-Ceylon teas are not only displacing the China Congou teas, but other teas as well. A great factor in this has been the high rates of duty imposed on teas, and the establishment of the so-called standards. The people here are looking for a cheap-priced tea, and in order to sell China teas in competition with the India-Ceylon teas under the present rate of duty, it is necessary to import some of the very lowest grades in order to be able to sell a low-priced article. Tea on the spot in China costs so much to grow, and so much for delivery at the seaport, that when these charges are paid, in order to make a profit, the importer cannot under any circumstances afford to buy high-grade teas. As an evidence of the efforts that are being made to introduce low-grade teas, it may be said that during last year importers of China teas have had 2,000,000 lbs. rejected at the ports of entry as being below the standard, while no India-Ceylon teas have been turned back. This in itself goes to prove that the efforts of many importers are bent towards bringing into the country teas that will just pass the standard, because the lower the grade the more profit there will be in selling at the low prices now ruling. The lowest grades of China teas are certainly decidedly inferior to the grades of India-Ceylon teas that are being sold. There are no really high-class China teas imported into this country. China's best tea is consumed in Russia, and we get only the mediocre grades."

STRAY NOTES ON MANURES.

Quick-Acting Mineral Fertilizers.—Where additional nitrogen is required for plant development, nitrate of soda is valuable either in field, garden or greenhouse. The plant food in this material is ready to be used at once. In other words it is in the most available form. In addition to the direct benefit it is doubtless true that the portion of fertilizer which remains in the soil after nitrogen has been used for plant growth, neutralizes the soil acidity and consequently gives better conditions for thrifty growth. The soils upon which grain and garden crops fail altogether are probably acid. If this is found to be true, other fertilizing material, notably lime, should be used in addition to nitrate of soda.

Extensive experiments have been made by the R. I. experts along this line and it was found that the most convenient and cheapest materials for correcting soil acidity are air-slaked lime and wood ashes. The fact that an application of wood ashes often shows a marked effect for many years, is doubtless due to the influence of the 30 or more per cent. of carbonate of lime which they contain. This neutralizes the acidity and helps to promote nitrification. One ton per acre of air-slaked lime is capable of producing surprising results, and an application of lime has to be made but once in seven years. At the R. I. test referred to lime was applied in 1894. None has been applied since. To other parts where lime had been added since then there has been no additional increase in the yield, due to the extra lime. All of these plots were fertilized with annual applications of nitrate of soda, muriate of potash and a suitable quantity of phosphoric acid. Garden crops are notably affected by the application of nitrate of soda. For garden crops and vines the following quantity per acre is recommended: Nitrate of soda 450 lbs., fine ground bone 500 lbs. dissolved phosphate rock 500 lbs., muriate of potash 300 lbs. Root crops such as mangels should have the folowing: Nitrate of soda 360 lbs., dissolved phosphate rock 840 lbs., and muriate of potash 300 lbs. For Indian corn the following is recommended: Nitrate of soda 225 lbs., dissolved phosphate rock 420 lbs., fine ground bone 150 lbs., muriate of potash 120 lbs.

Where lime is to be applied, probably the best time in the rotation is when the ground is seeded to grass. Spread on two or three tons per acre of lime. If wood ashes are to be used instead of lime apply 100 bushels or about two tons per acre. The lime must be thoroughly slaked before it is put on the field, for if caustic lime comes in contact with any plant-life, it will kill it. If any lumps remain and the field is to be immediately seeded they must be removed. For fall seeding to grass land, if the lime has been applied, put on the following per acre: Nitrate of soda 50 to 100 lbs., muriate of potash 50 to 100 lbs., fine ground bone 400 to 600 lbs. Each spring after the young grass seed has started into growth apply the following top-dressing: Nitrate of soda 130 lbs. per acre, muriate of potash 100 lbs.

As a rule, nitrate of soda furnishes 15 to 16 lbs. of nitrogen for every 100 lbs. of material used. Muriate of potash yields about 50 lbs. of actual potash for every 100 lbs. The phosphatic materials used in the formulas recommended are much more variable in composition. Dissolved boneblack usually contains 15 to 16 lbs. of phosphoric acid to 100 lbs. of material and the dissolved phosphate rock 13 lbs. Fine ground bone contains 2 lbs. of nitrogen per 100, and 20 to 27 of phosphoric acid. In preparing these formulas the relative costs of the materials must always be considered.

Salt as a Fertilizer.—W. P. Brooks, Mass. Ag'l. College, writes:—The use of salt will not prevent injuries by worms in the soil. Salt in sufficient quantities to repel the worms would prove injurious to the crop. Where beneficial, salt acts rather indirectly than as a direct manure. It attracts moisture and helps to bind the particles of soil, thus enabling it to hold water much more retentively, and enabling it therefore to raise water by capillary attraction from below in greater quantities. Salt, moreover, sometimes assists to make inert plant food which is present in the soil available to the crop.

Salt is not itself taken up by plants of most kinds in such quantities that it becomes necessary to apply it in order to keep up the supply. Salt is present in moderate quantities in all soils, or at least its constituents, soda and chlorine are, present and commonly in amounts fully equal to the requirements of our crops. A possible exception is the mangel-wurzel, which often appears to be benefited by an application of salt.

It appears to be possible to get all the indirect benefits which sometimes follow the application of salt to light, dry soils by an application of muriate of potash, which in its chemical properties is very similar to salt. In other words, by an application of muriate of potash the soil attracts moisture more largely and holds and conducts water to a greater extent.

Now if, instead of salt, we employ the muriate of potash we get the improvement in the physical condition in the soil and at the same time we have in addition one of the most valuable and most frequently deficient elements of plant food—potash. Especially is it found that light, sandy soils often contain too little of this element. Apply muriate of potash at the rate of 300 or 350 lbs. to the acre. Put this on in the fall if possible, but do not hesitate to apply it in early spring. I should prefer to spread it after plowing and harrowing.

In place of the muriate of potash it may possibly be expedient, once at least, to apply kainit to each of the fields. This contains considerable common salt as well as potash. It costs about $15 a ton, while the muriate of potash costs about $40. The kainit, however, must be applied in considerably larger amounts. To get the same amount of potash as would be contained in 300 lbs. of muriate of potash it will be necessary to use about 1,200 lbs. of kainit. The immediate benefit to the soil would undoubtedly be greater in the case of the kainit than with the muriate of potash.

Lime for Field Crops.—The application of lime in some Ala tests to soils devoted to corn, tomatoes, lettuce and tobacco greatly increased the yield and the quality of the crops. With the tomatoes it was noticed that heavily limed plats were remarkably free from blight and other fungous diseases. The soil was limed at the rate of from 15 to 45 barrels per acre.

When Green Manuring is profitable.—Prof. William P. Brooks, Massachusetts, remarks:—In the majority of instances a crop which has been grown will be worth more to feed than it is for turning under. A crop standing in the field has a certain value as a means of soil improvement, a certain manurial value. It has also, in almost all cases, a certain value as food. It may be used as a food either by pasturing it or cutting and feeding in the barn. In either case, under proper management the excreta of the animals consuming the crop will be worth as manure about three-fourths as much as the entire crop would be worth if incorporated in the soil. If we turn the crop under, then in the one case we get its full manurial value. If, on the other hand, we feed it and carefully save and apply the excreta, or if we pasture and so manage that the droppings are evenly distributed. we have the food value and about three-fourths of the manurial value. The sum of these two in the great majority of instances will be greater than the full manurial value. There are, of course, conditions under which the crop cannot be profitably fed, either because of the absence of stock necessary to consume it or because of the location of the field. In such cases, the turning under of the entire crop may be wisest.

There can be no doubt that the latter practice is much more often in place upon light and sandy soils than upon the better soils. Upon the light and poor soils, legumes, not finding nitrogen in the soil, are forced to take it from the air. Upon the richer soils they would take it from the soil itself and there would be no essential increase in this element as a result of green manuring. This has been very strikingly shown by Julius Kuhn. Kuhn's experiments were carried out in 1891 at Halle, Germany. The soil was a good medium loam. It had produced wheat in 1890. After the wheat was harvested a mixture of 194 lbs. of peas, 44 lbs. of vetch and 35 lbs. of yellow lupine seed per acre was sown. The resulting crop was plowed under the last of October and rye was sown. The quantity of green material plowed in amounted to 8,650 lbs. per acre. This supplied about 50 lbs. of nitrogen. In the spring of 1892 the field was sown to barley, and also an adjoining field not green manured. The crops were practically equal under the two methods of treatment. In this case, then, green manuring produced no appreciable benefit. Kuhn estimated that the crop plowed in would have been worth for feeding about $13 per acre. On the other hand, the same experimenter found that on a sandy loam, green manuring with field peas sown in the rye stubble after harvesting increased the crop of barley the following year to the same extent as an application of about 175 lbs. of nitrate of soda. In the latter case, green manuring paid, while in the first it was attended with loss.

Numerous experiments in the United States establish beyond a doubt the possible benefits of green manuring upon the lighter and poorer soils. It is important to point out that even when the

crop is fed the manurial value of its stubble and roots may be considerable. Especially is this true concerning the lugumes (clover-like plants). A great deal of work to determine the manurial value of the stubble of different crops has been carried out at the Storrs School Experiment Station, Ct. . . .

It seems desirable to remark, that while the work was no doubt accurately done it appears doubtful, in view of known facts and the results of others, whether the results of these investigations do justice to the plants of the clover family. Indeed, in his report the author quotes results of other investigators, showing several times more nitrogen in roots and stubble of clover than his own investigation discovers. Thus, for example, Dr. Voelcker, of England, is quoted as reporting 100 lbs. of nitrogen per acre in the roots only of clover, while Dr. Weiske, of Germany, is quoted as reporting 180 lbs. in the roots and stubble. Dr. Weiske is also quoted as reporting in the roots and stubble of rye 62 lbs. of nitrogen per acre, of barley 22 lbs., of oats 25 lbs., of buckwheat 45 lbs., of peas 53 lbs, and of lupines 58 lbs. Though differing in detail, all these results demonstrate in a striking manner the fact that stubble and roots have a large manurial value. It would seem, therefore, in the great majority of instances that the feeding of the crop, the careful saving and application of the excreta of the animals consuming it, together with the manurial value of the stubble and roots, will give us the largest possible returns.

Cob and Coal Ashes are excellent for applying as a mulch for trees and shrubs during a drouthy season. They contain considerable fertilizing elements which all trees and fruits need. The matter of a mulch retarding the development of buds in the spring is a disputed question. It is admitted, however, by most horticulturists that little can be expected from this source, as experiments show that but very little benefit has ever been derived by attempting to retard the swelling of the buds in spring by means of mulch. Give the trees good cultivation and feed the soil liberally if it needs it, have the plant ripen its new wood early in the fall and then if the season is at all favorable you will have plenty of fruit.

VANILLA PLANIFOLIA.

Having secured a good crop of Vanilla pods this season, Mr. Geo. Wythes writes to the *Gardener's Chronicle* describing his method of procedure. He says:—We do not always thus succeed in fruiting the species, though generally the plant produces a fair amount of bloom. I have never known a pod to set naturally, and this shows the need there is to understand the peculiar formation of the flowers. The pollen is so much closed in, that considerable care is necessary to remove it to the stigma. Flowers that have not been artificially pollinated sometimes develop pods, but these fall as soon as half-grown, and are useless. In my previous note above referred to, I stated that we had recently planted this vanilla in a new position, and had given it more exposure. This has yielded us much better results, and though a partial shade is necessary when the plant is in active growth, it is injurious from October until March.

A total failure one year in the case of plants growing in shade, and of others in comparative light, induced us to plant in another house, where they were more fully exposed, and here we have had splendid results, some of the clusters having over twenty pods, and seven clusters on a single growth. The growths are very strong and healthy. Therefore, though partial shade is necessary during the hottest part of the day, I would condemn the use of one continuously. Though we have bees very close to the house, they do not appear to take the least notice of the plant when in flower; but it must be borne in mind that there are few flowers only open at the same time. They are rather insignificant also, being of a greenish colour, and devoid of aroma. It is important that the shoots be well ripened, and after the end of August I would shade but very little. The leaves under this culture will have less colour. We give a lower temperature in the winter months than is frequently advised. From March to the early part of September moisture is given freely, and the plants throw out thick fleshy roots, which lay hold of the wall or the woodwork with which they come into contact. What is termed a brisk stove heat is suitable during the growing season, but in the autumn and winter months 60° by day and 55° by night will suffice. The plants should not be syringed during the winter, as, if the pods are numerous, the syringing causes them to decay at the ends.

As regards temperature, I do not think a few degrees of heat more or less in the growing season of much importance if there is an ample supply of atmospheric moisture. We syringe three times daily, unless the plants are in flower, when it is best to keep the foliage dry. The vanilla grows grandly in a pine-stove if placed in such a position that the stems can get hold of some support upon which to fasten their roots. Having so few roots, only a shallow border is needed This in our case is not more than 6 inches. The compost should be good fibrous peat, with large lumps of charcoal and clean potsherds. No matter how grown, the plants have a tendency to get naked at the base. We therefore take down each spring some of the best top-growths, and place these at the base, giving some fresh material for them to root into, keeping the house for the time a little closer, and syringing freely. The pods after setting, are only a few weeks before they are of full size, but they remain for seven or eight months on the plants before they begin to colour. This is an advantage, as the plant in a fruiting state is an interesting object. When the fruits are gathered, they should be kept in a drawer or other dry place. They are best kept in an air-tight compartment. When quite ripe, they then keep good for years, retaining their rich aroma. I have not spoken upon pot-culture, as I regard the one described as the most suitable.

TEA, &c., COMPANIES.

The South Wanarajah Tea Estates, Limited.—The actual amount of tea sold was 444,384 lbs. including about 60,000 lbs. of bought leaf The gross selling price has averaged 6·81d. per lb., as against 6·51d. per lb. last year. Dividend of 5 per cent declared.

The Beaumont (Ceylon Proprietary) Tea Estates Co., Ld., declares a dividend of two per cent. [against five per cent. last year].

The Scottish Ceylon Tea Co., Ld., declares a dividend of six-and-a-half per cent. [against ten per cent. last year],

[The above is from the *Ceylon Observer*. The *Times of Ceylon* tells a different tale, saying:—

The profits of the **Scottish Ceylon Tea Company** for the past year amounted to £5,186, and the ordinary shares receive 10 per cent. for the year.

The **Ceylon Proprietory Tea Estates Company** has a net profit of £5,244, out of which the ordinary shareholders receive 4 per cent. for the year.

It is curious how our two contemporaries never *can* agree.]

The Mazawatte Tea Company An issue of 14,000 five per cent. cumulative £5 preference shares is announced. These shares form part of 20,000 in all, by the creation of which the capital of the company is raised to £650,000, viz., £300,000 in preferenee and £350,000 in ordinary shares, the former of £5, and the latter of £1. It is stated in the prospects that the money now to be raised will be devoted to new factories and warehouses, by the help of which the company's business will be concentrated and economies effected.

Sunnygama (Ceylon) Tea Estates.—The directors, in their report for the year ended December 31 last, state that the Sunnycroft division shows an increase over last year of 70,117 lbs.; but, owing to a bad attack of mosquito blight from which Pambagama suffered through a great part of the season, there has been a loss of 36,367 lbs. on that division, reducing the total increase to 33,750 lbs. The accounts, after deducting the interest on debentures, £580, show a profit of £2,299. which, added to the amount already at credit of revenue account, gives a total amount for division of £2,495. After payment of interim dividends on preference and ordinary shares at 3 per cent. and final dividend on preference shares at 3 per cent. there is a balance to carry forward of £95. Estimates for the current year for crop and expenditure (Ceylon) represent a laid-down cost of about 4 15-16d. per pound in London.

DISTRICT ASSOCIATIONS.

SOUTH MYSORE.

The Annual General Meeting was held at Munzerabad Club, Saklaspur, on the 30th ultimo:—PRESENT: F. Lonsdale Allen, R. A. Anderson, Graham Anderson, C.I.E., J. E. Butcher, W. L. Crawford, J. G. Crawford, Thos. Hunt, W. Lawder, C. Lake, A. R. Park *(President)*, E M. Playfair, S. Sladden, and R. Taylor. *Visitors*: Messrs. Barclay and Roffey.

The President informed the Meeting that owing to sudden and severe indisposition, the Honorary Secretary, Mr J. A. Harris, was unable to attend, and called on the Vice-President (Mr. Playfair) to read the following Annual Report :—

Gentlemen,—It is my pleasant duty to report that the somewhat gloomy forebodings expressed early in the year have not been realised, and that the season, on the whole, has been a moderately good one. The advices of sales of East India that have reached us indicate a depressed state of the market, which, owing to the increasing production in different parts of the world, seems likely to continue for some time. The cardamom crop was above average, but prices were lower, ruling from Rs.50 to Rs.60 per maund. Leaf disease has been less prevalent than for some years past. Crop prospects for the coming year are favourable, and the rain which fell in February has not on the whole been prejudicial.

The Plague.—The terrible outbreaks of this disease in several parts of the Province have been an appalling feature of the past year and the efforts of Government to stamp it out have been watched by this Association with sympathy as well as anxiety. It is satisfactory to notice how suddenly it collapsed in Bangalore, and it is hoped there will soon be a subsidence in Mysore. We may congratulate ourselves that it has so far practically been shut out of Kadur and Hassan, and our thanks are due to the Deputy Commissioners of these Districts and to those working under them for their untiring efforts in establishing and working an effective organisation. Should members complain that the Association has achieved little during the past year, I would ask them to remember that the executive purposely refrained from action which would in any degree have harassed Government at a time when it was contending with this epidemic.

S. I. P. E. C.—The Resolution of the Government of India has been before you for some weeks. From the time taken in coming to a decision, one might have expected a fuller and more conclusive statement. It is satisfactory, however, that the general tenor is favourable, but as was pointed out by the Chairman of the U. P. A., it is of the highest importance that, should a labourer be allowed to rescind his contract, the forfeit money should be deterrent and that six months' notice should be given. As regards the extradition proposals, if Government will not recognise Breach of Contract as a non-bailable offence, I think Magistrates should be obliged to inquire into the *bona fides* of the security offered. This, be it noted, is of equal importance with respect to cases within the jurisdiction of the Courts issuing the warrants. There appears to be no such obligation laid down in the Criminal Procedure Code. As regards the "other safeguards" referred to, it is advisable that we should endeavour to prevail on Government to make these as simple as possible, as otherwise the procedure might be found so cumbersome as to deter employers from applying for warrants.

Agricultural Chemist.—The outcome of the various discussions that have taken place, as far as Mysore is concerned, is the appointment of Dr. Lehmann, the Dewan exhibiting in the matter his accustomed liberal-mindedness. All those who are interested in agriculture cannot fail to be gratified at the appointment of so highly qualified a Chemist, and I hope shortly we may learn what course the Durbar intend pursuing as regards his work. Meanwhile he has lost no time in showing a desire to become acquainted with the local circumstances, as is seen by his present visit to this district.

U. P. A. S. I.—I refer you to the "Proceedings" for full particulars of the business of the year. Since their publication two matters of interest have been the subject of correspondence :—

(1) The classification of coffee.—As Reuters now quote Mysore, as well as other qualities, our wishes in this respect have been met, and as regards uniform sizing, it appears that the meshes in use are as nearly similar as the variations in size and shape of beans will admit.

(2) Co-operation.—This idea is a natural result of bad seasons, low prices, and high exchange. Whether practical or not, it is worthy of consideration, but if any scheme should take shape, it seems to me it would be wise at first to limit its operations to distribution, or say to promoting the sale of our produce in India, England or elsewhere.

Currency.—The Report of the Committee will probably be issued in the course of the year. There seems little doubt that they will pronounce in favour of a fixed exchange and a future gold standard.

Roads and Communications.—Railways.—Sanction for the extension of the line from Arsikere to Hassan has not yet been received. The Durbar still appear to hold the construction of the line to the West Coast in contemplation, but what route and what gauge will eventually be adopted, and when it is likely to be commenced, are matters for conjecture only. It was announced in the *Madras Mail* some months ago that a company had been formed for the purpose of introducing *Light Railways* into the Province, and I addressed a letter to Government at the time urging them to support the project, but am without further information.

Roads.—I reported the bad state of the Mudigiri-Saklaspur road with special reference to that portion lying betwen the river and the Waddenhulla bridge, and immediate attention was promised. The Executive Engineer of the Hassan Division informs me that five miles of the Hanbal-Devarunda road have been traced, that the remainder will be done this season, and then the project will be submitted for sanction. Work has been resumed in a perfunctory manner at the north end of the Saklaspur-Chickanhully road after a most inconceivable delay, but the matter of compensation as regards some of the lands through which the trace passes is not yet settled (as is, I believe, the case with the Hanbal-Devarunda road) which might lead one to suppose that the Land Acquisition Act had been rescinded. The extension of this road to Chickmaglur was approved by the District Board, and an estimate has been called for.

Anjur Bridge.—I regret to say that the site has not yet been decided on, and that further delay in the construction of this urgently needed work is inevitable.

Post Office.—I have reported several cases of irregularity, but there has been no result whatever, and I have come to the conclusion that it is useless to attempt to expose P. O. shortcomings. Such a state of things is not creditable to the higher officials.

Police.—General inefficiency and dilatoriness on the part of the Police have not infrequently been brought to my notice during the past year. Of specific complaints, one is the delay in serving warrants, and the difficulties placed in the way of maistries and others sent with them. I have reported this, but can record no improvement. Another is the failure of Inspectors, Jemadars and Daffadars to visit estates during the picking season, and it is alleged in some quarters that even Constables fail to call on their beat. I suggest that a strong representation be made to the Inspector-General regarding the general inefficiency and unreliability of the Malnaad force. The horrible murder of a Baskull cooly, returning from Mudigiri after cashing notes, calls for prompt and intelligent investigation. I trust the perpetrators will be apprehended and convicted, for, if this crime should go undetected, as several of a like nature have done, lawlessness will run rife and a feeling of insecurity prevail.

Forests.—I have written the Chief Conservator of Forests to enquire if grants of land for cardamom cultivation have been made in the forests of Kubbenhully, Bisleh and Kemphully, and await his reply.

Local Officials.—At the request of certain members I have laid a serious complaint before the Deputy Commissioner against the officials of the Saklaspur Taluq Cutcherry, and an investigation has been promised. Great inconvenience has been experienced in the Belur taluq owing to the Amildar not being invested with second-class powers. I have urged these being given, but sanction has not yet been received In important taluqs of this description it is essential that high-grade Amildars should be appointed on whom there need be no hesitation about conferring such powers.

Medical.—As soon as the authorities are less occupied with plague, the matter of a European doctor in Chickmaglur should be taken up, and a scale of fees to be charged by Medical officers of all grades in the District be submitted to the Senior Surgeon. The Civil Surgeon has promised to provide accommodation for in-patients in Saklaspur and Mudigiri hospitals.

Members.—Messrs. Stewart, Woodbridge, Daly, H. M. Playfair and C. F. deSalis have resigned, and Mr S. J. Wilson has joined the Association.

Accounts—are laid on the table and show a balance of Rs.287-9-0 at credit. I beg to place the resignation of my office in your hands, and as I shall be going home in April, do not offer myself for re-election.

The Report having been unanimously adopted, Mr. Graham Anderson, C.I.E., then made the following remarks :—

Gentlemen,—I feel sure that every planter in Southern India is rejoiced to find that, after nearly 30 years of negotiations, the Govern-

ment of India has been fully impressed with the justice of all that has been represented after studying the elaborate report of the Southern India Planters' Enquiry Commission. In due course the various Planting Associations of Mysore will doubtless have opportunities afforded of studying drafts of the improved legislative arrangements which are to be substituted for the unsatisfactory and unintelligible laws which have hitherto existed and which have frustrated the objects for which their provisions were specially extended to the Planting Districts, by encouraging unscrupulous individuals to become dexterously dishonest. We in Mysore are specially gratified to learn that the beneficial influences calculated to result from the peculiarly favourable position of the Mysore Province, which is entirely surrounded by the territories of the Paramount Power, will in the future cease to be neutralised by the absence of equitable and reciprocal facilities for the execution of warrants and extradition We feel sure that sympathetic consideration will be bestowed on all arrangements which will be made for this Province in which the conditions under which industries are conducted differ considerably from those existing in Ceylon, Assam and other Planting Districts. We may feel perfectly confident that, in consultation with the Durbar, the Government of Madras will not experience any insurmountable difficulty in arranging for the maintenance of cheap, prompt and efficient justice as between man and man, be he employer or employè, and that with the clearly defined object of restraining unscrupulous individuals nothing will be permitted which be distasteful to those who have constant congenial employment always to offer, or which will in any way unduly sacrifice the freedom and best interests of hundreds of thousands of the labouring peasantry upon whose welfare and work the developments of industrial success entirely depends.

The accounts were audited by Messrs. Butcher and Lake and passed.

The Proceedings of the last General Meeting were then confirmed and signed by the Chairman.

U. P. A. S. I. Subscription.—Resolved that the amount to be subscribed be left to the discretion of the Committee.

U. P. A. S. I. Delegates.—Messrs. Graham Anderson, C.I.E., G. Horne, and W. L. Crawford were elected.

Honorary Members.—Carried by acclamation that the Deputy Commissioners of Hassan and Kadur, the Sub-Divisional Officer of Saklaspur, and Mr. G. E. Ricketts, Assistant Conservator of Forests, be invited to become Honorary Members.

Postal.—Proposed by Mr. J. Crawford and *seconded* by Mr. Playfair that the Association urge the authorities to retain the P. O. at Bellagode.

Committee.—The present members were re-elected.

A vote of thanks to the retiring Honorary Secretary was proposed by Mr. R. A. Anderson in the following terms and unanimously carried:—

"We are about to say good-bye for a time to Mr. Harris, our Honorary Secretary, who leaves shortly to enjoy a well merited holiday in England I feel sure I merely give expression to the sentiments of all my brother planters when I venture to wish him and Mrs. Harris a most pleasant voyage and every possible pleasure and happiness among other friends and relations at Home. Mr. Harris has performed the duties of Honorary Secretary of our Association for several years past, and has won the esteem, regard and gratitude of our community for his devotion to his work, his proverbial courtesy and the untiring energy with which he has maintained the usefulness of this Association. During his term of office he has had to deal with many most difficult subjects, and whether we remember his speeches or peruse his written communications, we cannot fail to admire him as a most tactful and painstaking man of business in every way worthy of the unqualified confidence which he has always enjoyed. I feel perfectly sure that the successes which have been achieved during the period of his incumbency may, in a very large measure, be attributed to the prudence and skill which have at all times characterised the negotiations which it has been his duty to conduct for the maintenance and improvement of planting interests generally. I beg, therefore, to propose a most cordial vote of thanks to Mr. Harris, and to assure him that we one and all most highly appreciate the valuable services which he has rendered during his tenure of the office of Honorary Secretary to this Association."

Mr. Park was elected President and Mr. Playfair Honorary Secretary.

A vote of thanks to the Chairman closed the Proceedings.

HOW IT IS.

In the streets of the town where I live I sometimes meet a poor fellow who is so badly off that his appeal for a penny or two is hardly to be resisted. He has lost both his legs above the knees and punts himself along the pavement with his hands, like a loaded barge in shallow water. Thank Mercy, one doesn't often see human hulks like him. Where there is a single instance of a man having lost both legs or both arms there are a dozen where only one limb of the pair is missing. And where there is a single case of the latter sort there are a hundred cases of people who are lame, or more or less disabled, by disease or minor injuries which are scarcely noticeable, yet in the long run very serious to those so afflicted.

Consequently, when we sum up both classes we perceive that it isn't the total wrecks and the incurables that are most expensive to society, but the prodigious host which *must* work, and *does* work, yet always under difficulties and against hindrances. Men and women regularly employed, but who are continually breaking down in a small way, thus losing fragments of time and fractions of wages, are of the kind I mean. The amount of income lost in this way in one year in England is immense. And so far as the cause of all this is *disease*, and not accident or born bodily imperfection, it is almost always preventible and generally curable. Look at this, for example, and take heart.

"In the spring of this year, (1897)," the writer says, "my health began to fail me. My appetite was poor, and after meals I had pain and weight at the chest. I could not sleep owing to the pain, and I got weaker every day. I had so much pain that I dared not eat, and rapidly lost flesh.

"I was in agony night and day, and often sat by the fire at night as I could not rest in bed. I had a deal of muscular pain, particularly in the arms. I gradually got worse and worse and in two months, *lost two score pounds weight.*

"I saw a doctor who gave me medicines and injected morphia to ease the pain; but I was no better for it. Then I met with a friend who told me of the great benefit he had derived from the use of a medicine called Mother Seigel's Syrup. I got a bottle of it from Mr. S. Richardson, Chemist, Bridgman Street, and in a week I could eat well and food no longer distressed me. Therefore I kept on with the medicine, and soon was strong and well. I am now in the best of health and recommend this remedy to all I meet with. You are at liberty to publish this letter as you like."—(Signed) William Bridge, Grocer and Baker, 65, Bridgman Street, Bolton, October 5th, 1897.

Here we have an illustration of the proposition with which this article sets out. From Mr. Bridge's account of his own case we see that he lost a considerable time from his business. How much that represents in money he does not say; nor is it important to the argument. For two months or more he lost from his business practically all he was worth to it; and what that situation would have signified, had it been indefinitely continued, any intelligent person can imagine. Men frequently become stricken with poverty as with illness in that way. However well any business may be managed in an emergency by others, it is not to be supposed that it gets on as prosperously as when the proprietor is himself at the helm. And he cannot be there while he is suffering agonies from disease. This is true even if we make no calculation of the direct expenses created by illness, nor of the suffering experienced—the latter not computable in terms of money.

Now, please remark how quickly Mr. Bridge was cured of his ailment—bad as it seemed and really was. Dating from the time he began using Mother Seigel's Syrup, he says:—"*In a week* I could eat well, and the food no longer distressed me." His trouble was of the digestion only (acute dyspepsia), for which this preparation long ago proved itself a specific. Had he known of and employed it when the attack began he would have lost no time, felt no pain.

The lesson of the case is this:—As indigestion is a common complaint, and dangerous also when neglected, the remedy should be at hand for immediate use when needed. The more valuable the treasure the more strict should be the guard over it. And health is a jewel compared with which rubies are as the glass beads of savages.

MARKET REPORT.

By Mail advices of 21st April, 1899.

COFFEE.

The *London Commercial Record* says:—The pressure of sales continues and many catalogues have been compelled to be postponed in consequence of the heavy supplies at auction. The market, however, has for the most part exhibited a firm tone, and all good colory qualities have met a fair demand at full prices, but undesirable descriptions of all growths are as difficult to move as formerly. There have been some slight fluctuations in "futures," which close quietly at a slight decline, viz.:—

London	... Santos	... July delivery	... 28s 3d
New York	... No. 7 Rio...	„ „	... 5.15 cents.
Hamburg	... Santos	... „ „	29 pf.
Havre	... Santos	... „ „	... 35 francs
Holland	... Good ordinary Java	..	... 27¼ cents.

Imports, Deliveries and Stock of Coffee in London are as follows:—

	Stock.		Imports.	
	1899.	1898.	1899.	1898.
Tons ...	17,176	13,255	13,565	14,379
	Home Consumption.		Export.	
	1899.	1898.	1899.	1898.
Tons ...	4,556	4,352	6,238	6,369

The preceding figures exhibit—

In the Imports a decrease this year of	8,014	tons.
Home Consumption an increase of	204	„
Export a decrease of	131	„
Stock an increase of	3,921	„

The details of this week's auctions are as under:—

Ceylon.—*Plantation.*—21 casks 6 tierces 12 barrels mostly sold—smalls 45s to 69s, low medium brownish 72s to 86s, bold ditto 89s to 93s, low middling greenish 96s, bold 105s, pea-berry 97s.

East India.—2,678 bags partly sold, as follows:—*Mysore* smalls 37s to 63s 6d, low middling 47s to 56s, good middling blue 78s 6d to 83s 6d, fine bold blue 101s, pea-berry 85s to 95s. *Coorg*, smalls 37s 6d to 46s, low middling to middling 46s to 58s 6d, good middling 66s 6d, good colory bold 81s to 88s 6d, pea-berry 84s 6d to 94s 6d. *Neilgherry*, smalls 37s 6d to 43s 6d, low middling to middling 43s to 52s 6d, good middling 65s 6d, bold 68s to 74s 6d, pea-berry 60s to 86s. *Wynaad*, pea-berry 80s 6d.

Jamaica.—194 barrels, 224 bags mostly sold, ordinary to fine ordinary greenish 29s 6d to 36s 6d, ordinary brownish 30s, low middling brownish to middling colory 44s to 51s 6d, pea-berry 45s.

Costa Rica.—9,783 bags mostly sold, smalls 28s 6d to 55s 6d, ordinary to good ordinary greenish 34s to 38s, fine to fine fine ordinary 39s to 46s 6d, low middling to middling 47s to 59s 6d, good to fine middling blue 61s 6d to 75s, good to fine bold blue 77s 6d to 100s, very fine 106s 6d, pea-berry 46s to 106s 6d.

Guatemala.—1,001 bags nearly all sold, smalls 27s 6d to 29s, good ordinary grayish 37s. middling colory 48s 6d to 49s, good middling colory 58s to 60s, good bold 67s to 70s, fine ditto 80s to 84s, pea-berry 72s to 80s.

Colombian.—1,548 bags mostly sold—smalls 28s 6d to 43s ordinary grayish mixed 30s, ordinary to good ordinary greenish 30s to 35s 6d, low middling to middling 45s to 55s, good middling colory 56s to 60s, dull green bold 65s to 68s, good dark green to fine colory 70s to 86s, very fine 93s 6d, pea-berry 54s 6d to 78s.

Salvador.—695 bags sold—fine ordinary foxy green 34s, fine fine ordinary greenish 40s 6d to 43s, low middling gray 45s, middling dull greenish 47s to 50s 6d, good middling 54s to 58s 6d, pea-berry 52s 6d to 62s.

Ecuador.—52 bags sold—good ordinary yellowish foxy, country damaged, 29s 6d.

Mexican.—Of 1,001 bags a good proportion sold—ordinary to good ordinary 27s to 33s, fine to fine fine ordinary 39s to 44s, middling to good middling 48s to 64s 6d, fine middling blue 66s 6d to 74s, good to fine bold 74s to 79s 6d, very fine 80s to 96s 6d, pea-berry 80s to 96s 6d.

Peruvian.—43 bags retired.

Nicaragua.—62 bags sold, low middling to middling 43s 6d to 50s 6d, pea-berry 64s 6d.

Venezuelan.—Of 140 bags offered a few bags low smalls sold at 27s 6d.

Brazil.—62 bags Santos bought in.

Receipts in Rio and Santos.

Since July 1—	1898-9.	1897-8.	1896-7.	1895-6.
Rio	2,732,000	3,804,000	3,083,000	2,023,000
Santos ...	5,008,000	5,680,000	4,678,000	2,783,000
Total ...	7,740,000	9,484,000	7,761,000	4,806,000
Crop	—	10,461,000	8,680,000	5,489,000

Rio Exchange 7d, previous day 7d.

Havre, April 20.—Santos good average April opened steady at 34½f. and closed steady at 34¼f., May opened at 34½f. and closed at 34½f.

Hamburg, April 20.—Good average Santos April opened steady at 28½pf. and closed quiet at 28¼pf., May opened at 28½pf. and closed at 28½pf.

New York, April 19.—Closing prices of No. 7 Rio were as follow:—

	April	May	June	July	Aug.
April 19 ...	5.00	5.00	5.05	5.15	5.25
April 18 ...	4.95	5.00	5.10	5.15	5.25

The parcels offered to-day comprised:—2 casks 16 tierces 15 barrels 3 bags Plantation Ceylon, 1,533 bags East India, 153 half-frazils Mocha, 15 barrels 72 bags Jamaica, 705 bags Guatemala, 810 bags Salvador, 2,714 bags Costa Rica, 218 bags New Granada, 267 bags Colombian, 89 bags Mexican. The sales were not finished until late. Good qualities sold well, common grades dull of sale.

IN AMERICA.

The March deliveries of Brazil were very heavy, reaching 549,588 bags, against a monthly average. July to March inclusive, of 372,209 bags, and larger than for any month since April, 1898, when the deliveries were swelled by withdrawals in anticipation of a duty being levied. Last week's deliveries of Brazil were 117,914 bags, of which 114,977 bags were from this port, against 81,159 bags same time last year. Full details of the movement will be printed in our next issue.

The market has ruled steady for Brazil sorts on the basis of 6 1-16c for No. 7 Rio. Mild sorts firm for high grade coffees, which are not in abundant supply. Padang Interior, 24½@25¾c, with fancy mats at 32@34c. Mocha, 19@21c. and better for fancy lots. Good Cucuta, 8½c, and if strictly up to grade, better, with fancy Maracaibo scarce and commanding full prices—say, 14@15c.

Prices realized at auctions in London for some of the principal marks of East India:—

TEA.

CHINA.—The better demand noticeable last week has quite disappeared, the enquiry proving very poor, even at lower prices. Auctions have offered 3,335 packages, of which about half sold as under:—

boxes new make Congou 8d.
boxes Scented Siftings 5¼d.
half-chests Moning 8d to 9½d.
half-chests Souchong 7d to 8d.
half-chests Kaisow 7½d.
half-chests Oolong at 6d to 8¾d.
boxes Caper 7¾d to 8¼d.
boxes scented Orange Pekoe 7½d to 7¾d.
boxes Foochow Pekoe 7½d to 8d
boxes Souchong 7d.

INDIAN.—Rather heavier auctions took place on Monday, totalling 24,400 packages, compared with 22,600 packages in the preceding week and 22,800 packages a year ago.

A quieter tone pervaded the market, partly due to the amount of money absorbed by excessive duty payments made in anticipation of the Budget declaration. Some influential buyers were therefore not operating, while others were only disposed to purchase at a concession in price. Importers, however, deemed the position sufficiently strong to warrant them in handling their tea with firmness and a large proportion was withdrawn. Considerable irregularity was noticeable in the bidding, and where sales were made a decline of ¼d to ½d per lb. was in many cases established, particularly for Pekoe Souchongs and inferior Pekoes. There was not much change to note in the better liquoring descriptions over 9d per lb., though a firmer tendency was occasionally displayed for full flavoured Assams and Darjeelings.

For 17,800 packages on estate account 10d per lb. was obtained contrasted with 8d per lb for 16,100 packages in 1898.

CEYLON.—Catalogues comprised 27.200 packages, versus 29,600 packages on the 11th inst., and 28,200 packages at the corresponding time of 1898.

For the reasons above mentioned, and also in consequence of the rapid rise during the past three or four weeks in the value of common to fair, business received a check, and dealers shewed reluctance to add to their stocks, while owing to the Easter holidays in Russia there was also a paucity of Continental orders. Under these circumstances a decided drop in quotations took place, leafy kinds below 8½d per lb. marking a fall of ¼d to ½d in most instances, and from that figure up to 1s per lb. the majority of parcels ½d to 1d per lb. A good number of the breaks, which were bought in owing to the low offers made in the room have been placed privately since at an advance. Finest were not so much affected, among the best being the following:—Flowery Pekoe, Mount Vernon 1s 8¼d; Broken Orange Pekoes, Henfold 1s 5¾d; Talawakelle 1s 4¼d; Diyanilakelle and Valamaly 1s 3d; Wootton, 1s 2¾d; St. Clair 1s 2½d; Silver Kandy 1s 2¼d per lb.

The average is 8⅝d per lb. On the 13th inst. it was fractionally over 9d per lb., and slightly above 7½d per lb. on the 28th April, 1898.

JAVA.—Nearly 1,700 packages of direct import passed the hammer, several favourite marks being represented. There was a steady all-round enquiry and these growths did not appear to be so adversely influenced as others. At present only about 400 pkgs. are advertised for next week.

Deliveries.—The clearances of all tea (on which duty has been paid) from the London warehouses, as per official returns, were—

From 1st to 18th April, 1899 ... ... *16,644,886 lbs.
„ „ 1898 ... ... 9,322,310 „

During the week the following have been printed for sale by public auction:—

	Sold.	Withdrawn	Total offered.
	Pkgs.	Pkgs.	Pkgs.
India	17,300	7,147	24,447
Ceylon	21,471	5,741	27.212
Java	1,605	75	1,680
Total ...	40,376	12,963	53,339

Also 444 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated April 21st, 1899, states:—

QUANTITY BROUGHT TO AUCTION IN LONDON
FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1898-1899 ...	1,505,623 pkgs.	999,833 pkgs.	42,943 pkgs.
1897-1898 ...	1,470,759 „	1,048,134 „	38,740 „

25,732 pkgs. Indian
27,309 „ Ceylon
1,680 „ Java
} Total 54,721 packages were offered in public auction this week.

Indian. The sale passed off with a quieter tone and prices for all grades were slightly weaker, many Teas in consequence being taken out of the sale owing to the firmness of importers. The official wire from Calcutta gives exports to U.K. for the first half of April as 73,000 lbs., against 56,000 lbs. during same period last year. 235 closing invoices have been sold in public sale as against 191 at the same date last year. The following averages are worthy of note:—"Ass. Co. Towkok," 1/3; "Goomtee," 1/2¼; "Ass. Co. Doomur Dullong," 1/2; "Runglee Rungliot" and "Singlo Tea Co. Jaboka," 1/1¼.

Ceylon. With two consecutive weeks of heavy auctions and a considerable amount of Tea trade money locked up in duty payments the market gave way fully ½d. per lb. on Teas for price and as much as 1d. on some of the better liquoring parcels. After the sale, however, there was a stronger demand, slightly better rates being obtained for some of the withdrawn lots. Private Telegraphic advice gives exports to U.K. from 1st to 15th April as 3,200,000 lbs., against 3,100,000 lbs. same time last year, and estimates the quantity available for month as 7½ million lbs.

Average for week 8·57d., against 7·54d. last year.

Java. The Javas were mostly sold, although prices were not quite so good as last week.

Bank rate 3 per cent. Exchange on London three months sight:—Calcutta 1/4 1/16. Colombo 1/4 1/16.

IN CANADA.

The market for Indian and Ceylon descriptions continues to gather strength rather than lose it. In consequence of the gradual reduction in stocks held by brokers, the local market is stronger, and teas that only a short time ago were offered at 13 to 13½c. could not now be obtained under 16c., and there is nothing in London that could be laid down on this market at less than 8½d. per lb. The demand for teas, the brokers report, is not as brisk as it was, but there is still, however, quite a little business being done in spot teas, and a little in London teas at from 18 to 25c. The chief demand, however, is for teas which can be obtained at about 15c., but teas at this price are practically unobtainable. There are some teas in second hands which can be obtained at 16 to 17½c., according to quality.

IN AMERICA.

Invoice and line trading quiet, with the market well held on medium and low grade tea.

COCOA.

7,084 bags were catalogued at yesterday's auctions. These met with a slow demand, only about half being disposed of at 1s. decline for Trinidad, 6d. decline for Grenada. Of 2,481 bags Ceylon only 980 sold at about steady but irregular prices.

We quote—Trinidad, middling to fine red 72s. to 76s., gray and mixed red 69s. 6d. to 71s. 6d.; Guayaquil, Caraquez 70s. to 71s., Arriba 71s. 6d. to 82s; Ceylon, middling to fine 67s. to 80s. Stock 111,149 bags, against 130,927 bags last year.

* Including payments made in anticipation of the Budget announcement.

PEPPER.

Black.—The market this week has been quiet but firm, and about 100 tons Singapore have been sold for arrival at higher prices—at 5¼d January-March and May-July shipment and at 5 9/16d June-August. On the spot sales of fair Singapore at 5¼d.

Auctions on the 19th inst. offered 500 bags Penang, and 200 bags Aleppy, which retired at 5d. and 5¼d respectively. 160 bags Tellicherry sold prior to auctions

The shipments of Black Pepper for the first half of April compare as follows:—

		1899.		1898.
U.K.—Sing.	20	60	*nil*	460
„ Penang.	40		460	
Continent		70		*nil*
United States		240		*nil*
Total tons...		370		460

White is also firm, and about 50 tons have been sold for arrival, including Singapore May-August (s.) at 8 9/16d. to 8⅝d. and Penang June-August at 8d. On the spot sales of fair Penang at 7 13/16d. per lb.

At public sale on Wednesday 43 bags Singapore and 46 bags Siam were bought in.

The shipments of White Pepper for the first half of April compare as follows:—

		1899.		1898.
U.K.—Sing...	20	60	70	150
„ Penang.	40		80	
Continent		20		*nil*
Total tons....		80		150

GINGER.

Cochin.—Offerings continue heavy, but great difficulty is experienced in getting reasonable bids. Catalogues comprised 342 cases 1,121 bags, but only 21 cases 120 bags sold under the hammer at 48s for medium and boldish roughly cut limed, 26s. for dull cut tips, and 24s. 6d. to 25s. for brownish washed ends, 17s. to 17s. 6d. for cuttings. and 17s. 6d. per cwt. for brown rough D's. All these prices, except for cuttings which weresteady, show a material decline.

Japan.—20 bags dull limed bought in at 19s per cwt.

Jamica.—251 barrels catalogued, and about 160 barrels sold as follows:—very bold branchy plump hard washed 106s to 107s 6d, fair to good bold and medium washed 73s to 80s, fair medium plump, part lean, 67s to 70s, good ordinary 62s to 66s 6d, Rhatoon 60s to 62s per cwt., showing a movement in buyers' favour.

INDIA RUBBER.

The market for Para is easier, with sellers of fine at 4s 3d per lb Scrappy negroheads have been sold at 3s 5½d per lb.

At auction to-day there was very little demand, and the greater portion offered was bought in; what sold realized rather lower prices.

Peruvian.—51 packages offered and 10 sold, fine at 4s 2d. entrefine at 4s 1d, negroheads at 3s 4d per lb.

Colombian.—15 bales sold, crinkly strips rather coarse and dirty at 3s 3½d to 3s 4¾d per lb.

Central American, Carthagena, &c.—180 packages offered and only 22 sold, pale clean scrap at 3s 5¼d, good scrap at 3s 5d, rather soft scrap at 3s 2¾d, clean pressed strips 2s 6d to 2s 7d.

Penang.—22 pkgs. offered and 1 sold, inferior pickings 1s 0¾d per lb.

Borneo.—5 pkgs. offered and 2 sold, good, a little mixed at 2s 0½d, inferior dead at 1s per lb.

Mangabeira, 37 pkgs.; Madagascar, 22 pkgs.; Mozambique, 56 bags, and Rangoon, 57 bags retired.

CARDAMOMS.

Business is reported in most qualities this week at prices paid in auction.

The shipments from Ceylon for the week ending March 28 were 17,173 lbs., of which 16,433 lbs. were sent to London. The total exports from January 1 to March 28 have been—

	1899.	1898.	1897.	1896.
Lbs. ...	158,361	134,116	130,592	88,186

CINCHONA.

As announced last week, the Amsterdam auctions on May 4 will be very small, and, supplementing the particulars there given, we may state that the total weight of the 4,639 packages (consisting of 253 bales and 82 cases Government culture and 3,748 bales and 556 cases private bark) is 396,541 kilos., divided as follows:—Ledgeriana, 28,924 kilos., succirubra, 5,681 kilos. Of the private bark (weighing 361,936 kilos.) 268,179 kilos. are Ledgeriana, 76,988 succirubra, 16,252 hybrid, 300 Calisaya, and 217 kilos. officinalis.

The exports of bark from Java for the first half of April amount to 585,000 Amsterdam lbs., which is slightly above the average.

The Ceylon exports for the week ending March 28 were 8,504 lbs. shipped to London. From January 1 to March 28 the shipments have been—

	1899.	1898.	1897.	1896.
Lbs. ...	150,080	167,533	126,640	115,038

QUININE.

Has passed through a dull week, and prices in second-hand have declined fully 2d. per oz. At the close of last week business was done to the extent of some 70,000 oz, including spot or May delivery at 1s. 4½d. to 1s. 4¾d., and June 1s. 4¾d. to 1s. 5d., but mostly August at 1s. 4d. to 1s. 6d. On Saturday the market was further depressed, in consequence of the good report from Java regarding the bark shipments, half of April being returned at 585,000 Dutch lbs. This week opened dull at easier prices, the small business done on Monday comprising spot at 1s. 4d. and May delivery at 1s. 3½d. to 1s. 4d. On Tuesday there was a further decline to 1s. 3d. spot or May delivery, but little business was done. There was a "bear" rumour on 'Change on Tuesday that makers had reduced their price to 1s. 3d., but it proved to be without foundation. Yesterday the speculative market improved somewhat, and 1s. 4d. was paid for August, and there were no willing sellers of spot stuff at 1s. 3½d. until the close, when 1s. 3d. was the price for prompt or May. To-day the market is flat and unchanged. The week's turnover is about 200,000 ozs. There is considerable doubt as to what the maker's next move will be. Much depends upon how the bark-sales go in London next week and in Amsterdam in May. It is not expected that the present unit will be maintained, but the holders of cinchona now hold the key of the situation.

In their periodical report Messrs. Gehe & Co. have something to say regarding the speculative movement and appreciation in the value of quinine. We quote from their remarks, not so much owing to their originality, but as showing that the opinions are similar to those that obtain in England and America:—"The upward tendency has arisen from a justifiable view, but it must be borne in mind that we may have strayed all too far away from really firm ground. Present circumstances are not new, but have, on the contrary, very often arisen. In every crisis a time arrives when an outside attack causes a psychological change, but it has always happened that when it was hoped the price position had reached its height, fate caused another downfall. This is to a certain extent due to natural circumstances, as a higher rate of production leads to more of the material being introduced into the market, which again lowers its worth. Last year the prices of quinine were raised from the low position into which they had fallen in 1897, and it would be a great pity if, through want of due care, it were allowed to be dragged down again."

(Average for all India 9·87d.) *April 21st.*

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittance, should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday the 26th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Coorg.

Polli Betta, *16th May—Weather.*—"The rain, it raineth every day." It rained on two days early last week; again on Sunday the 14th; and last night, it rained nearly all the night. This morning broke quite dull and monsoonish. Some fine weather would be welcome. *Crops*—It is feared that the rain on the open blossom has done a great deal of injury. The berries of the last set are showing up better now; but prospects are not very bright. *Labour.*—A feature of the season is that labour, especially for the time of year, is very abundant. *Works.*—Manuring is nearing completion. Destroying borer and supply holing are now in hand. *General health.*—Good.

COFFEE IN QUEENSLAND.

II. Picking, Curing, &c.

In our last paper we referred to the experiences of Mr. T. A. Bromley in the cultivation of Coffee in Queensland, supplementing them by a few observations of other planters in the same colony. Advancing a step in the matter of preparation for market, we arrive at the picking stage, a not unimportant one, especially in districts where labour-supply is scarce. Mr. Bromley is in the happy position of having a big little family to help him, and of being able to get children from roundabout to help him. He declares that children are by far the best pickers, and does not think "a coloured man" will ever make a good coffee-picker, though he admits utter ignorance of the Tamil. Making a practical test of his own capabilities, he set to work in the morning as soon as he could see, picked for all he was worth until breakfast, returned from that meal and worked till mid-day. After dinner went on picking again. Taking the field all day he had 110 lbs. of cherry as a result, or

nearly two bushels. He heard that a Tamil can pick 2½ bushels a day, but considers that "if he does, then an overseer would have to go behind him." Mr. Bromley's yield has been from 18 to 20 per cent. of berry to cherry, and he reckons that 12 per cent. is lost in the parchment. Working on these figures, and a local price of 9*d.* per lb. for parchment, he estimates the value of the finished berry at 10*d.* or 10½*d.* and deducting 3*d.* per lb. per cost of picking, sets the value at 7*d.* per lb. Before leaving this question of picking, we may observe that aboriginal "boys" have been tried on the Hambledon Plantation. At ½*d.* per lb., the price paid to aboriginal pickers, it was found that a man who worked steadily could average about 3*s.* 3½*d.* per day during the height of the picking season; but allowing for lesser gatherings in the early and late portions of the crop time, this is reduced to 2*s.* 6*d.* per day. Mr. E. Conley, Manager of Kamerunga State Nursery, has reckoned on this basis that this expenditure of 2*s.* 6*d.* results in a surplus of 5*s.* 11*d.* to the planter, out of which surplus "has to come the cost of clearing, planting and cultivation of the land, interest on outlay for over three years, cost of manufacture, interest on outlay for machinery, cost of bags, cartage, freight, insurance, commission, and a few other sundries." These figures were modified later, however, when it was stated that the price agreed upon for the work was 3 lb. *of coffee for* 1*d.* The total crop gathered amounted to 25,741 lb. 12oz. On the average there were 10 boys in the field per day for about 40 days, and they earned about 1*s.* 9*d.* a each, picking a little over 64 lb. cherry each.

These calculations have led us past the pulping and curing stage, to which we must now revert. Mr. Bromley's description of his search for truth in this direction is instructive. He had, in the first place, to make a pulper for himself. He made one on the lines of what is known in Ceylon as a rattle-trap, and it has answered well up to the last season, enabling a man and a boy to put through about 30 cwt. of cherry per day. Mr. Bromley had no one to teach him anything about pulping, fermenting or drying. He got a book from Ceylon, which gave him some good hints, and eventually he evolved this method. He pulps, and puts the pulped berries into a large wooden barrel cut in halves. The fermenting generally takes from thirty to thirty-six hours. He had read of barbecues, but thought them too expensive for his small outturn So he first levelled off a piece of land, covered it with cotton sheets, and put the parchment on these; but he could only dry from the top and the process was not quick enough. He then built rough tables, drove stakes into the ground, nailed transomes across them, and in the opposite direction nailed small battens. On these he spread the sheets, and the coffee on the sheets. In the fourth year he improved upon this. He made a great number of trays of 3-inch battens and sheets of perforated zinc 7 ft. by 3 ft. These latter he cut exactly in the middle, and made frames of the battens just large enough to take one of the half-sheets of zinc. He secured the zinc to the battens by means of smaller fillets and sticking into them a strong tough bar of wood to prevent a sag in the zinc. Then he made tables again, about 2 or 3 feet above ground, and laid the trays on these. He found natural sun drying perfect so far as it goes, but his difficulty was to tell when the parchment was sufficiently dried. Sometimes he overdried, with the result that the berry lost its shape. Then he went to the other extreme and removed the berry before it was properly dry. Though it did not deteriorate under these circumstances, it would not harden. Eventually he found out that the berry changes colour slowly from greenish gray to a slaty blue, and that as long as he could see through the berry outer covering that it was not dry enough, he watched for that change. Before the berry lost its shape he bagged it. Another amateur coffee-planter, with only an amateur mechanic's tools and workshop at his disposal, made his own pulper, husked and "silver-skinner" The description of this last is as follows:—"Simply a large wheel, the rim of which is built of straight, and not curved, sections. The rim is tubular, and in this space the berries bearing their silver skin find a place. The wheel is then set in motion, and the chafing of one berry against the other, and against the sides of the tubular rim, removes the silver coating.

With men of this stamp to push it forward coffee cultivation in Queensland should have a fair chance of success. At present the colony does not grow enough for its own requirements. Well, therefore, may our Queensland friends think prospects hopeful. The latest remarks before us on this point are as follows:—"That Queensland is eminently suited for successful coffee-planting, no one can now doubt. The industry has grown beyond the experimental stage, and now it is only a question of good management and economical working of the plantations. Mr. Newport, the Government Expert, will no doubt succeed in his work of instructing planters in the most up-to-date methods of planting and curing. There is no leaf disease here, the climate and soil are adapted to the plant, and, if there be any difficulty, it will be in harvesting, owing to the present scarcity of pickers, but this is a matter which, like all other problems in agriculture, will settle itself as the occasion arises."

THE DEPRESSION IN COFFEE.

In publishing the annual report of the Nilgiri Planters' Association—which reached us just too late to be inserted in our last issue—we would call attention to the gloomy tone of the remarks on Coffee. The remark that chiefly calls for notice is this:—"One thing is certain, that coffee planters must reduce all expenditure to the lowest possible level if they are to pay expenses, with present prices." With this we do not agree. If Nilgiri coffee planters reduce all expenditure to a minimum, they may rest assured that present prices will not continue: rates will sink nearer and nearer the level of values of Brazilian coffee. Though in many cases the superiority of India coffees is now only in *name*, the reputation still clings, and prices rule higher than prices of Brazils. But if the quality continues to deteriorate as it has done of late, we shall soon have a new state of affairs to deal with. On the other hand, if by judicious manuring or improved cleaning and curing the quality of Indian coffee can be raised to its old position, there need be no fear but that prices will recover. The very report under notice comments on the fact that throughout the year "a very few really fine marks of E. I. coffee" have, to a certain extent, maintained their values. The question is not, shall India turn out superior or inferior coffee, but shall it turn out superior or *none*? In inferior grades it cannot hope to compete with Brazil, which can

produce much more largely and at a lower cost. It seems to us that improved cultivation (including manuring), improved curing, and improved methods of placing on the market are the points to which coffee planters in India should pay the most attention. Naturally, too, they must endeavour to obtain the maximum of good results at a minimum of expenditure.

THE INDIAN TEA ASSOCIATION.

Some interesting extracts from minutes of the proceedings of a recent meeting of the General Committee of the I. T. A. are given on another page. The fact that Mr. Blechynden's work in the States was put a stop to "without reference to India" is significant. If India, which provides the money, is not to be consulted on points of such importance as this, she will no doubt begin to consider whether she should continue to tax herself as heavily as at present The remarks on the Paris Exhibition show that money is to be spent in giving Indian tea prominence there. So far, the U.P.A S.I. does not appear to have arrived at a decision as to how far it will be prepared to invest some of its reserve fund for the same purpose. Exhibitions are always expensive and though the indirect profit is sometimes great, exhibits rarely result in a direct gain to the exhibitor. It will be seen that Government is to contribute towards the cost of a scientific officer for the tea districts in the North. This is a decided step in advance and should lead to the early drafting of a definite plan of action. It is a great pity that something similar cannot be done in the South, where the need of scientific aid is repeatedly felt. Mysore will no doubt get along all right now, but remote Travancore is not so well off, and even on the Nilgiris, the Shevaroys and the Pulneys but little assistance can be expected from the Mysore Agricultural Chemist, however willing his Government may be to lend his services, or he to give them.

GOVERNMENT AND CINCHONA.

The *Madras Mail* of 17th instant contained the following note:—"Mr. Standen, the Government Quinologist, Madras, has been deputed to visit Java to study the system of planting cinchona and of manufacturing quinine there, and will be absent for some months. It is proposed by the Madras Government to considerably extend its cinchona plantations on the Nilgiris, and a large area has recently been cleared close to the Pykara Falls, which has greatly marred the beauty of part of the rocky valley through which the Pykara river falls between the Downs and the low country." The action of the Government is inexplicable. In the first instance, if Mr. Standen is competent to fill the appointment of Government Quinologist it should be unnecessary to spend public money to enable him to study the system of planting cinchona and manufacturing quinine in Java. It looks very much as if he were to learn his work at the expense of the State! Then, again, the Government has no more moral right to lay itself out as a cultivator of cinchona and a manufacturer of quinine than it has to start tea or coffee planting or to set up a sugar refinery or a sausage-making concern. If it is content to learn from Java, all may yet be well, for the Java Government has decided, *on principle* (note this!), to give up the cultivation of cinchona and transform the plantations into experimental gardens. Almost at the moment it has thus decided, a Madras official is being sent over to learn how to conduct work that the Government of Java has decided, *on principle*, to abandon. The protest of the planters of South India must be fresh in the memory of the Government of Madras, and we trust that that protest will be repeated, if the information as to contemplated extensions is correct. We trust also that the protest will be brought before Parliament, which is shy of giving support to State interference with private trade or industry.

COOLY CRIMPING IN SOUTHERN INDIA.

At a Committee Meeting of the Kanan Devan Planters' Association held at Munaar, Devikulam, on the 8th May 1899, Mr. H. M. Knight, in the chair, the recent issues of the *Times of Ceylon* containing correspondence with reference to the alleged crimping of 20,000 coolies from Ceylon for Travancore, and the whole of Mr. Davidson's correspondence with regard to Mr Martin's 40 coolies were laid before the Meeting and the following resolutions, the first proposed by Mr. Hedger, the second by Mr. Hunter, were unanimously passed:—

"That while expressing sympathy for those unfortunate Ceylon Proprietors whose Superintendents have been mislead by their Kanganies and the Editor of the *Times of Ceylon*, and while desirous of working in harmony with Ceylon Planters and having no intention of taking on any Ceylon coolies at present, the members of this Association emphatically protest against any attempt being made by Ceylon agitators to dictate to them as to what coolies they should employ or where they should come from."

"That this Association desires to express its strong disapproval of the action of the Editor of the *Times of Ceylon* in giving currency to false rumours without making any attempt to have them contradicted till he was written to by Mr. Fairlie, and having seen all the correspondence, this Association particularly desires to place on record its contempt and disgust with the untruthful editorial statements (as noted below) of that Journal in its issues of 1st and 2nd May and consider that perversions of this kind are calculated to degrade British Journalism in the East."

STATEMENTS REFERRED TO ABOVE.

(1) That this Committee having read the correspondence are satisfied that Mr. Martin's 40 coolies were refused by Mr. Davidson before anything was known here of the agitation in Ceylon.

(2) That no advice of any sort was tendered by Mr. Fairlie or any one else to Mr. Davidson with regard to the refusing of the coolies; and

(3) Consequently he did not cave in as alleged by the Editor of the *Times of Ceylon*, and refused the coolies because he thought he could lay the advances out to better advantage locally.

(4) In addition to the above mis-statements the Committee are satisfied that the Editor of the *Times of Ceylon* took no steps on his own initiative to contradict those false rumours, but circulated them freely, although he could have found out the facts in five minutes on application to Mr. Fairlie

(5) That Mr. Fairlie himself, in the first instance, wrote to the Editor of the *Times of Ceylon*, asking him if the rumours referred to Messrs Finlay Muir & Co in Travancore and thus put a stop to the agitation; for which this Committee tenders its thanks to Mr. Fairlie.

It was also recorded, to remove any doubt in the public mind, that Mr. Hunter had the issue of the 24th ultimo before him when he wrote his letter to the *Times of Ceylon*.

PARA RUBBER.

Mr. Consul Churchill tells the story of Pará Rubber, and gives many interesting details. The *Hevéa* tree is not conspicuous; it is like an ash and requires 15 years to come to maturity. It is found over an area of 1,500,000 square miles, all along the valleys of the Amazon and Tocantins into Perú and Bolivia. It blossoms in August and will not grow properly except in the forest. No one will be likely to trouble much about it unless he finds it ready at hand. Fifteen years is a long time to wait for returns. There seems to be no fear of the Amazon variety being exhausted, as it is reproduced by Nature on so vast a scale, but by then or even before some substitute will most likely have been invented. The richest rubber zones, says Mr. Churchill, are along the banks of the Southern tributaries of the Amazon, but in Matto Grosso the whole area of the head waters of the Paraguay has been shown to be nearly equally productive. We also read:—

A rubber collector's outfit is of the simplest, comprising a gourd, a clay bowl, a spoon or paddle, an axe and 'machete.' Thus equipped he selects a suitable spot and erects a small hut, where he stores the rubber and cures it at leisure. Having erected a hut and obtained the requisite equipment the collector proceeds to gather rubber and fuel. He leaves his hut, equipped with an axe and knife, a basket containing cups and clay as a gourd. He has to use the knife in order to cut his way through the undergrowth, and also to cut down a sapling occasionally to bridge a rivulet. At times he is knee-deep in ooze or up to his waist in water. On arrival at a rubber tree he chips away the rough part of the bark, makes a more or less smooth surface, attaches a cup, and makes a small gash above it for the sap to fall into the cup; and repeats this process in a line round the tree until he has attached five or six cups. Then he proceeds to the next tree and does the same. He continues this process until he has tapped from 60 to 150 trees. On the following day the gashes in the trees are made a little lower than those made previously. Some trees are far apart, but when comparatively close together a collector can attend to 120 or 150 trees in a day. Some collectors tap the trees in the morning and return to collect the sap in the evening; whereas others tap in the evening and collect in the morning. When the accumulation of rubber is sufficient—usually the collection of three or four days—the collector lights a fire in his hut, places the funnel over the fire, and ladles a thin coat of milk over the paddle and holds it over the smoke to coagulate; the process is repeated until a large cake has been formed To release the paddle from the cake it is necessary to make a slit on one side. The paddle mould makes a cake of uniform and even shape. The paddle is in general use in the State of Pará. In other parts a spit is placed on two upright forked sticks, and given a rotary motion. By this means the rubber is cured with greater ease. Paddle smoked rubber is preferred as it is drier and more carefully cured.

Many attempts have been made to introduce improved curing apparatus. Up to the present, however, they have not been received with popular favour, because the universal process, although very primitive, possesses the advantages of being simple and inexpensive.

The process of curing rubber is very injurious to the eyes. Many cases of total blindness result from it.

There are three grades of Pará rubber, fine, medium, and coarse. The best quality is classified as fine. If rubber is not uniform and contains impurities, it is classified as medium The coarse quality, or "Sernamby," consists of scraps that have not been cured.

An expert collector gathers 7 lbs. of rubber in one day in the Lower Amazons, but three times this amount is collected in the Upper Amazons in the rich parts.

The collecting season in the Lower Amazons begins when the waters have subsided—about July—and ends in January or February. Collecting is not undertaken as a rule in the wet season, because the quantity of water that accumulates in the forest impedes the movements of the collectors, and the rainwater that runs down the trunks of trees prevents the clay cups from adhering to the bark, and also because the sap is weaker in this season.

TEA AND COFFEE ON THE NELLIAMPATHIS.

In the Administration Report of the Cochin State for 1894-95 it was stated that the number of Coffee Estates on the Nelliampathy Hills remained the same as in the previous year: 19; the number of tea plantations—2—was also unchanged. The total yield of coffee was 479,460 lbs., or an average of 175 lbs. per acre: the total yield of tea was 4,028 lbs., the average yield per acre of mature plants being 70 lbs. In the previous year the average yield of coffee was about 450 lbs.; of tea about 369 lbs. per acre. In 1895-96 the yield of coffee increased to 316 lbs. per acre, that of tea to 105 lbs. In 1896-97 there was a very serious falling-off in coffee, the yield of which was only 70 lbs. per acre, while the yield of tea fell to 102 lbs. The figures for 1897-98 show a recovery in coffee, but a lamentable decrease in tea. They are as follows:—

	Coffee.
Plantations	19
Total area	8,502
Under mature plants	3,337 acres.
Under immature	287½
Total under coffee	3,624½
Average number of coolies employed permanently ..	295
Average number of coolies employed temporarily...	1,484
Total yield ..	350,176 lbs.
	Tea.
Number of plantations	4
Total area	67 acres.
Under mature plants	59
Under immature	8
Uncured leaf	16,000 lbs.
Manufactured	4,000

The violent fluctuations in the outturn of crops are not explained in the reports under notice.

NOTES.

Unprofitable. An American writer observes:—It does not pay to cultivate lands without returning necessary fertilizers and home-made manures.

Cooly Crimping in Ceylon. On another page we publish a vigorous protest of the Kanan Devan Planters' Association against the remarks and correspondence that recently appeared in the *Times of Ceylon* with reference to alleged crimping of coolies for employment in Southern India. Our contemporary's mare's nest will be remembered for years to come!

Sale of Ceylon Tea Estates. The Bunyan and Ovoco Tea Plantations in the Maskeleya district, Ceylon, containing 563 acres, of which 533 acres are under cultivation, were offered for sale at the Mart on 27th ultimo by Messrs. Farebrother, Ellis and Co., and knocked down to Sir Thomas Lipton at £25,000, including the plant and machinery and live and dead stock.

Brazilian Coffee. A Santos report dated 30th March 1899, says:—In Europe sales were made, as we hear, at 28s 3d c. & f. for *superior* April-May shipment. At the most favourable terms of both coffee and exchange markets of the week this price leaves no commission whatever and even a loss, if the seller, as we think, has to ship a Havre type. Receipts are very irregular, but show a decided tendency to fall-off.

The London Tea Market. In their weekly cable to Colombo Messrs Gow, Wilson and Stanton reported on 11th instant that the market was weak. Fair liquoring Ceylon Pekoe Souchong was quoted 7½*d.* and the average for the week 8¼*d*, both figures showing no change. The whole 21,000 packages of Ceylons offered were sold. Of Indians 12,000 were sold out of 16,000 offered, and the average is given as 9*d.* showing a rise of ⅛*d.*

Retailing Tea at a Shilling a Pound. At a meeting of the Liverpool and District Grocers' and Provision Dealers' Association on 17th ultimo the Chairman called attention to the fact that tea at 1s. and sugar at 1¼d. were being sold retail when they could not be bought at that price wholesale. He thought it was time to take steps in the matter. It was decided to send out a recommendation on the subject—to the effect, no doubt, that sales at these low rates should be discontinued.

Cardamoms. Cardamoms were one of the late Mr. Daniel Hanbury's favourite studies, his paper on the subject (*P.J.*, 1885) being historic. It is recalled by Mr. F. L. Lewton in the *Amer. Jour. Phar.*, who has found in the Philadelphia Commercial Museum specimens of Siam and Chinese cardamoms similar to those described by Hanbury. It is well to note that what was rare in 1855 may be as common as possible now, although not to be found in American or British commerce.

Calcutta Tea Sales. The first of the new season's tea auction, was held on Friday, the 12th instant when about 10,000 packages were offered for sale, of which 8,000 were sold. There was a good demand for teas with stand-out quality from all districts and for all pekoe souchong and medium sorts, especially pekoes and broken pekoes with point. All teas with desirable cup were well competed for, and a large portion of these were withdrawn. The prices compared favourably with last year's opening prices.

Testing Seeds. The testing of seeds has been reduced to a science in Europe, especially in Scandinavia and Denmark. When the Danish seed control station was first established in 1870-71, the average purity of grass seeds was 64 and their germination only 45, whereas now the figures have been raised to an average of 94 purity and 89 germination. In other words, the purity of the seeds and their germinating quality is now about twice as good as it was 25 years ago. One man and an assistant is all the help needed to run a seed control station.

America's Imports of Tea. The imports of tea into the United States for the first eight months of the present fiscal year, ending February, were as follows:—

From—	1898. Pounds.	1899. Pounds.
China	32,145,071	26,647,600
Japan	19,731,223	27,469,665
United Kingdom	1,491,014	943,533
East Indies	1,469,126	1,069,657
British North America	439,125	596,152
Other Asia and Oceanica ...	257,778	1,187,253
Other countries	1,911	9,392
Total...	55,535,248	57,923,252

A Present of Coffee to the Queen. Some little time ago the missionaries of the Zambesi Industrial Mission, in British Central Africa, sent to the Queen a box containing about 20 lbs. of coffee as a sample of the crop (of some forty tons) which had been raised on the plantations of the Mission, by means of native labour, under the supervision of the missionaries. The sample represented the coffee in four of its different stages of preparation. (1) In the berry, as exported, after being gathered, pulped, and dried; (2) the berries cleaned and stripped of their husks as sold in the London market; (3) the berries roasted; (4) the coffee roasted and ground ready for use.

The Decline in Cinchona. The *British and Colonial Mail* has the following remarks on the decline in the value of the unit:—The depressed feeling in the speculative quinine market had affected some of the holders of bark, and they were prepared to take lower prices at the cinchona auctions on Tuesday. Add to this a fact that had much more influence, *viz.*, that the greater proportion of the bark sold was poor stuff, parted with at a very low price. Then the regular buyers for the most part determinedly refrained from making bids. These were the circumstances of a decline in the unit, the latter coming out at 1⅝d. against 2½d. at the last London auctions, a decline of 35 per cent. . . . . the quinine manufacturers, although buying eagerly at a 2½d unit a month ago, would scarcely have anything this week when they could buy much cheaper. Out of 800,000 lbs. offered, nearly 200,000 lbs. sold.

Artificial Fertilizers. The *American Agriculturist* remarks:—Better fertilizers at less cost than in former years are now the rule, at least among high-grade goods. While the consumption of fertilizers has probably doubled within the last ten years, yet the discovery of raw products and the utilization of by-products have more than kept pace with the consumption and have caused lower prices. The discovery of Florida, Tennessee and Algerian phosphates has kept down the price of phosphoric acid. The opening of new nitrate deposits in Chili and the formation of new companies there, together with the utilization of animal products in this country, has reduced the price of nitrogen; also the utilization of ammonia from coke plants and from iron works. Potash is mixed at less expense and sold on closer margins than

formerly. All these causes have resulted to the advantage of the buyer of plant food.

Helopeltis. *Physiologist* writes to the *Ceylon Observer*:—My experience is that this insect confines its ravages chiefly to the low-country. I have always found it worst in the dry season, most noticeable in fields seven to eight months from pruning. I do not believe that it decreases as the shoots get smaller, or harder either. In the young fields this insect may be found as well, not on the tea, but on the leaves of the cinchona and guava trees, which is much in evidence up here. I have repeatedly seen the children go up and pick off from one to half-a-dozen off the trees mentioned, the tender leaves of which also bear signs of the ravages caused by this insect. I have tried catching them, and have had brought in for months and months about half a tobacco-tin of the insect, but it shewed no signs of extermination, so I have left off wasting money on such uncertainties until a more efficient method has been devised whereby to rid the tea of this troublesome pest.

Copper Sulphate and the Treatment of Vines. It is only since 1897 that sulphate of copper has been imported into Patras (Greece) to any extent, but as it is apparently the only remedy known as yet against the "*peronosporos*," importation is likely to increase annually until sufficient is brought into the country to treat all the currant and grape vineyards of Greece with the solution known as the "bouillie Bordelaise." Last season many proprietors, for the sake of economy, and others who did not believe in the efficacy of the remedy, neglected to treat their vineyards with a solution of sulphate of copper, the consequence in many districts being the partial or total loss of the crop. In 1897 about 2,500 tons of sulphate of copper were imported into the Patras district, principally from Great Britain. This was sold retail at £20 per ton. The importation last year was about 3,000 tons which fetched on an average £22 per ton. This year, owing to the rise in the price of copper, price has gone up to £28 per ton, duty-paid, or the equivalent of £23 15*s.* f.o.b. London or Liverpool.

Rubber from year-old Trees. The *Queensland Agricultural Journal* remarks that the most interesting point under discussion in relation to rubber planting in the British West Indies is a series of experiments now being carried on in London and Trinidad, by which it is proposed to secure rubber from year-old trees of the *Castilloa elastica*. It has been found that seed sown broadcast over a prepared field will yield an abundant crop of young trees, which at about a year old can be cut and sent to a factory where, with ordinary machinery operating a simple process, eight per cent of fine rubber can be extracted from the young shoots. This can be done in the laboratory. It is claimed that the process is a simple one, that but little machinery is necessary, and that in future the world's rubber supply will be secured from an annual crop of young trees sown on cultivated estates, and not from remote forests as at present. A series of experiments has shown that the young tree contains about eight per cent. of rubber, which would at present prices return an estimated profit of 200 dollars to 400 dollars per acre. The extraction of rubber from young shoots has been accomplished chemically in the laboratory, but whether it can be applied to the economic production of rubber on a large scale remains to be seen.

The Two Sides. Recent remarks of Professor W. H. Jordan, Director of the New York Experiment Station, deserve to be studied by Indian planters. Paraphrasing them to apply to coffee and tea planting rather than to dairy-farming, we give the gist as follows:—The marked change which had taken place in agricultural methods in recent years could much of it be traced to the work of these stations, but agriculturists ought not to expect too much. The stations are yet in their infancy, as regards practical usefulness. In former years there was a vigorous expression of individual opinion in regard to agricultural methods. The stations had done away with much of this, they being replaced by more scientific methods. There were two divisions to agriculture, the agricultural and the commercial. The experiment stations dealt with the former more than the latter. The commercial side should not be allowed to predominate. What was really wanted was more planters who were stronger on the agricultural side and weaker on the commercial side. The fundamental principles necessary to success are on the agricultural side. When perfected the commercial side will care for itself. The experiment station has furnished the necessary standards employed in agriculture and its kindred subjects. In this way have these stations been a great and important factor in progress, for without these standards there is still chaos.

Cinchona in Java. The *Chemist and Druggist* has the following:—The unknown quantity to quinine speculators is the condition of the cinchona-industry in Java, and whether it pays the planters or not to produce. "Why shouldn't it pay?" asked a sapient person in the Commercial Sale-rooms the other day. "Oak bark sells at 5*l.* a ton, and pays." "Because it is a by-product," added a long-headed broker. "They cut down the oak-trees for the sake of the wood." In Java they grow cinchona for the sake of the bark. We have before us a report regarding the plantations there, which gives the latest available information, and from this we learn that the Government has decided on principle to give up the cultivation of cinchona, and transform the plantations into experimental gardens. This will be done gradually, no seedlings being planted in place of the uprooted trees. The Government plantations are eight in number, and to three of these plantations nurseries are attached for the propagation of seedlings and grafting. The number of trees in the plantations diminished in 1897 by 11 per cent., and, as the reduction will go on at about this rate yearly, it will be eight years at least before the Government ceases to be a competing factor. There are eighty-three private plantations in Java, of which fifty-eight are situated in the Praenger province. These show no indication of reduction. The Bandoeng quinine-factory is now able to produce quinine to the extent of 3,500 ozs. per day, or 2,500,000 ozs. a year and the Pandang Aroem works are gradually pulling up. So that there is no intention of stopping Java quinine. Thirty-four cases of the Bandoeng brand were landed at Amsterdam this week.

GENERAL ARTICLES.

THE INDIAN TEA TRADE.

In our London report of Indian tea this week, says the *Grocer*, we give particulars of the actual outturn of the crops for the present season (now drawing to a close) for 1898-99, as published under the authority of the Indian Tea Association, by which it will be seen that the total production was nearly 153,000,000 lbs., or the largest ever known. The increase over the entire crops in 1897-98 and 1896-97 was, in round numbers, between 4,648,000 lbs. and 4,683,000 lbs., whilst as compared with 135,479,000 lbs. in 1895-96, and 127,127,000 lbs. in 1894-95, the aggregate quantity of Indian tea raised this season was many millions of lbs. heavier than in those years. From the very outset, when the crop was originally estimated at fully 158,000,000 lbs., the yield of tea in British India for 1898-99 has been regarded as of unexampled extent, and at one time a lower range of prices than ever was expected to rule in consequence. In this hope, however, the trade have been greatly disappointed, for besides increasing demands for consumption at home, there have been developments and wider outlets for shippers in other quarters, which have been large enough to absorb the whole of the surplus supply above shown; and since the end of December last the market has, without interruption, maintained a strong rising tendency.

That Indian tea has a powerful hold upon consumers, not only here but in other countries, may be inferred from the expansiveness of the deliveries, which progress at a faster rate than hitherto. In London alone, during the past twelve months—*i.e.*, from April, 1898 to March, 1899, inclusive—they amounted to 142,712,200 lbs., as contrasted with 127,418,450 lbs. in 1897-98, and 124,587,600 lbs. in 1896-97. These totals, it should be explained, combined the clearances for home use as well as for exportation, as in the private returns of the movements of the article the quantities retained for domestic consumption and those shipped away to foreign parts are not kept separate. For details of these distinct branches of the tea trade we refer our readers to the summary of the Board of Trade returns on another page, giving the official figures for the first quarter of 1899 and the two previous years. The comparisons thus afforded convey a good idea of the favour that Indian tea is growing into everywhere, and also furnish a convincing proof of the rapid strides that it is taking in beating all former records of its consumption and distribution. As in most trades of a legitimate character, the general and persistent demand for Indian tea has proved to be the backbone of the whole business; and as portions of supplies, which formerly came almost exclusively to the United Kingdom, have been diverted to other markets, who have threatened to outbid the native British for a larger share of the available crops yielded in Assam, Cachar, Sylhet, Darjeeling, and other well-known districts, the landings in London, as the chief port of entry in this country, have been much lighter than might otherwise have been calculated upon, and the stock has recently diminished to 52,399,850 lbs., compared with 59,051,400 lbs. in April last.

It has, therefore, been on reasonable and justifiable grounds that prices have taken a sharp upward turn since the beginning of the year, and, judging from the existing state of the market, there is nothing in its position and prospects to encourage the belief that an early return to cheaper rates, such as prevailed in the closing months of 1898, is in the least probable. The lowest points for Indian tea ever known were, no doubt, during the latter half of the year just named, when Pekoe Souchongs were knocked down in public auction at 5d., and leafy Pekoes at 5½d. per lb., with other common kinds in proportion; but the full rise since then has been 2½d. to 3d. per lb.; and this difference in the wholesale or import price must have seriously affected, even if it has not entirely covered, the margin for profits usually allowed on tea in its passage from the shipper or consigner to the hands of the consumers or retailers. The future of tea may thus not unreasonably be described as *couleur de rose* from a producer's point of view—a fact which must be highly gratifying to those who, year after year, were struggling hard to open fresh fields for extending the use of British-grown tea; and the more remunerative prices now current cannot fail to stimulate the Indian planters to still greater exertions.

CINCHONA: A RETROSPECT AND A PROSPECT.

There is no need to tell regular readers, says *The British and Colonial Druggist*, that cinchona bark and quinine are now at one of the most interesting periods of their history since the introduction of the former to Europe in 1640 and the discovery of the latter about 1820. For the benefit of those, however, who have missed the opportunity of following recent developments in these drugs a few succinct notes on these will be worth giving, and we may at the same time add something new in the shape of information as to the course of events in the future

* * *

The situation of the moment is this. Quinine has seen a period of active speculation, during which its price in the "second-hand" market (that is in the buying and selling of German quinine in London that mainly takes place in Mincing Lane and between parties none of which are makers) has gone up to 1s 9¼d. per ounce, and since receded to 1s. 4d. This advance was anticipated in the *B. & C. D.* of January 27th, at which time quinine was exciting no attention, and was only worth 10½d. per ounce. The natural cause of such an advance, was, according to our articles of that and subsequent dates, the short supplies of bark that continental makers of quinine possessed, in spite of the huge shipments from the producing countries in 1898.

* * *

The course of events that has led up to this state of affairs is remarkable. South America, the home of the cinchonas, has for some years been almost a negligible source of supply for cinchona bark. Since the cultivation of the cinchona trees was taken up in Java, India, and Ceylon, prices have declined so much as to discourage the exporters and collectors in South America from pursuing their labours. India and Ceylon, once started on the cultivation, rapidly grew, the latter especially extending its output so quickly as to cause most venturesome prophecies of its future. But prices became too low even for it, and Java, which was longer in getting on its feet, when it did stand took a firmer footing, and so has been able to endure the cutting down of prices. The Dutch in this island laid hold of the best kind of tree, and then made tremendous strides in securing the bark market, which was thus transferred from London to Amsterdam. Ceylon planters at last found prices so unremunerative that they began uprooting trees, and turning their attention to other things. India reached her height in 1889, and has since then been going down fast, her planters also being disgusted with the reward of their outlay. And all this time Java has not only managed to hold on but to grow.

* * *

While all this has been going on the consumption of quinine has been enlarging. The reduction of the price of bark was to a large extent the result of a combination of the quinine manufacturers. At length the worm turned; the bark importers in Amsterdam made a stand, and supported by the strength of the market that had now been attained (through the fact that Java exports had not grown enough to make up for the loss from India and Ceylon and the increased consumption) they secured a slight advance in the price of bark. This encouraged India and Ceylon to ferret out all their stores, and ship as much as they could. Hence it came about that in 1898 there was more quinine in bark form shipped from the growing countries than ever there has been before. Yet, to-day, stocks of bark in the public warehouses of Amsterdam and London are lower than they have been for years. So that the observant ask, what is to become of the price of quinine? Where is the bark to come from? And that is a subject for another paragraph.

* * *

If it be true that India and Ceylon last year put forth as big an effort as they are capable of, then we cannot look to them for increased supplies unless they begin again to extend plantations, and the crop from these would not be ready for five years at least. Java appears (though the statement here is more doubtful) to be in the same condition. It looks then as if we must turn our attention to the original source of bark once more And here we are dealing with a mysterious factor. No one can speak except hazily about the supplies America holds. Judging by the history of past years, it would seem that we must depend on Columbia for most of the natural South American bark. And it will not pay Columbia to start collecting again until bark is much dearer than it is at present. A planter we have seen, who has a very lengthy acquaintance with

the chief producing districts, considers that a unit of 4d. would have to be reached before it would pay to collect even the riche barks. This means that, whereas now the unit is 2½d, *i.e.*, that $\frac{1}{100}$ lb. of quinine costs whilst in the bark 2½d., the same amount would have to be worth 4d. If this were so, quinine (in bark, would be worth, to manufacturers, 2s. 1d. per ounce, and worth, to the wholesale dealers, about 2s. 6d. per ounce. If Java, India, Ceylon and Africa cannot produce enough to meet the demand until five or six years have elapsed and the expert's view given above is correct, then there is nothing for it but to pay the price we have named.

* * *

And that is a prospect worth studying, Perhaps it will tempt some of our readers to sigh for the planter's existence. But they have had their bad times—these planters—and it is to be hoped their opportunity is coming at last.

* * *

The next question is, will they make use of their chance? They can scarcely help doing so if they do not behave with the utmost folly. In that unlikely possibility, however, that we had in mind when we spoke just now of Java's apparent condition—the possibility, that is, that it has not been sending over as much bark as it can by normal collection, there may arise a forced collection under the impression that present prices are worth this; and if the quinine makers, aided by this, do manage to press the price down a little the importers may give way further. But this would be extraordinary folly on the part of the bark growers and importers, and not in accordance with their recent conduct. If they show only the smallest amount of firmness they can let makers see that the recent manœuvre which the latter made is transparent and refuse to be drawn into working the game of the latter.

CHINA TEA.

The following figures show approximate exports from China and Japan in 1898-99 as compared with 1897-98:—

FROM CHINA

To United Kingdom and Continent.

	1898-99. lbs.	1897-98. lbs.
Hankow and Shanghai	12,230,663	15,099,727
Foochow	12,976,578	12,606,188
Amoy	688,318	686,651
Canton	5,149,722	5,889,288
	31,045,281	34,281,854

To United States and Canada.

	1898-99. lbs.	1897-98. lbs.
Shanghai	16,621,547	20,836,003
Amoy	15,036,413	15,861,506
Foochow	9,178,280	7,740,345
	40,836,240	44,437,851

To Odessa.

	1898-99. lbs.	1897-98. lbs.
Shanghai and Hankow	22,783,272	19,462,293

FROM JAPAN

To United States and Canada.

	1898-99. lbs.	1897-98. lbs.
Yokohama	25,944,170	26,826,182
Kobe	13,948,634	16,732,118
	39,890,804	43,558,300

It will be observed, says a Colombo paper, that there is a comparative decrease all round, save in the case of shipments from China for Odessa, which are 3,300,000 lbs. in excess of those in 1897-98.

RAINFALL AND FERTILITY.

Mr. John Hughes, F.I.C., writes from London to the *Ceylon Observer*:—

Sir,—That fertility is largely associated with the rainfall is fully recognised: but that excessive rainfall causes a loss of fertility is perhaps not so fully recognised.

At Rothamsted for upwards of 20 years a most complete system of collecting and recording the rainfall, as well as the drainage water passing through 20 inches of arable land, has been established, and the results afford valuable practical information.

The amount of nitrogen found in this drainage water has been carefully determined and calculated into the equivalent of nitrate of soda and the results have been tabulated as follows:—

AVERAGE RESULTS OF THE RAINFALL AND DRAINAGE AT ROTHAMSTED FOR 20 YEARS, 1877-78 to 1896-97.

	Rainfall 1-1000th Acre Gauge.	Drainage.	Retained in Soil or Evaporated.	Nitrogen lost per Acre reckoned as Nitrate of Soda.
	Inches.	Inches.	Inches.	lb.
September	2·63	1·04	1·59	25·0
October	3·38	2·07	1·31	40·7
November	3·14	2·41	0·73	40·3
December	2·42	·95	0·47	23·5
January	2·04	1·67	0·37	16·4
February	1·95	1·55	0·40	15·7
March	1·88	1·00	0·88	9·4
April	4·89	·52	1·37	6·3
May	2·17	·58	1·59	7·2
June	2·33	·61	1·72	7·9
July	2·80	·73	2·07	13·3
August	2·94	·87	2·07	18·4
Harvest year	29·57	15·00	14·57	224·1

It will be noticed that the losses of nitrogen during the winter months from September to February, average 161·6 lbs. nitrate of soda, or 72·1 per cent. of the entire average losses of the year.

From these figures it will be understood that after continuous rainfall the soil becomes *temporarily* impoverished, and consequently in need of readily available plant-food.

These remarks will have special application to a climate like that of Ceylon, where there is a heavy annual rainfall, and to plantations like those of tea, coffee, and cacao, which are kept constantly under cultivation and free from weeds.

TEA IN AMERICA AND EUROPE.

Mr. Ayden, who recently returned to Colombo, after spending six months' travelling in the interests of Ceylon tea, stated to a representative of the *Times of Ceylon* a few days ago that Ceylon teas were certainly gaining ground in the United States as against Japan and China teas. He agreed that the "Thirty Committee" were doing well in advertising as was done at present, and could not suggest any better method, and he was not in favour of subsidizing certain firms to push the article as was recommended in certain quarters.

"Are you in favour of introducing green teas into the country as advocated by Mr. Mackenzie?" asked the reporter. "Yes, I think there is a fine opening for Ceylon green teas. Of course they will have to compete with China and Japan greens, but I think that is only a matter of time, especially if the planter makes the tea"

THE AMERICANS WANT.

A certain amount of black tea would always be used, but it was only a small percentage of the total consumption, the principal teas being the greens and oolongs.

They had been greatly handicapped by the duty imposed at the time of the war of 10 cents. (5d) per lb., while coffee went free.

It made tea so much more expensive than coffee, which had a tendency to become cheaper. That the latter was the national beverage was seen in the fact that coffee was consumed last year at the rate of 11 lbs. per head of the population as against under 1 lb. of tea. Tea was drunk very much more in Canada than in the States, even amongst the French-speaking people, who, however, live in the same way and have much the same habits as their English-speaking neighbours. He thought in America the trade were favourably inclined towards Ceylon tea, though they used it in blending with China and Japan teas. Our tea can be obtained by itself in the principal cities, but it was difficult to get pure Ceylon tea in the smaller towns, though they had some very excellent blends. Apart from the pushing of tea Mr. Ayden had time to look round and was struck with the go-a-headness of the people. Even this was to the advantage of Ceylon, for if once they could be got to take up our teas they would go for it for all it was worth as they do with every other things they go in for.

Mr. Ayden's next journey was from London through Holland, Germany, Austria and Central Russia as far as St. Petersburg. Asked which country was the greatest tea-consuming one, he replied without hesitation Russia, adding that there was a great future for our teas there. Ceylon tea was used there to blend with China teas in order to increase the strength. With regard to the tea-duty in that country he did not think there was much chance of getting it reduced. It was very heavy, being about 1/8 per lb. and he mentioned that he had to pay three roubles for a lb. of pure Ceylon tea or 6/ in English money.

With respect to the other countries visited, tea was not a big article and was not much consumed, though here again Ceylon tea was becoming more liked than China and Japan and the prospects were favourable. The trader had no difficulty in selling tea, as it is shipped, direct to Hamburg, Bremen, and other Continental Ports.

PLANTING IN B. C. AFRICA.

COFFEE IN MLANGI.

An ex-Ceylon Planter writes to the *Ceylon Observer*:—In the middle of our cold season the thermometer during the night goes as low as 48 and 50 deg. and during the day seldom above 65 deg. The cold commences with the middle of our crop season, July; but unfortunately the drought during the blossoming months left us little to trouble about. So no one was very busy, for the study is to keep down expenditure.

COFFEE

here is not the success I anticipated. This country is subject to periodical droughts during the blossoming months, September, October and November, accompanied with hot winds from the plains between the sea and here, which do a tremendous amount of damage to coffee; besides burning up the blossoms and set crop. It scorches the trees to such a degree that it takes about two years for them to recover: not only is the wood killed, but the very trees especially young ones (one or two years old) are so much damaged that they never recover, being burned right into the ground. The result of those scorchings is that canker sets in, the trees are bark bound, the sap-cells become diseased and black and empty beans become in course of years so numerous that the only visible remedy is the cutting down to the ground. This no doubt accounts for the stumping of old coffee, which has been done in this country by planters from time to time. After stumping a good sound crop is obtained again, the same as the maiden crops usually are

The necessity for

SHADE

is now recognised and most planters in the country are going in for it by either planting local trees or imported ones. I must say I prefer the latter, at least those that have been proved good coffee shade trees such as the dadap, albizzia moluccana, &c.; but the difficulty is in getting seed imported as it is only procurable from the East where leaf-disease is so prevalent. We have some excellent shade trees in the country, but they don't grow so fast as the dadap and others familiar to me in Ceylon.

I never saw coffee on the Uva-side or anywhere else in Ceylon

BLOSSOM

the same as it does here: 10 to 15 spike in a cluster is the usual number. So you need not wonder at 8 cwt. an acre being secured from the primaries as a maiden crop, which is quite common, if a favourable season is got; but older coffee gets weakened by repeated droughts, and supposing it gets favourable weather during the blossoming season, the berries drop off even when the size of peas, the same as they used to do in Ceylon through the effects of leaf-disease. This does not occur, however, where there is any shade, even that of an individual tree or two suffices to save the crop. Our climate is, I suppose, as suitable as any in the world (and our soil in most districts is exceptionally good) for the successful cultivation of coffee, were it not for those occasional dry seasons, so disastrous to the health and vigour of the coffee tree.

I am strongly of opinion that the best and most successful way to treat coffee here and ensure the best results is to allow it to run up into

NATIVE COFFEE

or at least till it reaches six feet the same as is done in Java, so that the crop would be matured higher off the ground and the cover effected by the lofty trees would keep the ground cool. At present cultivating, as we do, our trees, well handled and pruned leaving little wood, are forced too much, beyond their strength, blossoming to the tune of a ton per acre, which they are unable to stand, when the thermometer registers 96 deg. and 98 deg in the shade and the ground does not, during the night, lose the heat of the day before, being quite warm in the morning. No dew falls as a rule during this time (October and November our best blossoming months). Owing to the country bush-grass burning night and day at this time of the year, the air is fearfully dry. The objection might be raised to allowing coffee to run up to 10 or 15 feet, viz., wind (the trees' greatest enemy). I know most districts in Ceylon, some where I've seen the coffee pulled up by the roots by wind and others where you had to get off your horse and hold on to the grass by your teeth, and others where bullock bandies were blown off the road, with 1½ ton loads in them; and yet coffee with staking when young stood it all and paid well. We have no such wind here, coffee is never staked, and does not need it, in any of the districts I have seen. I am quite convinced that low topping, *especially in green wood*, does a fair amount of harm to our coffee and this is usually done to try and secure a big maiden crop.

I myself tried it and nearly killed some beautiful young coffee: in fact it has never recovered the shock it got, with a dry season to boot.

We are now in

TELEGRAPHIC COMMUNICATION

with the old country and it is expected that we shall have a railway from the coast before long. The Portuguese Government is to build a line from Quilimane to Chirmo: the line has been surveyed and the funds voted for the construction of this line which is very necessary to connect with our mountain line into the Shire Highlands as the river from Chinde (our coast port) to Chiromo and Katungas is a very unsatisfactory means of transport, as the water is very low for half of the year, rendering it almost unnavigable for the smallest draft steamers constructed. It is just as bad as your Kelani and Kaluganga are in the dry season.

Our projected

RAILWAY

from Chiromo into the Highlands and from thence to lake Nyassa has been twice surveyed over by Mr. McCrombe on account of the African Lakes Company and a party of Engineers are now at work between Blantyre and the lake on account of Government. So this line which is an absolute necessity for the future development of the country is bound to be constructed soon, and (when as it is well-known) Mr. Rhodes and his Beira-Mashonaland Railway company are interested in the line to tap the B. S. A. Company territory North of the Zambezi, and beyond this protectorate, is a sure guarantee of a railway being built from Chiromo through the planting districts, which show no engineering difficulties, at no very distant date.

Our present means of transport are very unsatisfactory and traffic gets congested every dry season and thousands of labourers are employed for transport when they might be utilized for agricultural purposes.

Missionaries and trading Companies are determined to have the railway carried right to their very door in Blantyre, irrespective of the future requirements or the development of other parts of the country.

TEA

is a success here: it grows fast and flushes well all the year round, with the exception of about two months, and the quality, flavour and strength compare fairly well with Ceylon's medium elevation tea. Not to trust to my own opinion, I sent a flush to an experienced Ceylon planter to make and taste and he pronounced it as excellent tea and a good marketable article. I have planted up a few acres and intend to extend, although there is a fear of over-production and lower prices. Our cheap labour (2d per diem) will enable us to compete with Ceylon and India, if not China.

The tea introduced into the country by the Blantyre Mission (which most old planters have got a few bushes of) is not of a superior jât; but I have seen many worse in Ceylon, and it seems to suit our climate well, which is the great thing.

This country seems to be the home of the

TOBACCO

plant and should become a great competitor of Cuba, Manila, and other countries if acreage and soil is to be considered.

P.S.—Dunraven, Mlangi, 15th March, 1899. We have had a very good year, and a decent crop is maturing on the trees nearly everywhere and people and prospects are looking much brighter than they were when I wrote the above letter.

JAPAN TEA IN CANADA.

The Japan tea market during the past year has been an interesting one on account of its peculiarities.

It was a year ago, all but two weeks, since it opened. The actual date of the opening was April 28. Until May 8, a steady business was done, although at gradually declining prices. On that date, however, heavy buying commenced, with the result that all grades below "finest" advanced.

A month later, cable advices to the effect that the United States intended putting a duty of 10c. per lb. on tea caused a falling-off in business and a depreciation in values. And when it was known that the duty was an accomplished fact, the prices suddenly dropped 4 to 5 yen per picul. A yen, it may be noted, is equal to 49 8-10c. in gold, and a picul is equal to 133·3 lbs. With the drop in prices, however, came a good demand, especially for the low grades, but this continued only for a few days, as buyers were eager to secure the early second crop leaf, and prices advanced to what they were before the duty excitement developed. For some days the prices paid were higher than those paid for first leaf.

The end of July saw the market again taking a "bearish" turn, and it continued to decline until the third crop began to arrive, and this being particularly good quality, both in leaf and liquor, prices again appreciated. In October, the market became slightly easier, sellers being more willing to meet the views of buyers, but, since then, the market there has ruled steady, and, it is worthy of note, most of the purchases since then have been on Canadian account. The total amount of settlements in Japan up to March 24 last was 214,000 piculs, against 218,000 the same time last year.

Up to December 15 last, according to a statement published in the *Canadian Grocer* some weeks ago, the quantity of tea shipped from Japan to Canada was 11,283,948 lbs. against 8,334,693 lbs. to the same date in 1897.

In spite of the ups and downs of the market the range of values in Japan the past season has been considerably higher than it was the previous season. The quality of the leaf and crop has also been better, particularly the third crop, which is said to be the finest ever known in Japan.—*Canadian Grocer.*

INDIAN TEA ASSOCIATION.

The following are extracts from an abstract of proceedings of a meeting of the General Committee held at Calcutta on the 1st instant:—

Proceedings of the Assam Branch of the Association for March were laid on the table. These proceedings included, among other matters, a memorandum by Mr. J. Buckingham, C.I.E., the Chairman of the Assam Branch, with reference to a resolution passed by the General Committee at their meeting on 6th February in which the opinion was expressed that it would be injudicious to discontinue the American Market Fund at present. Mr. Buckingham stated in his memo. that he was of opinion that the Assam Branch should strengthen the hands of the General Committee by protesting in the strongest terms against the discontinuance of the work in America. From a letter, dated 20th April, which had been subsequently received from Mr. Buckingham, the General Committee learned that the Committee of the Assam Branch concurred in the opinions expressed in the memorandum

It was decided to inform Mr. Buckingham, in reply to his letter, that it was not open to the General Committee to take any further action in the matter, as it had been decided at a meeting of the London Committee, held on 31st January, without reference to India, that operations in America should be discontinued. In his letter of 3rd February Mr. Tye, the Secretary of the Association in London, had stated that the Committee were unanimously of opinion that the time had arrived for discontinuing the work, and had accordingly instructed Mr. Blechynden to bring his Mission to a termination Mr. Tye further stated that Mr. Mackenzie, the representative of Ceylon in the United States, had also informed his Committee that the work in America could well be brought to a speedy termination.

Letters of 24th and 31st March, and 7th April, from Mr. Ernest Tye, Secretary, Indian Tea Association, London, having been previously circulated, came up for final consideration and disposal. In these letters Mr. Tye stated that the London Committee had made an arrangement with Mr. E. F. Langdale to carry out the sale of Indian tea at the Paris Exhibition on the understanding that the Association should not be responsible for any outlay beyond the sum of £1,000 agreed to be paid to the Royal Commissioners for the space which had been allotted for the representation of Indian tea. Mr. Langdale was well known in connection with work of a similar description, as he had been associated with the Health Exhibition held in London in 1884 in a like capacity. It was understood that in the arrangements to be made Mr. Langdale would follow the lines observed by him at the latter Exhibition which gave general satisfaction. Mr. Langdale would arrange for the service of Indian tea in the cup, and would make special efforts to render the Court in which it would be served attractive to visitors. The London Committee had also had under consideration the question of the lines upon which a new Levy should be conducted for opening out new markets other than the American for the sale of Indian tea, and had received favourable replies from a few concerns in London to the circular issued by them on the 24th February, in which subscriptions were invited.

The General Committee noticed, however, that the London Committee had not specifically stated upon what lines the new levy was to be raised. The answer which had been received to their telegram of 11th April, which it was decided at the last meeting of the Committee should be sent, did not make the intentions of the London Committee clearer, and it was therefore agreed to despatch immediately a further telegram asking for details of the new scheme for opening out foreign markets. The General Committee were strongly of opinion that no satisfactory appeal for funds could be made without some knowledge of the programme proposed and that speedy action was essential to success. A remark to this effect was to be included in the telegram to be sent to the Committee of the Association in London.

Letter of 7th April from Mr. Ernest Tye, Secretary, Indian Tea Association, London, dealing with the American Market Fund, came up for final consideration and disposal after previous circulation. In this letter Mr. Tye stated that from an interview he had had with Mr. Mackenzie, the representative of the Ceylon Association in the United States, he understood that Mr. Mackenzie had recommended the Ceylon Committee of Thirty to continue the work in America for two or three months only in 1900. The decision of the Ceylon Committee had not, however, been so far received. The General Committee also understood that the balance remaining of the amount raised by the last Levy, after the close of Mr. Blechynden's Mission, would be devoted to the continuance of the advertisements issued jointly by the representatives of Indian and Ceylon teas.

The General Committee were of opinion that no action could be taken by them with reference to these matters, which came strictly within the province of the Committee of the Association in London, and ordered the letter to be recorded.

Considered letter of 7th April from Messrs. Gow, Wilson & Stanton of Rood Lane, London, enclosing copy of the statistics of imports, deliveries, and stock, of Indian and Ceylon tea in London

during the month of March. From these figures it appeared that the deliveries of Indian tea during March 1899 were nearly 1½ million pounds above those of March 1898. This brought up the increase in deliveries of Indian tea for the first ten months of the season to 13¼ millions ahead of the corresponding period last season, while the stock was 6½ millions below that at the end of March 1898. Messrs. Gow, Wilson & Stanton were of opinion that smaller Ceylon deliveries were accounted for by the higher relative prices at which the lower grades of Ceylon tea were selling during a large portion of the season. It was satisfactory to notice that the stock was practically the same as a year ago.

The letter was ordered to be recorded.

Considered memo., dated 24th April by the Vice-Chairman asking the views of members of the Committee as to whether it would be advisable to address, from a tea point of view, the representatives of the Bengal Chamber of Commerce on the Special Committee which had been appointed by Government to examine into the merits of the scheme for a Central Railway in Calcutta, a Central Passenger Station and a permanent bridge over the Hooghly. The Vice-Chairman pointed out in the course of this memo. that it was proposed to levy a toll of 1½ pies a maund on goods, to pay interest on the cost of the works in connexion with these projects if they are not self-supporting. It appeared to him that tea was more particularly concerned in the matter of the proposed tax than most other trades, because it was quite certain that tea would not use the new line. He understood the promoters of the scheme to say that the Railways would themselves pay this tax. It was to his mind quite obvious that, if the Railways had to pay the proposed tax on the goods they brought into Calcutta, sooner or later in some form or other, such goods would have to bear the burden. He wished to have opinion of the Committee as to whether tea grown in Assam or elsewhere should be taxed to improve Calcutta, and to give profit to a private Company. The Vice-Chairman added that his object in circulating the memo. was not to oppose the scheme, which he personally would like to see carried through, but merely to put forward the case from the tea point of view against the payment of the proposed tax.

After some discussion the Committee agreed to suggest these points to Mr. E. Cable, and Mr. J. Gemmell, the representatives of the Chamber of Commerce on the Special Committee appointed by Government, and to ask them to see that they are considered. The Secretary was directed accordingly.

Considered letter No. 1826-Agri. of 27th April, from the Secretary to the Government of Bengal in the Revenue Department in reply to the Committee's representation No. 162 of 15th idem to that Government with reference to the question of the appointment of a scientific officer for the tea districts. In their letter the General Committee asked whether any assistance could be afforded from Government funds for the purpose of securing the services of such an officer. In the reply quoted it was intimated that His Honor the Lieutenant-Governor was pleased to sanction a grant of Rs. 5,000 a year, for a period of three years, for the purpose, by which time it was hoped that the expenses of the Committee for the opening of new markets would have diminished sufficiently to permit of the withdrawal of the grant.

The General Committee received this announcement with much satisfaction, and directed that an expression of their most cordial thanks be conveyed to His Honor the Lieutenant-Governor through the Secretary to the Government of Bengal in the Revenue Department, for the grant he had been pleased to sanction.

At the last meeting of the Committee a letter of 14th March, from the Secretary to the Chief Commissioner of Assam, on the same subject, was considered. In this letter Mr. Cotton stated in reply to the Committee's representation of 21st February, that he was unable to hold out any prospect of being able to contribute from provincial revenues towards the expenditure which would be involved in securing the services of a competent scientist to undertake the work.

The General Committee now decided, in view of the grant promised by His Honor the Lieutenant-Governor, again to approach the Chief Commissioner of Assam, informing him of the action taken by Sir John Woodburn, and asking whether it would be possible for a similar amount to be contributed by the Assam administration. If this additional assistance were forthcoming the General Committee thought that a further sum of Rs.5,000 a year, for three years, might be contributed from the General Funds of the Association. A total of Rs.15,000 per annum would then have been raised which, in addition to a contribution of Rs. 200 monthly, promised by the Assam Branch of the Association, would bring the monthly income attached to the new post up to over Rs.1,400. It was considered that by the expenditure of this sum the services of a competent scientific officer could be obtained without difficulty and all other charges be met.

The General Committee considered that the matter was one which should be laid before all the members of the Association at the Annual General Meeting, especially in view of the fact that it would probably be necessary to recommend to members that a portion of the surplus funds of the Association should be devoted to the purpose. It was accordingly decided to issue immediately a circular to all members informing them that assistance had been promised by Government to the proposed expenditure for the engagement of a scientific officer, but that the Committee were not in a position to state definitely the form the scheme would eventually take. They had, however, reason to believe that they would receive sufficient assistance from Government to enable them to defray the balance required from the surplus funds of the Association if members generally were agreeable to this course being adopted. They therefore proposed to draw the attention of members to the question at the Annul General Meeting, and to take the sense of the meeting upon the proposal.

The Annual General Meeting was fixed for 3 P. M., on Friday the 26th May 1899.

TEA, &c., COMPANIES.

The Degolla Estates Company.—At an extraordinary general meeting of the Degolla Estates Company, held at Kandy, on the 8th instant it was unanimously agreed to reduce the Company's capital from R220,000 to R130,000, and another meeting will be held on the 12th proximo to confirm this resolution.

Alliance Tea Company of Ceylon.—Nett profit £5,207-11-2. Interim dividend of 3% is now supplemented by a final dividend of 4%, making 7% for the year.

The following table gives the acreage and results for the year:—

Estate.	Acreage in bearing. Full.	Partial.	Tea crop. lbs.	Cost per lb. in cents (including manuring).	Nett price realized per lb. in pence.	Working profit.
Aberdeen	387	—	128,740	32·39	5·13	—
Calsay	342	—	153,505	29·00	7·54	£1,688
Dunkeld	322	50	144,926	31·32	6·59	812
Luccombe	717	—	265,397	32·81	5·88	423
Thornfield and Gleneagles	455	15	230,884	29·00	8·82	3,877
Uda Radella	340	40	180,116	27·79	7·52	2,418
	2,563	105	1,104,168	30·40	7·00	9,230

Imperial Ceylon Tea Estates.—Nett profit £3,935-2-5. Dividend 4%.

The following table gives the acreage and results of the tea estates for the year:—

Estate.	Acreage in bearing. Full.	Partial.	Tea Crop. lbs.	Cost per lb. in cents (including manuring).	Nett price realised per lb. in pence.	Working Profit. £
Binoya ...	441	—	169,151	31·80	6·74	1,081
Edinburgh ...	306	39	168,439	27·55	7·47	2,602
Friedland ...	158	3	61,685	28·59	7·18	629
Mottingham ...	212	—	106,361	29·98	6·27	531
St. Vigeans	185	—	68,718	29·42	7·54	814
	1,302	42	569,356	30·40	7·00	9,230

Hope Tea Co.—Interim dividends two of 10%, final 5% making 25% for the year. Crop 14,662 maunds, average 8⅛*d.* per lb.

Hopetown Tea Co.—Crop 884 maunds, average As.6-82 per lb. Profit Rs. 6,457-9. Dividend 4%.

Rungamottee Tea Co.—Profit Rs.1,134-15-10. Crop 2,799 maunds, average 7*d.*

Chota Nagpore Tea Co.—Crop 83,570 lbs., average As.5·5 20p. Profit Rs. 13,122-4-11. Dividend 10%.

Doom Dooma Tea Co.—Crop 1,956,825 lbs., average 11 $\frac{23}{32}$*d.* Profit £26,347. Dividend 12½%.

NEW PROCESS OF TEA MANUFACTURE IN COLOMBO.

A SERIES OF INVENTIONS.

THE NEW VENTILATING FAN.

The *Times of Ceylon* says:—At Messrs. Davidson & Co.'s Sirocco works in Forbes Road, Maradana, Mr. F. G. MaGuire has just finished erecting a complete plant for the manufacture of tea by "hot process," and has put through the first break from start to finish. He manufactures on Tuesdays and Fridays; but on other days visitors will be welcomed. The factory is fitted throughout with nothing but Davidson's patent machinery, and includes several novel features. During a visit made this morning by a representative of the *Times of Ceylon* Mr. MaGuire explained these. First of all there is the new withering machine, which is the only one at present erected in the island, though previously a model one, with which experiments have been conducted, was set up on Polatagama estate in the Kelani Valley, and which existed all last year. The machine is capable of keeping two rollers going, and is driven by a new and ingenious engine which has proved quite a success at home. It is a high-speed engine without any packing, except on the piston ring. The governor and the valve also are both situated inside the steam chest, and this forms a special feature of the invention, for, as shown by Mr. MaGuire, the governor regulates the working of the machine to a nicety unapproached by an outside governor. The main bearing and crank shaft, too, are submerged in oil, and an indicator is fixed to the outside of the oil bath, to constantly show the depth of oil.

Even when wet leaf is put into the witherer, in an hour's time it is ready for the roller, and in three hours the whole process from green leaf to black tea—but not the grading, &c.—is completed. With the roller, experiments are now being carried on to effect an increased degree of pressure by means of interchangeable cones in the centre rolling table. From the roller the tea passes into an evaporator, the object of which is to decrease the percentage of water to obtain a good twist on the leaf in the second rolling. The machine is fitted with one of the new patent fans, encased and driven by its own little engine The down draft sirocco for firing is, of course, familiar to our readers; but at Maradana this also is fitted with a new fan, in place of a chimney for the blast. Besides requiring a far less quantity of fuel the driver now consumes its own smoke, so that nothing but clear gas issues from the shaft. Then at the other end of the room, is one of Davidson's large sorting machines and a Davidson MaGuire packing machine, on which this morning twenty acme chests were being placed in position to receive the first batch of tea to be sent to Belfast to be sampled and sold. In course of time some of the breaks made will be put on the local market; and experiments will be carried on for another month. The leaf from which the first break of tea has been made was bought from a native estate in Kaduganawa at 6 cents a lb; and Mr. MaGuire claims that from this inferior material he has made good tea. The tea continues hot from start to finish, and by this means it is asserted that after a few additional experiments, it will be possible to make tea of a penny per lb. higher value than by the old process, which besides the saving of time and fuel, would, naturally amply repay any additional outlay in machinery. There is the further valuable consideration that instead of an expensive three-storey factory a simple shed of one floor will suffice to accommodate the machinery for the manufacture of any quantity of tea Estates, it is expected, will send down leaf to be experimented with, as a practical way of testing what is claimed for the new method in improving prices. At the end of the office a laboratory has been fitted up in which chemical tests are carried on, and where with a powerful little miscroscope the leaf is examined in the various stages of manufacture.

THE "REVOLUTION" IN FANS.

Perhaps the most ingenious of all the new things to be seen a Messrs. Davidson's Works, however, is the fan. This was described in a letter in our paper of the 28th March, and the first shipment of eighteen ventilating fans arrived by the last Bibby steamer. These had been proceded by two fans for smoke chimneys, one of which has been sent to Balangoda for Messrs. Finlay, Muir & Co., and the other is going to one of the Haputale estates of Lipton, Limited. The eighteen ventilating fans were all of 30 and 35 inches diameter, and last night the remaining eight were booked—two by one firm, and six by another, the orders being for two fans in each factory. Another shipment is expected by the next Bibby steamer, when various sizes, from 15 inches to 35 inches, of the ventilating fans will come to hand. The new fans have not been advertised at home as yet, because, although the number turned out at Belfast is daily increasing, the existing demand can hardly be coped with. Before long, we are informed, 25 a day will be produced, and then the invention will be extensively advertised, and the production will be increased as quickly as possible to 100 per day. A contract has been obtained for the ventilation, and cooling and heating, of the Law Courts in London, which have always been in an unsatisfactory atmospheric condition; and the fans are to be used in connection with the scheme, which involves a separate plant for each court with refrigerating and heating apparatus for winter and summer respectively. The air will also be filtered, so that fog and other impurities may not enter. In addition to this the ventilation of the House of Commons is to be similarly improved; and exhaustive experiments were to be made a week or two ago by the Admiralty to see whether the new instruments did what was claimed for them, in which case Sir William White, the Chief Director of Naval Construction, had declared they would be adopted at once throughout the new vessels of the Navy. Information of the result of these tests has not yet come to hand. The flax and linen industry of Russia, which had been considerably pushed in recent years, and which requires fans for the benefit of the work people, has also produced a wonderful demand for the new patent, which, we are told, has been ordered in such numbers that the Russian market alone constitutes a very important element. It is in Ceylon, however, that the fans have been first advertised and first erected in different factories

To describe the fan, one of which, 30 inches in diameter, is already in position and working at the Maradana establishment, we may say that it involves an entirely new idea in practical engineering. The fan hitherto familiar to the public possessed blades extending from the circumference to the centre, and it follows, as a fact, that the maximum amount of work done by each blade is at the circumference, the force being lessened gradually until the centre is reached, where there is very little speed at all. Thus with any opposing pressure the efficiency of the old fan is greatly reduced, and air may even pass the opposite way through the centre, while the blades are doing their work at the outer edge. Davidson's patent may be described as shaped like a revolving squirrel cage, the blades being all of equal length round the circumference, and thus performing equal work throughout. By the same arrangement the space for the passage of air is as large as the fan itself, and the result is evident even to the lay mind, and is a marvellous advance on the old idea. An interesting feature is that the principle involved in the construction of the blades is in agreement with the contentions of professors, but contrasts with the experience of engineers in all other fans; and the new vindication of the scientific theory is to be shortly discussed at the Institute of Mechanical Engineers. The advantage of the machine is that, while the air emerges with greatly increased force, it enters in a regular and even manner, producing no disturbance in the vicinity. The air in fact is drawn from all directions as powerfully as from immediately in front, and thus a much greater area of space is under its action. The regularity of the entrance of the air was also shown when a funnel was fixed to the bracket which holds the fan. The atmosphere rushed into this in a full and regular steam, indicating the fan's great capacity for disposing of an unusual volume of air in a given time. The speed was tested at various distances and from various directions by an anemometer, and established the inventor's contention. The fan was then running, driven by a belt, at 380 revolutions a minute, and 10,584 cubic feet of air per minute were being drawn through. This entered at the rate of 2,000 feet, but was ejected on the other side at the rate of 5,530 feet. When reversed the fan does nothing. It may also be mentioned that the bracket

holding the fan has the shaft suspended like the axle of a bicycle, and the two bearings are in one piece, so that, even if carelessly erected by an inexperienced person, they cannot be put up out of line. On the outside a solid disc prevents high wind, or even a cyclone, disturbing its efficiency; and the air is discharged with equal force on all sides. The force of this air can be utilised for an upper loft by the fan being enclosed, and the air conducted to the storey above. The power used was only about ¼ h. p.

Close by the fan already in position preparations were going forward for the erection of a still larger fan, to be completed by this afternoon. Although no harm would result, it would be waste of energy to over-drive a small fan, and, according to the amount of work to be accomplished, machines of certain diameters are recommended. Mr. MaGuire further explained that the fans can be driven by electric motor and by water power, with new Pelton wheels recently patented by the inventor of the fan. A volume of photographs further shows the variety of uses to which the invention can be put; and other pictures represent some highly interesting tests, one of which, in competition with one of the older style of fans of three times its area, was fully described in our issue of the 28th March.

THE VANILLA BEAN IN MEXICO.

The State of Vera Cruz has been considered the home of the vanilla, but recent developments show that vanilla can be cultivated in the State of Tobasco and on the Isthmus of Tehuantepec. The true home of the vanilla, where it flourishes the best in its wild state, is a narrow strip about 30 miles wide, 5 miles from the coast, and 90 miles long. The upper end of this strip is about 50 miles south of Tampico, and extends along the coast 90 miles towards the city of Vera Cruz, the bottoms along the Tuxpan, Casonez, and Nautla rivers, and the creeks contiguous, constitute the richer parts. Here the cultivated varieties yield most without artificial fecundation, either on account of the number of wild bees in the locality or by self-pollenation, with some claim as impossible. The United States Consul at Tuxpan says that

ARTIFICIAL FECUNDATION

must be practised in order to produce the beans in commercial quantities. The vanilla plant is a vine of a bright green colour, with a smooth, waxy, transparent bark. It has a thick, waxy-looking leaf, light green in colour, 6 to 9 inches long, 1½ to 2 inches wide, and sharply pointed. The vine reaches out tendrils which cling tightly to its tree support, but do not, as some believe, draw nourishment from the tree. The best time to set out the vines, or rather cuttings, is in April or May. The cuttings are the vines divided into lengths, usually 2½ to 3 feet long. Some of these can be cut in two according to the number of joints. Two to three joints are sufficient to put under the ground, with the same number of joints above ground. The joints are easy to propagate, in fact, they are hard to kill if kept from being bruised. A cutting can be kept in the house on a dry shelf, and will live for months with scarcely any apparent change. In making a vanilla plantation much depends upon the selection of location. The first thing is to have the plantation where the pilfering of the beans while ripening can be prevented. A vanilla plantation need not be large; a few acres, with care and proper fecundation, will soon produce excellent results from a monetary point of view. Patient care and attention at the proper time is the chief secret of success.

THE VINE REQUIRES RICH SOIL,

heat, ventilation, shade, and moisture. Rich pockets of land along the creeks and river bottoms are best. A profusion of wild vines of all kinds growing into a jungle, with abundant loose soil affording ventilation at the roots, is the best proof of the adaptability of the land. The land should be free from sand on account of the drought, and free from clay, which would cause the vines to rot during the rainy season. There should be plenty of small trees, at the feet of which the vines can be planted. Trees which have smooth bark, and which never shed their bark or leaves, and grow to be no longer than 2 to 4 inches in diameter and from 7 to 10 feet high, are best for this purpose. Usually a variety of such grow on all wild lands, and any of them are good if the trunk of the tree be smooth, with plenty of sap. A small orange tree affords a good trunk for vanilla to grow to. If, while clearing the land, there be not enough of such trees found already growing, to plant the desired number of vines (there should be from 1,500 to 2,000 vines to the acre) enough should be planted, selecting the kinds that make the most rapid growth, which exist in abundance, and are destroyed by the thousands in nearly every new clearing of land. The ground should be kept clean from weeds. All under-growth should be thrown around the vines to decay and serve as manure for the roots. The ground around the roots should not be disturbed. One or two vines should be planted to each tree, and tied at first to the trunk with some flat, flexible band, such as strips of cocoanut leaves or plantain fibre. Round cord should not be used, as it is liable to cut and injure the green, succulent stem of the vine. Live-stock are never permitted on a vanilla plantation. The stems and roots of the vine are disturbed as little as possible.

THE VINE NEEDS NO CUTTING OR PRUNING,

and all other wild vines are cut out and kept from choking the vanilla vines. The trees should be topped to prevent too high a growth, so that the flowers can be reached from the ground. Light and ventilation beneath, shade from the sun above, rest and plently of moisture – but free from standing surface water— are the prime requisites for the growth of vanilla vines. One peculiarity of the vine is that after three or four years' planting, the stem will rot off at the roots, and continue to rot three to four feet up the vine, while the top looks green and flourshing. In the meantime, from above where it is going to rot, it shoots out fine little rootlets like threads, and continues them to the ground. So delicate are these threads running along the trunk of the tree, and so prominent the rotted off end of the stem, that it gives the vine the appearance of living independent of the earth, thus giving rise to the theory that it is an air plant. It will sustain itself in a severed state, but to make material growth and fruitage it must connect itself with mother earth. The new vine will commence bearing the third year from planting, and full crops may be expected the fifth year. A vine will bear from 15 to 45 beans a year. Some vines have been known to produce as much as 65 beans at one time. Twenty beans to a vine is a good average. Rarely do those who grow the beans cure and market their crops. Some buy the green beans and make a business of curing and exporting them. Consul Jones says that judging from the way they all get rich at the business, and the difference between the price at which they buy the green bean and the price at which they sell the cured, there must be more profit in the curing than in the growing. Still, in view of the price of vanilla, and the demand for it all over the world, there are large profits for both parties. Wild lands suitable for vanilla can be bought for £1 to £2 per acre. There are vanilla-producing plantations in the vicinity of Papantla that could not be bought

FOR £100 PER ACRE.

Various estimates have been furnished as to the cost per acre of converting wild lands into vanilla-producing plantations. Approximately, £17 an acre is correct, which is very moderate for so profitable a plant. The greater part of the vanilla in the district of Tuxpan is grown about Papantla, much of which is exported from Vera Cruz, it being easier to reach Vera Cruz by water than Tuxpan by land. The two busy seasons of the year are during the pollenation months—March, April and May, and the gathering months—November, December, and part of January. During the balance of the year the plantation should have absolute rest, other than keeping down the weeds and undergrowth. Many of the beans are gathered in October, sometimes before they reach their growth, by those who see an opportunity of gathering them unknown to the owner, or by the owner, for fear of losing them, because he has not his vines where he can watch them. Beans gathered too soon are woody and inferior in quality, lacking the oil that furnishes the flavour. Good ripe beans lose but little of their weight while curing; 5 lbs. of green beans will weigh 4⅓ lbs. when cured. The quality and flavour are increased by allowing them to mature and by the proper curing. The curing is principally done by Spaniards who have followed this business. The process adopted is slow and laborious. The secret is to evaporate the water while retaining the oil, and to take care not to injure the flower. Vanilla is principally exported from Mexico to the United States—about £400,000 worth annually.—*Journal of the Society of Arts*, April 21.

COFFEE CULTURE.

Some interesting facts about coffee are printed in the second number of a little magazine called "*The Brazilian Bulletin*," the organ of Mackenzie College in Brazil. The writer of the article was able to learn little of the early history of coffee, although it has been in use at least 1,000 years. The very origin of the name by which the little berry is known is obscure. It has been said that the word came from the Arabic *kahwah*, but this is a doubtful conclusion, as coffee did not originate in Arabia. A somewhat better explanation is that it took its name from Kaffa, in Abyssinia, where it is found growing in a wild state.

The coffee plant belongs to the genus *coffea*, and is an evergreen. It usually grows from a single shaft, although sometimes six or eight slender trunks form the plant. Its leaves are smooth and dark green and the flowers of the plant are fragrant and white. The berries themselves, the essential part of the plant, are formed in clusters of from three to twelve in number, and have very short stems or none at all. In size the berries are, when ripe, about as large as the ordinary cranberry, and they resemble that fruit rather closely also in shape and color. In each berry are two little seeds, each a little irregular half-sphere, surrounded by a yellowish, sweet pulp that must be removed by one process or another. The berries must be polished to put them in shape for the market.

Those familiar with the produce market may remember seeing the expression male-berry, or pea-berry. Sometimes the berry contains only one seed, which is almost round, and this seed has taken the name "male." Much of the Mocha coffee is of that sort, and it is found in several places to some extent.

In the several varieties of coffee there is no very great difference, and what there is may be the result of differences in climate and other conditions that affect fruits in general. The *Coffea arabica*, as it is known in science, is a shrub from four to eight feet high with leaves a little broader than those of the common Brazilian native plant. The *Coffea liberica* is a tree in size and appearance and often reaches the height of thirty feet. The plant can be grown anywhere beyond the reach of frost, and where there is not excessive dryness or moisture. It thrives best on the steep slopes of mountains, about 1,000 feet above the sea-level. It has thrived, on the other hand, on the Brazilian plains and other lands that are properly drained for the purpose.

The planter has to wait from three to five years before his young trees begin to bear to any extent. The richness of the ground in which the plant is placed is an important factor as to this. Trees, if properly cared for, will bear good crops for twenty or thirty years, and even longer in many places. In many of the coffee producing countries the average tree yields only a little more than a pound to a crop. In Brazil the average yield of a tree is anywhere from three to six pounds. The advantage of the Brazilian growers, if this statement is accepted, is evident. The comparison made by the writer is given here:

"The rapid decline of coffee planting in the West Indies," says the article, "and its total failure in Ceylon and many other parts of the East, leave Brazil with but few strong competitors. Brazil now produces two-thirds of all the coffee in the world."

When one reads of coffee and its market, one finds many confusing names used to designate the different kinds of the berry. These names refer to the place from which the berry is shipped. Practically, all the coffee in the market belongs either to the Liberian or the Arabian class. The Brazilian Government has spent much time and money in the effort to introduce into that country the best plants, and there are now large plantations in Brazil where nothing is grown but pure Java coffee, from imported seeds, and others where nothing but the pure Bourbon or the pure Mocha is produced.

Adulteration of coffee is a common practice among merchants. An almost endless variety of ingredients, none of a harmful nature, are used to cheat the buyer. Among the ingredients used are chicory (which is the best known), carrots, dandelion root, barley, buckwheat and corn. These ingredients do not contain the caffeine, or theine, the particular chemical part of the berry that is pleasing and beneficial; they are found, too, only in the ground coffee, although some disciple of the wooden-nutmeg-way of doing business did actually counterfeit the green berry during the recent reign of high prices, by moulding a mass of some unknown ingredients into the shape of the coffee berry and then flavoring it with extract of the real article. Low prices, however, do away with adulteration.

The writer gives high praise to the healthful qualities of coffee. This is what he says: "As a beverage, coffee is valuable for its stimulating influence upon the system; it produces a buoyancy of feeling with no unpleasant reaction, lessens the sense of fatigue and sustains the body under prolonged muscular strain. Coffee contains less tannic acid than tea, and does not disturb digestion; it refreshes and stimulates, while it retards tissue. If the seed is roasted to a reddish brown it loses 16 per cent. in weight and gains in bulk 30 per cent. If the roasting is carried on until the berry is a dark brown it loses about 20 per cent. in weight and gains 50 per cent in bulk. In roasting the percentage of caffeine is lessened and the aroma increases. This aroma is a fleeting quality of the coffee, for it fades away quickly if the berry is kept long after being roasted, and to preserve this quality the roasted coffee of trade is covered with some substance, such as the white of eggs."

In Brazil, the host tenders to a visitor the cup of coffee, as in Japan and the East the cup of tea is offered. This coffee is ground and roasted on the spot every time it is served. The Brazilians know how to prepare the drink, too. Instead of steeping it or boiling it, they pack the finely ground berries in a conical bag, and pour two draughts of boiling hot water through the mass. That makes a real cup of coffee.

The writer observes that the Brazilian coffee-growers, in many instances, have been addicted to furnishing quantity rather than quality to the consumers, and also, that the expense of production has been against them as compared with planters in other countries. This, it is hoped, will change in time, for coffee is a crop that the small farmer, who has not appeared to any great extent in Brazil, can more easily raise. One farmer can easily take care of from 2,000 to 10,000 coffee trees while he is cultivating his corn, rice, beans, and other products and caring for his cattle. While the price of coffee was high, the Brazilian planters almost invariably raised that crop exclusively, and thus lessened their income; when the price of coffee went down, the Brazilian planters were left in the lurch, and could not get their coffee to market without a loss.

When the coffee area in Brazil was somewhat limited, the crop was open to the dangers of excessive and sudden changes of the climatic conditions. Now, the area devoted to coffee is so large that no purely local accident or mishap can ruin the crop entirely, and the range of latitude in the area is so great that, when the coffee plants are blossoming in one part of Brazil, the ripe fruit is gathered in another. Thus, the market is supplied throughout the year.

"It is a singular fact," the author says, "that while English and German capital has been attracted to the coffee industry of Brazil, and large sums have been invested, American capital and enterprise have not seen this fine opening; which is particularly attractive to the small farmer, but have been looking up the same thing in the Sandwich Islands and Mexico, where the conditions are less favorable."

The inducements offered to the small farmer of coffee are attractive. The process of laying out a coffee orchard is described as very simple. The farmer first cleans the virgin forest by cutting down the trees in his way. When the trees are dry they are burned and the land is divided off into squares. This can be done, it is said, at an expense of from $37 to $54 an acre. The holes for the plants are dug from eight to twelves feet apart, and from six to eight inches deep. The process of planting is varied by the planters, some preferring to plant young trees that have been started in nurseries, others to plant the seeds in the orchard. Two or three seeds are put into each hole, which is covered with a roof of bark or chips, and this is kept on until the plant can bear the hot sun. Corn and beans can be planted between these holes for the first two years. The coffee tree at bearing age has cost the small farmer from about 27 to 54c. The small farmer can give to his coffee a degree of attention not possible on a large estate.

THE MARCH COFFEE MOVEMENT IN THE STATES.

The March deliveries of coffee in Europe and the United States were heavier than for any preceding month during the present trade year: in fact, if April and May of 1898 are excluded, when coffee was withdrawn to anticipate a duty, they are the heaviest for any month on record. It is evident that low-priced coffee has very largely increased consumption. Formerly tea was the cheaper beverage, but now it is coffee, and the result is that it has become the most popular drink in the United States.

Based upon the records of the United States Bureau of Statistics, we are enabled to compile the following table showing the beverages most in favor and their comparative use, for the fiscal year ending June 30, 1898:

	Gallons.
Coffee	1,324,250,520
Liquors, all kinds	1,266,804,738
Tea	547,890,180

The above estimate is made by taking the average yearly net imports of coffee for two years, allowing 16 per cent. for shrinkage in roasting and estimating that every pound of coffee makes two gallons of beverage; while every pound of tea is estimated to make six gallons of infusion.

From the April 1 report of the New York Coffee Exchange we compile the following table showing the deliveries in the United States for the first three months of 1899, as compared with the same period in 1898:

	1899.	1898
January	568,087	560,754
February	431,321	452,505
March	673,133	531,284
Total three months	1,672,541	1,544,543

The following table shows the movement and supply during March:

	Bags.	Bags.
Total stocks, March 1, 1899—		
United States	1,277,057	
Europe	3,687,987 =	4,965,044
Arrivals during March—		
United States	605,675	
Europe	729,353 =	1,335,028
Total supply, March 1, 1899		6,300,072
Less stocks, April 1, 1899—		
United States	1,209,599	
Europe	3,773,959 =	4,983,558
Deliveries, March, 1899		1,316,514
Deliveries, February, 1899		1,046,961
Deliveries, January, 1899		1,132,355
Deliveries, December, 1898		1,260,445
Deliveries, November, 1898		1,131,930
Deliveries, October, 1898		1,050,270
Deliveries, September, 1898		1,131,838
Deliveries, August, 1898		963,052
Deliveries, July, 1898		822,450
Total deliveries, 1898-99		9,855,315
Total deliveries same time 1897-98		10,415,395
Total deliveries same time 1896-97 ...		.. 9,060,399
Total deliveries entire year 1897-98		14,571,902
Total deliveries entire year 1896-97		12,244,204

The total visible supply of the world on April 1 was 6,515,558 bags, against 6,174,766 bags at corresponding date in 1898— a gain of 340,792 bags, but 85,205 bags less than January 1, 1899, and 613,242 bags smaller than on November 1, 1898, when the total visible supply reached the highest point on record, or 7,128,800 bags

The total receipts of Rio and Santos coffee from the crop of 1898-99 (July to March) were 7,503,000 bags, or 1,660,000 bags less than for the same time in 1897-98, but 90,000 bags more than in 1896-97.

The official spot quotation of No. 7 Rio in March was 6 1-16 cents (the lowest) and 6 3-16 cents (the highest), against 6½ to 6¾ cents in February, 1898. Fair to good Cucuta brought 8 to 8¾ cents, and Padang Interior 24½ to 25¾ cents.

It is worthy of note that the monthly deliveries from last September to April 1 show no such wide differences as marked those during the spring of 1898, when the duty question was before Congress. As they declined below the average during June, July, and August, it is reasonable to conclude it was due to the excessive withdrawals in April and May, and that the deliveries for the past few months represent the normal requirements of the country.

It is apparent that the receipts of Rio and Santos in 1898-99 will be close to 9,000,000 bags, being about 1,500,000 bags below the crop of 1897-98, but larger than any preceding crop. If the 1899-1900 crop is up to or beyond the average crops of the past three years, there need be no fear of much of a rise in coffee. In fact, if the supply should be very heavy, coffee might go lower. The present visible supply is equal to nearly one-half the yearly production of the world, and an insurance against any radical upward movement. The cost of carrying this visible is no greater than at the time when it was one-half less.—*American Grocer.*

DISTRICT ASSOCIATIONS.

NILGIRI.

Proceedings of the Annual General Meeting of the Nilgiri Planters' Association held at the Masonic Hall, Ootacamund, 10th May, 1899. PRESENT:—Messrs. Wapshare (*Chairman*), W. L. Edmiston, J. Harding Pascoe, A. L. Alexander, T. Kenna, A. S. Crum, J. T. F. Wilson, J. Stanes, H. Sheldrich, S. Bayley, the Honorable Mr. H. Percival Hodgson, and Mr. E. G. Windle, Honorary Secretary.

1. Proceedings of last meeting were taken as read and confirmed.

2. The Honorary Secretary's Annual Report and Statement of accounts were read as follows:—

"MR. CHAIRMAN AND GENTLEMEN,—The Annual Report for 1898 is as follows:—At our last Annual Meeting the number of members was 74. During the past year 4 have left the District, whilst 3 resigned, and 2 were unable to continne their subscriptions, owing to the hard times. Two new members have joined, so that our number is now 67. Accounts for the year are:—*Receipts:* Balance on hand on 1st January, 1898, Rs.567-13-11, Subscriptions received for Lady-bird Fund, Rs.1,850, Other subscriptions, Rs.847-1-0, Due to Honorary Secretary, Rs.123-4-10; total, Rs.3,388-3-9. *Disbursements:* Remitted to Lady-bird Fund, Rs.2,125, Balance of Subscription to U. P. A. for 1897-98, Rs.272, Part of Subscription to U. P. A. for 1898-99, Rs.250, Delegates' expenses, Rs.200, Writer for 13 months, Rs.260, Mr. Kenworthy Brown, Rs.52-8, Rewards for Coffee Theft cases, Rs.45, and General expenses, Rs.183-11-9; total, Rs.3,388-3-9. With reference to the balance due to the Honorary Secretary, there were 19 subscriptions unpaid for 1898, which will more than cover this amount. The accounts have been audited by Messrs. Gerrard and Morgan and are laid on the table. The proceedings of the U. P. A. will be familiar to you all. We cannot sufficiently regret the complete failure of the experiment of importing Lady-birds, an experiment to which the members of this Association contributed so largely. The reason of the failure is not evident; the most likely supposition appears to be that the thawing out of the Lady-birds was not sufficiently gradual. No further action has yet been taken, but the matter will not be allowed to drop, and, in the meantime, some useful information has been collected, whilst further efforts will no doubt have the advice and assistance of Mr. Barber, the lately appointed Government Botanist.

In the matter of an Agricultural Chemist, the Mysore Government has been the first to show the way, and we may hope to hear from Mysore planters at the Bangalore Conference how the new departure is progressing. The sittings of the Currency Commission still continue, and planters will notice with satisfaction that a large number of experts agree with them that the re-opening of the Mints is advisable. The results of the Planters' Enquiry Commission have now taken shape in the form of orders passed by the Government of India, requesting the Madras Government to draw up a Labour Ordinance for the relief of the special disabilities dealt with by the Commission. From the sympathetic attitude which the Madras Government has consistently shown to planters in this matter we may be assured that no unnecessary delay will take place and that any representations made by the Planting Member of Council during the inception of the Bill will be carefully considered. The Association views with some alarm a tendency on the part of Government to reduce expenditure on the District roads; this was shown by its desire that the services of the D. B. Engineer should be shared with the Ootacamund Municipality, and by

the allotment of a portion of the current up-keep funds to expenditure in plague precautions. Those who live in a Hill District are well aware of the outlay necessitated by sudden storms and steep gradients, and this Association earnestly deprecates what it must consider to be a retrograde step. We have been fortunate in escaping the plague hitherto. All possible precautions have been taken by the Collector, and information circulated as to the proper steps to be taken both to avoid and treat the disease. The opening of the Nilgiri Railway is still in the future. Coffee thefts have been few: in those detected the Association has gratefully to acknowledge the energy of the Police, to whom a reward has just been paid on the strength of the recommendation of the District Magistrate, Coimbatore, when delivering judgment in an appeal against a conviction for theft by the Acting Head Assistant Collector, Mr. S. G. Roberts. Postal irregularities are as numerous as ever, but your Honorary Secretary having failed to obtain any satisfaction in any one of the numerous complaints sent in by him, can only suggest that the Director-General of P O. in Calcutta be addressed on the subject. The past season for coffee was a good one, as far as quantity of crop was concerned, in the greater part of the district, but quality generally was indifferent, whilst the fall in prices besides being the most rapid and severe experienced during the last 25 years has reached an unprecedentedly low level. Offers during October, 1898, were at the rate of Rs.1,000 per ton uncured, whilst in March, 1899, the prices fell to Rs.640 per ton, and in some cases no offer could be obtained. The main reason for the fall was of course the swamping of the markets by the large Brazilian crops, but it was and has been noticeable throughout that a very few really fine marks of E. I. coffee, to a certain extent, maintained their values. That quality, for the past two or three years, has, as a rule, been poor, is undoubted, and this brings us to the question as to whether the deterioration is due to causes entirely or partly within our control. We are agreed that the bean cannot develop normally without a sufficiency of moisture, and some consider that the partial failure of the monsoons sufficiently accounts for poor quality. Leaf-disease was worse last year than it has been for some time, but the attack came on too late to affect the quality of the bean, which has suffered on highly cultivated estates equally with others on which less work was done. Another opinion is that the artificial cultivation combined with leaf disease during a long term of years has deteriorated the plant, and that a remedy is to be sought by introducing other strains, in other words, new blood. The subject of deterioration has been discussed by this Association and will be brought up again to-day; it is needless therefore to dwell upon it further here. One thing is certain, that coffee planters must reduce all expenditure to the lowest possible level if they are to pay expenses, with present prices, and that other products should be carefully looked for. In any case, a continuance of these prices, which seems but too probable, must mean ruin to many and the survival of the fittest. Prospects for the coming season began fairly, though even at low elevations the coffee would have been the better for another fortnight of dry weather. Blossoms, however, were on the whole good, but the remarkable burst of monsoon weather as the flower opened injured it considerably and spoilt the setting of much of the blossom, estimates of damage done on different estates ranging from 7 per cent to 80 per cent. The attention of coffee planters is drawn to Mr. John Cameron's report of his visit to Coorg It is to be hoped that he will publish regular accounts of the experiments in hybridising which he alludes to, and which we would have liked to have heard more about. A careful periodical report by Mr. Cameron on Mr. Mockett's Mysore hybrids would be most interesting and would probably advance coffee culture more than anything else. At present such different accounts of the results obtained by Mr. Mockett are in circulation that planters are uncertain as to what to believe. but there is no doubt that a report from a practical botanist would do much to clear up doubts. The year 1898 as regards prices for tea in the home market has been one of the worst experienced by planters for some time; happily at the date of writing these remarks prospects are much brighter In the words of Messrs. Gow, Wilson and Stanton, who make tea statistics a specialty, "The tea-producing industry has been passing through a severe crisis," from which let us hope it has emerged. The average rate of exchange during 1898 was 1*s.* $4\frac{3}{16}$*d.* against 1*s.* $3\frac{15}{32}$*d*, in 1897, and the average price for *all Indian* teas in 1898 was 8 30*d.* per lb. against 9 in 1897. A glance at figures will show that the year 1898 compares unfavourably with these the previous year both as regards exchange and price of tea. The statistical position of tea is now very strong. Some six million pounds of British grown tea was consumed in the United Kingdom in 1898 in excess of the previous year, while new markets took ten million pounds in 1898 in excess of 1897. These figures are most encouraging. At the present time consumption has more than overtaken production.

Referring more especially to our own District (the Nilgiris and Wynaad) the season 1898 as regards yield can hardly be termed a favourable one owing to partial failure of North-East rains, nor were the prices obtained for Nilgiri Teas in Mincing Lane Market with a few exceptions what high grown flavory teas should fetch. Those best entitled to speak on the subject attribute this to want of attention on the part of large buyers being given to small breaks, whilst others with whom this Association is inclined to agree, attribute it to the fact of some gardens not having fully equipped factories, and more especially inadequate withering accommodation, which latter is against the production of good teas Wynaad planters have every reason to be pleased with the prices now being obtained for their teas, which with the large yield per acre obtained in that district and consequent cheap of production leaves a fair margin for profit. Cinchona prices have greatly improved, and in spite of the recent re-action, the position is good, with a fair prospect of its continuance if not of a further improvement. Unfortunately, there are comparatively few plantations left in this district. This Association notices with regret that Government has resumed planting operations. The Association, whilst regretting the illness which led to the loss to the district of its late Collector, Mr. Butterworth, must congratulate itself on the good relations existing between its members and the courteous district officials. The resignation of the Honorary Secretary and Committee are now placed in your hands."

The Report and Statement of Accounts were passed.

3. Mr. E. G. Windle was re-elected Honorary Secretary, and the following gentlemen were asked to serve on the Committee:—The Honorable Mr. H. Percival Hodgson, Messrs. Wapshare, Nicholson, Edmiston, R. James, Mullaly, J. Stanes, T. Wilson, Wilbraham, Sheldrick, Grey, Pascoe, Buchanan, and A. K. Haji Fakeer Mahomed Sait.

4. **Delegates to U.P.A.S.I. Meeting.**—Messrs. Edmiston and Windle were elected.

5. **Proposed Labour Ordinance.**—The Honorable Mr. Hodgson reported progress to date.

6. **Mr. J. Cameron's Report of Visit to Coorg.** Recorded. Copies can be obtained at the "P. O." Office or Messrs. Higginbotham & Co. Price 8 annas.

7. **Adulteration of Coffee.**—Read letter from Secretary, U. P. A., and copy of Honorary Secretary's reply, dated April 14th, 1899. Resolved, the Honorary Secretary's reply is approved of and that the matter be referred to the U. P. A. S. I. with the support of this Association.

8. A reward of Rs 25 to Inspector Brito, for his services in working up coffee-stealing case, was passed.

9. **Deterioration of E. I. Coffee.**—Mr. Hodgson introduced the subject, comparing E. I. curing with S. American methods. Messrs. Stanes and Windle mentioned that enquiries in London went to show that the latter mode of curing would not suit E. I. coffee. Resolved, that the subject be brought up for discussion at the Annual Meeting of the U. P. A. S. I.

10. **Importation of Lady-birds.**—This was also brought up by Mr. Hodgson, who referred to the success attending the sending of Lady-birds by post from the Cape to Ceylon. The Honorary Secretary was asked to write to Mr. H. O Newport, requesting him to forward a trial consignment by this method.

11. **Planting Produce at the Paris Exhibition.**—Read letter from Secretary, U. P. A., dated 11th April 1899. The Honorary Secretary was requested to write to the Secretary, Indian Tea Association, asking if a coffee-room can be established in conjunction with the proposed tea-room, and the probable expense of so doing.

12. **Indian Tea in Australia.**—Read letter from Secretary, U. P. A., dated 18th March 1899. Recorded.

13. Plague notice issued January 27th, 1899, by S. G. Roberts, Esq. Recorded.

14. **Madras Land Bill.**—Letter from the Collector, Nilgiris, dated 18th March 1899. Resolved, that the matter be referred to the Planting Members of Council.

15. **Export of Indian Tea.**—Letter from Secretary, U. P. A., dated 19th April 1899. The Honorary Secretary was requested to write to coast agents asking for figures.

16. **Postal Irregularities.**—Proposed by Mr. Edmiston, seconded by Mr. Sheldrick, that complaints of mistreatment and non-delivery of letters, etc., througout this district being now so frequent, members of this Association do in future collect and forward to the Honorary Secretary such covers as may have been wrongly dealt with and full particulars of such cases of non-delivery as may come within their notice, to be forwarded to the Director-General of P. O. Carried unanimously.

17. **Lowering Rates of Labour.**—The Honorary Secretary mentioned that it was proposed in the Kotagiri district to lower rates of pay, and that he was convinced this could be done and would be done with local labour, but that if imported labour was to be dealt with other districts tapping the same sources of supply must join. The Honorable Mr. Hodgson thought that rates could not be touched.

18. A vote of thanks to the Honorary Secretary for his sevices was passed unanimonsly.

A vote of thanks to the chair closed the proceedings.

N.B.—Local rates of pay have now been reduced on the Kotagiri ghaut to Rs.5-8 a month for men and Rs.4 for women, and have been accepted. Imported labour has also been warned of a reduction. It is hoped that other parts of the district will combine to effect a similar saving. Contractors' rates are also being reduced.

MARKET REPORT.

By Mail advices of 28th April, 1899.

COFFEE.

The *London Commercial Record* says:—The supplies at auction continue far in excess of the time available for their disposal and there are consequently considerable arrears which have yet to be offered. The position was made worse yesterday by the dark state of the atmosphere in the morning, preventing samples being properly examined, and only a small portion of the quantity due to be offered was brought to the hammer. Practically there is no material change in the position of the market, as there has been a continued good demand for all colory qualities. with an occasional advance for the superior samples, whilst grey and inferior grades have again been very difficult of sale at rather easier prices. Ceylon brought prices over those obtained for similar quality of other growths. Jamaica was cheaper. There have been slight fluctuations in the market for futures, closing about 3d to 6d cheaper, *viz.*:—

London	Santos	July delivery	28s 3d
New York	No. 7 Rio	„ „	5.15 cents.
Hamburg	Santos	„ „	28¾ pf.
Havre	Santos	„ „	34¾ francs
Holland	Good ordinary Java		27 cents.

Imports, Deliveries and Stock of Coffee in London are as follows:—

		Stock.		Imports.

In the Imports an increase this year of	31 tons.
Home Consumption an increase of	279 „
Export a decrease of	265 „
Stock an increase of	4,863 „

Auctions this week have passed off as under:—

Ceylon.—*Plantation.*—7 casks 7 tierces 14 barrels 14 bags sold—smalls 43s 6d to 47s, medium to bold brownish 55s to 70s, low middling 86s 6d to 96s 6d, bold 104s to 108s, pea-berry 55s to 104s.

East India.—6,530 bags mostly sold as follows:—*Mysore*, smalls 30s to 70s, low middling 51s 6d to 55s, middling to good middling 60s 6d to 73s, dull bold 79s to 82s, good to fine 98s to 112s, pea-berry 55s to 114s; *Coorg*, smalls 35s to 43s, low middling gray 50s to 56s 6d, middling to good middling 57s 6d to 67s, fine middling 83s bold faded gray 79s to 80s, good to fine colory 83s to 101s, pea-berry 73s to 100s; *Shevaroy*, smalls 45s, low middling 49s 6d, bold 71s, pea-berry 70s; *Naidoobatum*, small 39s 6d to 48s, low middling to middling 57s to 66s, good middling 71s 6d, bold good to fine 91s to 104s 6d, pea-berry 89s to 107s 6d; *Neilgherry*, smalls 30s to 45s 6d, low middling to middling 52s to 60s, bold 72s 6d to 88s 6d, pea-berry 60s to 77s 6d; *Wynaad*, smalls 43s, low middling 52s to 55s, bold 73s to 78s 6d, pea-berry 72s; *Nelliampathy*, smalls 41s, low middling 52s 6d to 53s, bold 75s 6d.

Jamaica.—Of 91 barrels 191 bags offered a small part sold, ordinary greenish 30s, good to fine fine ordinary 38s to 44s 6d, middling blue 60s, pea-berry 37s to 50s.

Costa Rica.—3,914 bags mostly sold, smalls 37s to 39s 6d, ordinary to good ordinary brownish 32s to 39s, fine ordinary 40s, low middling dull 47s 6d to 52s 6d, middling to good middling 57s to 69s 6d, fine middling 75s 6d to 76s, bold good to fine blue 77s to 85s 6d, very fine blue 97s 6d to 100s, pea-berry 70s 6d to 105s 6d.

New Granada.—272 bags about half sold, fine fine ordinary dull greenish 40s 6d, middling ditto 49s 6d, bold 62s 6d, pea-berry 42s to 54s.

Salvador.—138 bags about half sold—middling soft blue 49s, good bold mixed 65s, pea-berry 75s.

Columbian.—300 bags mostly sold, fine fine ordinary to low middling gray 41s 6d to 46s, middling to good middling greenish 47s 6d to 56s 6d. good bold 60s, fine medium hard gray 72s 6d to 73s.

Cuban.—Of 128 bags offered 67 bags sold, smalls 34s 6d, good middling 61s, bold good 80s 6d, pea-berry 75s.

Vera Paz.—Of 517 bags catalogued 200 bags sold, middling bright gray 57s to 58s, fine medium blue 84s 6d to 85s, bold good hard gray 84s, very fine blue 104s 6d, pea-berry 75s to 90s.

Nicaragua.—414 bags sold, smalls 37s 6d, middling to good middling 55s to 59s, good bold 78s, pea-berry 83s.

Mexican.—222 bags sold, smalls 33s, low middling 44s to 46s 6d, pea-berry 46s 6d.

Receipts in Rio and Santos.

TEA.

INDIAN.—There was a considerable shrinkage in the amount brought forward at public sale, the total being 14,100 packages contrasted with 24,400 packages in the week before, and 31,500 packages for the corresponding period of 1898. Demand was not very brisk and dealers generally were disinclined to operate at previous rates Importers on the other hand being unwilling to accept any marked reduction a large proportion was withdrawn. Prices in the case of desirable liquoring invoices did not shew much change, but others as a rule sold at a further decline of ¼d per lb.

For 11,000 packages on garden account 9⅜d per lb. was obtained *versus* 8⅛ per lb. for 19,800 packages, and 7¼d per lb. for 8,700 packages in the two preceding years.

Totals printed during April:—

1899.	1898.	1897.
61,200 pkgs.	74,300 pkgs.	35,100 pkgs.

which will make the quantity put through the Mincing Lane Auction Room from 1st July 1,457,000 packages, against 1,455,000 packages last season.

CEYLON.—Only 17,500 packages were offered on Tuesday, opposed to 27,200 packages on the 18th inst., and 35,400 packages a year ago. Notwithstanding these limited supplies competition was somewhat restricted and quotations tended in favour of buyers, especially for Pekoe Souchongs and Pekoes drawing light infusions, which were ½d per lb. lower. Biddings for the better grades were mostly disappointing and as these are now comparatively cheap, it is to be hoped that they will shortly receive more attention from the trade.

The average is 8½d per lb. On the 20th inst. it stood at 8⅝d per lb. and 7¾d per lb. in 1898.

Catalogued for the month comprised:—

1899.	1898.	1897.
74,400 pkgs.	80,100 pkgs.	63,500 pkgs
(Avge. 8¼d per lb.)	(Avge. 7⅝d per lb.)	(Avge. 7¼d per lb.)

JAVA.—Rather under 400 packages of direct import passed the hammer, but without much alteration in values to notice. For the 1st and 8th prox. 512 packages and 331 packages are declared.

Offerings in April were :—

1899.	1898.	1897.
4,000 pkgs.	3,700 pkgs.	5,000 pkgs.
(Avge. 8¼d per lb.)	(Avge. 6d per lb.)	(Avge. 6d per lb.)

Deliveries.—The clearances of all tea (on which duty has been paid) from the London warehouses, as per official returns, were :—

From 1st to 25th April, 1899 ... ... *19,630,586 lbs.
„ „ 1898 ... ... 13,744,505 „

During the week the following have been printed for sale by public auction :—

	Sold.	Withdrawn	Total offered.
	Pkgs.	Pkgs.	Pkgs.
India ...	... 10,789	3,342	14,131
Ceylon ...	... 15,026	2,526	17,552
Java ...	... 368	—	368
Total ...	26,183	5,868	32,051

Also 453 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated April 28th, 1899, states :—

QUANTITY BROUGHT TO AUCTION IN LONDON
FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1898-1899 ...	1,520,420 pkgs.	1,017,519 pkgs.	43,311 pkgs.
1897-1898 ...	1,502,327 „	1,083,576 „	40,715 „

14,787 pkgs. Indian
17,686 „ Ceylon
368 „ Java
} Total 32,841 packages were offered in public auction this week.

Imports, Exports, and duty payments of Tea from 1st of June to the end of March are given below as shown by Custom House figures. Between that date and the 13th April duty was paid up on lbs. 14,860,778 mainly as a precaution against any possible increase in the duty, as against lbs. 5,784,410 during the same period last year.

Indian. The small auction passed with a slightly easier tone, a decline of a farthing per pound being frequently noticeable, many parcels being in consequence withdrawn. Apparently there is only a small amount of Indian Tea to be brought to auction during the remainder of the season, and the sale advertised for next week is less than 10,000 packages. The corresponding sale last year amounted to over 30,000 packages. During the whole of May, 1898, close upon 90,000 packages were catalogued.

Ceylon. A further general decline of ¼d. to ½d. per lb took place; but at these prices buyers operated readily. Teas over 8½d. per lb. are now as cheap as they have ever been, taking their good quality into consideration. Such teas did not receive any benefit from the recent advance, and as the decline above mentioned is general, such kinds are actually cheaper than they were some two or three months ago. Average for week 8·42d., against 7·81d. last year.

Ceylon Tea sold on Garden Account, 1st Jan. to date 1899, 331,175 pkgs., av., 8·47d. 1898, 372,059 pkgs., av., 7·63d.

Java. The small quantity brought forward was mostly sold at prices showing about a half-penny decline from the highest point of the market.

Bank rate 3 per cent. Exchange on London three months sight :—Calcutta 1/4 5/32. Colombo 1/4 5/32.

IN CANADA.

Cable advices immediately imparted a stronger tone to the stocks held on spot. During the past week there has not, however, been as many transactions between brokers and wholesalers as there was from the fact that stocks held by the latter are now fairly large, and in view of this, together with the hope they have that the present high range of values on low-grade teas will not exist for a great while longer, has caused them to be less eager buyers. A letter, however, received from Colombo, states that there are no prospects of a fall in prices for some months to come. "With the prevailing drought," states this letter, "planters find difficulty in making up estimates, and, unless we get some rain, some experts predict another shortage this year." On the local market, there have been, during the past week, transactions in low-grade Indian and Ceylon teas at 16c. which cost 12½c. within the last month. At the prices prevailing in London it would cost something like 19 to 20c. to lay down the lowest priced teas which are now selling on that market. There is very little being done in Japan teas, either from spot stocks or for future delivery.

COCOA.

Auction on Tuesday comprised 5,384 bags which quantity produced a very poor enquiry, even at an irregular decline in value of from 6d to 3s per cwt. No more than 1,900 bags sold under the hammer, but subsequently a fair proportion of the bought-in lots found buyers. Of 1,648 bags Trinidad offered 750 bags sold at 1s to 2s decline, viz., superior red 78s to 79s, good to fine ditto 71s to 75s, fair 70s, pickings 56s, black 53s. 121 bags fine red Grenada were quoted at 69s to 70s, a depreciation of 6d to 1s per cwt. 120 bags Jamaica retired unsold. 469 bags Bahia rather more than half sold at 68s for fair, being 1s below valuation. Of 437 bags Guayaquil catalogued, 20 bags old landed summer Arriba, wormy, sold at 72s. 43 bags Samana, 465 bags Venezuela and 66 bags African passed the hammer unsold. Ceylon was again well represented, the catalogues embracing 2,252 bags, but not much enthusiasm was evoked, barely 350 bags selling at 73s to 79s for fine to superior bold and medium red, 67s to 72s for fair to good ditto, 50s up to 61s 6d for pickings and 53s per cwt. for blacks, being 2s to 3s down.

Import, Home Consumption, Export and Stock of Cocoa in London are as follows:—

		1899.	1898.	1897.	1896.

PEPPER.

Black.—The present week has been a very quiet one in this market, and value of Singapore on the spot in 1/16d per lb. cheaper—at 5 7/32d to 5 3/16d at which about 800 bags have been sold. For arrival the only sale reported is a little lot of 25 tons Singapore June-August shipment at 5½d per lb.

Auctions on Wednesday offered 40 bags fine shot Mangalore which sold at 8¾d; 109 bags Lampong, 100 bags Penang, and 80 bags Tellicherry, all of which passed the hammer unsold.

White is unaltered in value with business exceedingly small. On the spot small sales of fair Penang have been made at 7 13/16d For arrival a limited business has been done in Penang July-September (s.) at 8 1/16d.

At public sale on the 26th inst., 18 bags brownish Ceylon sold at 8d, while 408 bags Singapore were bought in at 8¾d, and 103 bags Penang at 8⅜d per lb.

Long.—80 bags fair grey partly sold at 38s per cwt., being dearer.

Sweet Red.—5 cases bought in at 55s per cwt.

GINGER.

Cochin—More moderate quantities were catalogued than has been the case for some time, 376 cases 503 bags being the total. Enquiry continues very poor and only 81 cases were placed—bold and medium roughly cut and scraped, limed 70s, medium and small ditto, rather wormy 37s 6d, small wormy 23s 6d, bold brown washed rough Calicut 33s to 33s 6d, mouldy ditto 30s per cwt.

African.—20 bags sold at 18s 6d per cwt for fair.

Jamaica.—The heavy quantity of 1,421 barrels catalogued proved far too much for the market, and it was necessary for holders to submit to a fall of from 4s to 7s per cwt in order to sell. Barely 600 barrels sold, the prices being 70s to 78s for fair to good bold and medium washed, 64s to 68s for leanish medium, 65s for medium hard plump washed, 60s to 63s for good ordinary dark, and 56s to 58s per cwt. for ordinary ditto.

St. Lucia—2 barrels dark brown rough realised 52s per cwt.

Green.—4 barrels brought 15s per cwt.

INDIA RUBBER.

The market continues quiet, with small sales of fine hard Para at 4s 2¾d to 4s 3d spot and forward. Negroheads, scrappy at 3s 5½d, Island at 2s 10d. Peruvian slab (scarce) at 2s 11½d, ball at 3s 4½d per lb. In to-day's auctions where importers met the market a fair part was sold at rather easy rates.

* Including payments made in anticipation of the Budget announcement.

CINCHONA.

The *Chemist and Druggist* says:—At the London auctions on Tuesday only odd lots of low-percentage bark found buyers at a decline of about 25 per cent. to 30 per cent. on last sales' rate, the unit value being 1½*d.* per lb., against 2¼*d.* at the previous sale. The nine catalogues comprised:—

	Packages offered.		Packages sold.	
South American bark (soft Colombian 1,817, Cuprea 668, yellow 191, Calisaya 61, Cartagena 38, red 90) ...	2,865,	of which	704	were sold
East Indian cinchona	779	,,	267	,,
Ceylon cinchona..	468	,,	86	,,
Java cinchona	342	,,	—	,,
African cinchona	99	,,	99	,,
	4,553		1,156	

The following are the approximate quantities purchased by the principal buyers:—

	Lbs.
American and Italian factories...	96,734
Brunswick factory	56,628
Frankfort-on-Maine and Stuttgart factories ...	11,154
Paris factory	9,088
Messrs. Howards & Sons	8,936
Mannheim and Amsterdam factories	7,640
Druggists, &c.	1,880
Total quantity sold	192,060
Bought in or withdrawn	598,140
Total quantity offered	790,200

The following prices were paid:—

African.—Fair quality chips, at 4⅞*d.* to 6⅛*d.*; broken quill and chips, 4⅞*d.* to 5¾*d.* per lb.

Ceylon.—Ledgeriana, original stem-chips, 8⅜*d.*; poor red original chips, 2¼*d.* and 3½*d.* per lb. for fair.

East Indian.—Ledgeriana, original stem-chips and shavings, 3⅛*d.* to 6*d.*; renewed, 3*d.*; Crown, original stem, 4¾*d.* to 10*d.*; renewed, 5*d.* to 7*d.*; root, 5⅛*d.*; original red stem-chips, 3*d.* to 3¾*d.*; ditto chips, 4¼*d.*; renewed, 3⅜*d.* to 5*d.*; Hybrid, original stem, 4½*d.* to 4⅜*d.*; root 4⅝*d.* per lb.

South American Bark.—The auctions included a large quantity of *Soft Colombian*, imported in 1882 to 1885. In their younger days 4*s.* to 4*s.* 9*d.* per lb. was refused for some parcels, but on Tuesday 5½*d* per lb. would have bought the best lots (said to contain 3¼ per cent. quinine sulphate), but buyers would not go above 3½*d.*, and after a few heroic attempts to sell, string after string was bought in at the limits. Bolivian cultivated *Calisaya*, flat, damaged, sold at 9*d.* to 9¾*d.* per lb., thin quill at 8*d.* per lb. *Cartagena*: 12 packages realised 1⅝*d.* per lb. for small and rather broken. *Guayaquil* red bark was all bought in at nominal prices. Some *Cuprea* bark, which long ago had eaten its head off, was sold at 1⅝*d.* to 1¾*d.* per lb. The soft Colombian and Cuprea represent, it is believed, a loss of 60,000*l.* to the sellers.

The bark sold to manufacturers on Tuesday represents 60,000 ozs. or thereby of quinine sulphate. They were low quality barks. It will be noted that the firms who generally buy most largely were on this occasion small buyers, because they declined to pay the prices asked by the sellers for the higher quality barks. The sales scarcely form a criterion for the quinine speculator, and these matters must wait next week's auctions at Amsterdam. There is total quantity of quinine sulphate in the bark to be offered equals 19,450 kilos. (680,750 oz.). The manufacturing bark contains an average yield of 5·52 per cent., against 5·26 per cent. in March, and 5·21 per cent for the ten auctions of 1898. How the sales will go is a knotty problem. The Java shipments last week were nil (so it is said). Meanwhile the arrivals in Amsterdam are large, no fewer than 1,410 packages having arrived by one vessel this week.

QUININE.

The course of this article has again been downward, and fruitless attempts were made by speculators to bolster up the market on Friday and Saturday last, but on Monday the improvement was lost, small sales being made for August delivery at 1*s* 4*d.*, and there were buyers for May delivery at 1*s.* 3½*d* per oz. On Tuesday, in consequence of the disappointing bark-sales, the market remained inactive, with sellers at 1*s* 4*d.* and buyers at 1*s.* 3*d.* for August delivery. Wednesday brought a further decline; a sale of 8,000 oz. of Zimmer's brand at 1*s.* 1½*d.* per oz. actually took place, and the two leading German brands, which have been the subject of so much speculation, dropped to 1*s.* 2½*d.* spot and 1*s.* 3*d.* August, but we heard of no sales at these figures, and by the afternoon prices had recovered by ¼*d.*, there being no eager sellers. To-day the market is again quiet.

Another report says:—

Sulphate of Quinine has fluctuated from day to day since our last. The article attracted an active speculative demand on Saturday, and, with few sellers, value of HB and B&S recovered at a bound to 1s 5d spot and May delivery, and 1s 5½d August. On Monday "all the wind was out of the sail," and value declined to 1s 3½d spot and May delivery, and to 1s 4d August. On Tuesday the market became utterly disorganized on the unsatisfactory result of the Bark auctions and without business the situation was 1s 4d sellers, 1s 3d buyers, all positions. On Wednesday matters improved, and after 1s 3d had been taken for 5,000 ozs. August delivery value recovered to 1s 3¾d. Yesterday (Thursday) a steady tone was manifest with sales at 1s 3d spot, 1s 3¼d May delivery, 1s 4d for August, and 1s 4¼d October. The sales in all do not exceed 60,000 ozs. To-day the market is firm and dearer.

Coorg.

Polli Betta, 23*rd May.*—*Weather*—Distinctly monsoonish last Saturday, 20th. It looked as if the burst was on. There was fairly heavy rain in parts. It has cleared up since, though it becomes overcast towards the middle of the day. *Crops.*—The last set is swelling; but, unfortunately, there is very little of it. *Labour.*—Plentiful All seasonable works well in hand. Borer does not appear to be very bad this season. *Health.*—Good.

FOREST CONSERVATION.

A writer in the *Queensland Agricultural Journal* comments on the ruthless destruction of valuable timber trees by "the rural public." Our readers have learnt to appreciate the value of forest trees. Many of them, indeed, have learnt by bitter experience. Denuding virgin land of its shade in bygone days they have had, in many instances, to wait long months for fresh shade to grow up to protect their crops. And if it took such men years to learn the value of shade, how easy it is to see that "the rural public" in a colony like Queensland, may require years also to assimilate the lesson that has been taught them. A story is told of a man who was recently in treaty for the purchase of a large property not 50 miles from Queensland, and one inducement held out to him was that the timber on the land was worth at least £500. "Oh! bother the timber," was his reply. "I want it cleared off to grow stuff for the stock." Just as in former days the planter in Southern India wanted to get rid of the timber, to grow coffee. Yet it is possible that a well-managed timber estate in these parts would pay better than coffee or tea. Government takes

this matter in hand on such a large scale that private enterprise is perhaps wise to leave it alone. But every planter at least should study forestry sufficiently to know which trees to retain on his estate and which to destroy. He should recognize the influence of trees on rainfall, on the soil and its fertilising properties, and on the soil as a protection against an excessive flow of water. In France, the work of restoring the forests is being systematically carried on, and in mountainous country denuded of timber, the course of torrents is stopped or deflected by means of stonework and fascines made of live willow. These fascines readily strike root, and form a barrier behind which the débris from the high lands accumulates, and so by degrees the wasting of the surface is arrested, and forest planting begins. The reafforestation of a denuded hillside, cut into deep chasms by the descending torrents, extends its influence to the plains below, often for hundreds of miles. The silt washed down from the bare hills is carried on to the lowlands, and in many cases rich alluvial plains have thus been overwhelmed with gravel, sour mud, and other silt.

In France and Germany—and we might say also in India—scientific forestry receives the attention it deserves. But in India also there is still a great deal of unscientific forestry and far more of reckless destruction of trees In many zemindaris valuable timber has been cut down so recklessly for sale that there is practically none left. The goose that laid the golden eggs has been killed. The same sort of thing has happened in many countries. The Queensland writer instances the Khanate Bucharia, which was once upon a time the most flourishing and fertile region of Central Asia. It was well timbered and well watered. What has happened to this earthly paradise has happened also in our midst. A mania for clearing seized the inhabitants within the last thirty years. All the great forests have been destroyed, and what was spared was swept out of existence by fire during the civil war. Now mark the consequence. With the disappearance of the forests, the water-courses gradually dried up; there was no water left to feed the empty irrigation canals. The great barrier against the desert sands was removed, and irresistibly they advanced upon and gained daily on the fertile plains; and it is now only a question of a short time when this magnificent region will become a desert as desolate as the solitudes that separate it from Khiva. Again, Dr. D. Morris, C.M.G., M.A., &c. &c., in his report on the "Economic Resources of the West Indies," in alluding to the forests of British Guiana, says:—The total export of timber is £16,000 per annum. The forest lands yield a yearly revenue of about £48,000, made up of "acre money," royalty on timber shingles, charcoal, balata (the milky juice of the bullet-tree (*Mimusops globosa*), a kind of guttapercha), and gums. These forests, rightly controlled, should constitute an important source of wealth to the colony. Owing to the difficulty of reaching the region above the falls the forests below have been cut over several times and the best timber removed. In some localities firewood-cutters and charcoal-burners are destroying valuable timber and preventing the growth of young saplings.

"With all the knowledge we possess on the subject of forest conservancy we still persist in the suicidal policy of extermination." The remark does not apply where Government rules the forests in India, but it unquestionably applies in many zemindaris, and we are by no means sure that there are not still many sinners against the science of forestry among the planting community. It is at least certain that India imports a great deal of timber and exports far too little, considering its resources as a tree producing country. There are many valuable timbers grown, but few are made proper use of. Where they are used at all they are probably cut down until supplies are exhausted. Natural reproduction is allowed no chance, artificial reproduction receives but little attention. In a small way planters might do much, by example and the exercise of influence, to remedy this state of affairs. They might also turn many an honest rupee by giving practical attention to forestry as a money-producing industry.

COFFEE IN DISTANT LANDS.
VI.

Paraguay.—The following small paragraph is going the round of the press:—An effort is now being made to develop Paraguay as a coffee-producing centre, it being thought that the country can be made to produce an excellent grade, in quantities sufficient to be an important factor in the South American market at least The United States Consul at Asuncion, in a recent report on the subject, says that there are now about 343,407 coffee-plants in the Republic, and all the product can be readily disposed of in the Asuncion market, because the people are great coffee-drinkers. It is believed that the Paraguayan coffee can compete in the markets of Europe.

The following information has reached us direct from Asuncion:—The cultivation of coffee is in its infancy. Several attempts have been made, and on a small scale it has given a fairly good result. The Government has recently granted half a square league of land and other facilities to an Englishman who has had experience in Costa Rica, who considers this climate and soil well adapted to its cultivation. No official reports have been published as yet on this subject.

Mauritius.—The Annual Report of the work carried on at the Station Agronomique of the Colony of Mauritius during 1897, says:—The young coffee plants raised at the "Station" last year have suffered a little from the drought and their growth was on that account retarded; besides the Liberian coffee trees, especially those reared at Pamplemousses were severely attacked by the common scarabee (*Crotopus punctum*). This insect is not perhaps so abundant in every district of the Island, but at Reduit and in the Pamplemousses gardens its attacks are very injurious to young plants whose leaves it eats off as fast as they grow; several plants completely lost their leaves and some had to be replaced.

This pest does not up to now attack the local variety but the Liberian coffee only and may become a serious drawback to the raising of new plantations. Some can be destroyed at night by means of insect traps furnished with a lamp and reflector, but, as a rule, they are not attracted by light and the best measure to adopt for their destruction is to send round "chocras" early in the morning to pick them while they are still benumbed by the coolness of night, as in the daytime they fly away as soon as you approach to capture them These coleopters assemble on

certain plants in preference to others, and if they are not destroyed within a few days all the leaves will fall off or will be left only with the mid rib. Under such conditions if the plant does not die off, vegetation remains inactive and the result is a delay in growth, of one year at least.

On large plantations another measure would be the keeping of flocks of turkeys or even hens to prey upon these insects which could be made to drop upon the ground by shaking them off the trees early in the morning; those are the only birds here likely to feed on these insects. For one or two years some small plantations of Liberian coffee have been started in several parts of the Colony, but from information received they do not seem to have been attended with the same success everywhere, and if some made a good healthy growth others did not turn out successfully. Such variable results, although it may be too early to decide, show how advantageous it would be to make trials in as many places as possible in order that the nature of the soil or climate where this culture would be profitable might be determined.

The coffee plants at Reduit were attacked besides by several coccids These insects when in great numbers prove detrimental to the growth of the plant; they infest the young green twigs and the inner surface of the newly formed leaves which are not yet fully developed; the leaves then become covered over on the upper surface with a black-felted coating having the appearance of soot which is caused by the mycelium of a fungus.

This fumagine is merely the consequence of the presence of Kermes which exude on the leaves a sweetish substance which furnishes excellent nutriment for the growth of the fungus. It is not, therefore, properly speaking a parasitic fungus, but the honey-dew which it exudes on the leaves coupled with the attacks of slugs causes a diminution of growth in the young plants; their leaves curl up and are no longer capable of discharging their respiratory functions in a normal way. These insects which were identified by Mr. D'Emmerez are the *Lecanium inide* (*viride ?*), which is the most widespread and the *Lecanium coffee* more rare up to the present time; they are found especially on the Liberian coffee, but occasionally also on the common variety.

These parasites unfortunately are not easily reached by the different insecticides which can be applied, as they are protected during all their stages by hard and impervious scales beneath which they are in safety. Certain mucious remedies applied on a small scale become too expensive and are scarcely practical on large plantations; the more so because strong insecticides cannot be applied owing to the continuity of growth in the trees as they would prove detrimental to the slender organs of the plant and be more injurious than the pest itself. Berries were again attacked this year by the larva of the fly described last year: the *Thiptocera octoguttalis* (determination of Mr. Alluad, Vice-President of the Entomological Society, Paris) and a large number were destroyed before attaining maturity. This fly is not very abundant but is very destructive; the larva is seldom found in the berries infested as it moves quickly and travels from one seed to another after damaging the peduncle of the fruit which blackens and dries up; by picking off and destroying all the berries which begin to turn yellow and which may contain the larva, their multiplication might perhaps be checked.

These are not the only insects injurious to coffee. Small branches or twigs are sometimes observed whose leaves turn black and dry up without apparent reason; if the twigs thus attacked are examined, a small hole of ½ a millimeter in diameter is found at the place where the infection began, in the middle of and underneath the twig; this opening penetrates as far as the centre and then follows the medullary canal upon a length of 2 centimetres; in the tube thus formed larvæ and complete insects measuring 1½ mm. and varying in colour from brown to black are found. These coleopters which are probably scolyptes, according to Mr. D'Emmerez, cause the death of the twigs so infested which must then be cut off below the point of penetration and burnt immediately.

The *Hemileia Vastatrix* was also more abundant than last year although sprayings with *bouillie bordelaise* were applied in the same manner and as frequently as before. The ravages have been especially severe on the young plants still striking roots; adult trees also lost many leaves, but this did not prevent the berries attaining maturity. The Leroy variety, judging at least by the few plants existing at Reduit, appears less liable to *Hemileia* and seems to stand the disease better.

This pest also attacked a few Liberian plants, but the greater number were completely exempt. When these different varieties come to flower at the same time, we shall endeavour to obtain a cross variety which would possess the qualities of the Arabian coffee and resist the attacks of *Hemileia* as the Liberian.

THE ENGLISH IMPORT DUTY ON TEA.

The attempt to bring about a reduction of the British Tea duty has been made and has failed. The result of the attempt affords us pleasure, for we cannot but feel that a 6d. duty would be more favourable to Indian and Ceylon teas than a 4d., and therefore a 4d. is more favourable than a 2d. impost. We have been surprised, however, at a letter addressed by the Indian Tea Association to the Planters' Association of Ceylon, with reference to the resolution of the Committee of the latter that they are not yet sufficiently convinced of the desirability of the reduction of the tea duty in England to induce them to take up an agitation on the matter at present. The General Committee of the Indian Association are, on the contrary, strongly in favor of a considerable reduction in the English Import duty, and the Secretary writes:—"They have consequently read the resolution I have quoted with considerable regret. In their opinion the abolition of the duty would lead to a considerable increase in the consumption of tea in the United Kingdom, as was evidenced by the increase in consumption of 7 per cent. which followed the reduction of 2d. per lb. in 1890. They have in fact no doubt that the removal of the tax would lead to a greater demand for cheap tea than at present exists among the artisan and labouring classes in England. The General Committee are further of opinion that the abolition of the duty would probably tend not only to the removal of the abuses now existing in the London warehouses in connection with the opening and weighment of tea, but also to the reduction of the present heavy charges with which tea is mulcted there, which constitute a matter of importance to the welfare of the industry. Holding these views, the

General Committee have found some difficulty in determining the reasons which have led your Committee to pass the resolution referred to, and I have been instructed to ask if you would be good enough to favor them with a statement of such reasons in order to enable them more completely to understand the attitude taken up in Ceylon." To say the least of it, this inquiry seems disingenuous. We presume the members of the General Committee of the I. T A. read the newspapers occasionally. In various newspapers that must have come under their notice opinions of London brokers and others, for and against a reduction of the British Tea duty. have been expressed at length. Ceylon planters have also written to the press on the same subject. Under these circumstances, the I T A. should have no occasion to ask the C. P. A. for a statement of its reasons for hesitating to declare itself on one side or the other For our own part, we think no stronger reason need be cited than that, the higher the duty the greater the disadvantage at which it places the low class imports from China in competition with the better sorts imported for Ceylon and India. Were the duty abolished altogether, one result would probably be a revival of the China tea trade with the United Kingdom—a revival that all Indian and Ceylon tea-planters should guard against by any means in their power.

THE OVER-PRODUCTION OF BRAZILIAN COFFEE.

Many writers have commented on the over production of Brazilian coffee, and the consequent fall in values. Still, the following table showing the production of coffee in Brazil and in the world since 1874, and the average price taken at Havre, may be interesting:

PRODUCTION OF COFFEE.

Crop.	Bags of 60 Kilos.			Price of "Good Average" per 50 Kilos.
	Brazil.	Other Countries.	Total.	
				Francs.
1874-75	3,843,600	4,295,400	8,139,000	103
1875-76	3,505,800	3,679,200	7,185,000	106
1876-77	3.294,000	4,520,000	7,814,000	101
1877-78	3.498 200	4,017.800	7,516,000	96
1878-79	4,718.000	4,200,000	8 918,000	76
1879-80	3,172.000	5,413,000	8,585,000	84
1880-81	5,553,000	4.205,000	9,758,000	75
1881-82	5,562.000	4,829.000	10,391,000	57
1882-83	6,711,000	5,369,600	11,080,000	50
1883-84	5,056,000	4,711,000	9,767,000	62
1884-85	6.211 000	5.229.000	11,440,000	52
1885-86	5,532.000	3,956,000	9.488.000	48
1886-87	6,129,000	4,183,000	10,312,000	81
1887-88	3,006.000	4.071,000	7.077,000	94
1888-89	6,735.000	3,863,200	10,598,300	97
1889-90	4,220,000	4,438,200	8,658,200	103
1890-91	5,308,000	3,989,000	9,297,000	109
1891-92	7.376.000	4,482,000	11,858,000	91
1892-93	6,193,000	5.090,000	11,283,000	97
1893-94	4.307,000	4,895,000	9,202,000	103
1894-95	6,689.000	4.947,000	11.636.000	94
1895-96	6,250,000	3,944,000	10.194,000	90
1896-97	8,680,000	3,928,000	12.608 000	61
1897-98	11,110,000	4,600.000	15,710,000	39

The average price in April, 1898, was 35 fr. 50 c.; in May, 36 fr. 25 c.; in June, 36 fr.

As regards the 1899 crops estimates are, as usual, very varied and conflicting. A correspondent in Taubaté, in the Northern district of S. Paulo, writes as follows: "Coffee is expected to flower generally in this district in September and October, but sometimes it is prolonged, as last year, as late as December. Some plantations had flowers on them last month, March, but that is an exception. It seems to be the opinion of planters in this district that the coming coffee crop, 1899-1900, will prove very much smaller even than the current one. Picking in this district commences usually in April and continues until November." A crop of at least 10,000,000 bags for Rio and Santos was looked on as a certainty; now reports from many districts seem to point to a partial failure. From Rio especially reports are discouraging, the belief that the crop will not exceed the current one being pretty general. In the north of S. Paulo, as this correspondent's letter shows, the probabilities are regarded as similar. Vice-Consul Hauguitz also puts the estimate lower, and he is regarded as a man who has had, as American Vice-Consul at Santos, specially favorable opportunities for studying the subject The information recorded on another page under the title "The World's Coffe Trade" is worth noting.

We may here appropriately quote the following remarks of the *Brazilian Review*:—"It is much to be regretted that no effort has yet been made to organise a regular and systematic estimate of crops, such as are usual for wheat in other countries. Until it be undertaken, estimates, however conscientious, will be liable to errors, which in Europe are interpreted as deliberate intentions to deceive. We believe there is no such intention, although here as everywhere the wish may be often parent, to a large degree, to the thought. Over so vast an area with the conditions varying so immensely, any accurate estimate is impossible with the insufficient elements at present available."

TEA IN THE UNITED STATES AND CANADA.

In the course of some very interesting remarks on "The Future Outlook on Tea," the *Canadian Grocer* comments on the speculation that is rife as to the effect on the tea markets of the new United States standards which were to come in force on the 1st instant. The new standards, according to leading authorities in the trade, will admit a grade of tea into the United States that was barred out by the old standards. For this reason holders of teas running from 15c. down have expectations that there will be a demand for stock of this description now held in first hands in Canada. The Canadian reserve is said to consist chiefly of teas from 16c. to 13c. and to be comparatively limited, so that a special demand from the States would certainly cause prices to advance. Accordingly many holders have manifested a desire to wait until the exact effect of the change in American standards can be gauged before urging business. The tone, therefore is quite firm in Montreal. Pingsueys are scarce. Recent shipments to New York from Montreal have comprised some 2,000 odd packages of Congous About 1,000 packages of Gunpowders have been taken for the same market, and, finally, Ceylon reports of late have been bullish. The *Grocer* concludes by remarking:—"With a shortage in China and India, this reduction in the

Ceylon possible supply becomes a serious consideration, and is expected to have an important bearing on prices. Possibly this condition has something to do with the inquiry experienced in Montreal and New York lately from London for Ceylon teas."

Since writing the above, we have read the following in the *Ceylon Observer*:—"From a leading wholesale merchant in Montreal we have received a communication in which he says:—'Ceylon Tea is selling well here and becoming more popular every day: prices are also up several cents lately: incidentally I may say I have had a good season and feel bright.'"

NOTES.

Brazilian Coffee. One exporter in Brazil recently bought from 50,000 to 60,000 bags in 8 or 10 days. No wonder the market kept steady!

Mr. Pineo's Opinion. Elsewhere we give some interesting remarks of Mr. R. E. Pineo on the manner of conducting the Tea Campaign in the United States. "Doctors disagree" considerably in regard to this subject, but Mr. Pineo's suggestions are at least practical.

Advertising Teas by Photographs. The Thirty Committee (Ceylon) lately resolved that the permission of Government be asked to place selected photographs depicting the Ceylon Tea industry inside the first-class carriages on the Ceylon Government Railway.

Coffee in Queensland. Apparently the question of an increase of the duty on Coffee in Queensland has been mooted. This does not point to any great belief on the part of Queensland coffee-planters in their power to hold the local market "against the world."

The London Tea Market. Cabling to Colombo on the 18th instant, Messrs. Gow, Wilson and Stanton reported that the market generally was weak, but fair liquoring teas were steady. The average was 8*d*.—a fall of 9¼*d*. According to Reuter, 27,000 packages Ceylons were sold out of 30,000 offered, and 8,000 Indians out of 9,000 offered. The average of Indian Teas was 8¼*d*.—a fall of 9¾*d*.!

Colombo Tea Sales. On 17th instant about 13,366 pkgs. = 1,078,325 lbs. were offered, of which about 9,504 pkgs. = 769,431 lbs. were sold. The quality of tea offering showed a great falling off, and broken pekoes were very irregular in price, and in many instances showed a decline. There was not much change in teas for prices. Among the best teas in the sale were, says the *Times of Ceylon*, Mt. Everest, Monkswood and Middleton.

"The Agricultural Ledger." The first three numbers for 1899 are just out and are as follows:—I. *Cyanotis axillaris* (spider-wort), richka weed as a famine food in the Bombay Presidency, by Prof. A. H. Church, M. A., F. R. S.; II. *Calotropis gigantea* (swallow-wort)—Madar Bark Fibre, by Prof. Wyndham R. Dunstan; III. *Villebrunea integrifolia* (Ban riha), Bon or Ban Riha: Wild Rhea, by Prof. Wyndham R. Dunstan

Ceylon Tea Commissioner for Europe. The *Times of Ceylon* appears to think that Mr. J. H. Renton, of Messrs. Bosanquet & Co., Colombo, will accept the offer of the Thirty Committee, to follow up his appointment as one of the Commissioners at the Paris Exhibition by becoming the Committee's permanent representative for the whole of the Continent. The proposed remuneration is £1,000 a year—to cover all expenses, including travelling, which item alone will consume a quarter of the sum.

Natives as Tea Drinkers. In a "note on the effect of the increasing imports of foreign sugar on the market for, and price of, Indian sugar" (in the Bombay Presidency), Mr. Morison states:—"Large classes of people, such as ordinary mill-hands and other operatives in Bombay, who, a few years ago, seldom indulged in sugar, except as a luxury on rare occasions, now use it in tea and coffee daily, and doubtless the same is the case in towns up-country." So the development of a taste for tea has at least made a start in India.

New Blood. Some time ago, referring to Mr. John Cameron's recommendations, we urged planters to develop a system of exchange of seeds, &c. The following from the *Gardeners' Chronicle* has a direct bearing upon our suggestion:—Gardeners might take a hint from the market-growers who occasionally infuse new blood into their stock by purchasing from their neighbours; and also, say, every second or third year, introduce a lesser or greater number of plants from a source reputedly healthy, and, as far as possible, propagate only from these.

Coffee and Cocoa in San Domingo. The mountain regions of San Domingo, says Robert S. Hill, in "Cuba and Porto Rico," like those of Haiti, Cuba, and Jamaica, are especially suited to the culture of coffee. The annual yield is about a million and a half pounds. The area of uncultivated lands suitable for coffee in this island probably exceeds that of all of the rest of the Antilles. Cocoa is extensively cultivated, much foreign capital having been invested in it within recent years, and the production having multiplied fivefold within the past decade.

No Indian Coolies for Ceylon. The *Times of Ceylon* remarked on 17th instant:—The arrival of the B. I. steamer *Aska* from Tuticorin this morning is noteworthy in that she did not bring a single estate cooly from South India. The Immigrant Officer, Mr. Anderson, thinks it very unusual, such an occurrence not having been heard of before. The B. I. boats, which arrive every day from South India, have never failed to bring a certain number of estate labourers; but the cause of none arriving by the *Aska* is at present not to be ascertained.

Imports of Tea into the United States.

The imports of tea for the first eight months of the present fiscal year, ending February, were as follows :—

From—	1898. Lbs.	1899. Lbs.
China	32,145,071	26,647,600
Japan	19.731,223	27,469,665
United Kingdom	1,491,014	943,533
East Indies	1,469,126	1,069,657
British North America	439 125	596,152
Other Asia and Oceanica	257 778	1,187,253
Other countries...	1,911	9,392
Total...	55,535,248	57,923,252

The Break of the Monsoon in Ceylon.

The *Times of Ceylon* of 17th inst. says :—The expected burst of the south-west monsoon took place to-day, according to Captain Donnan, the Master-Attendant. It was ushered in by a heavy rain squall, with thunder and lightning, about 4 o'clock this morning, while the waves are now beating over the breakwater. The weather to-day is decidedly monsoonish—that usually in evidence when the south-west sets in prevailing. The burst of the monsoon last year occurred on the 25th of May. It is very early this year. There has been very little rain at most of the outstations, though Nuwara Eliya yesterday registered 2·52 inches. The wind is marked as S.-W. at most of them ; but at Badulla it is N.-E., at Batticaloa S.-E., and at Hambantota N.-E.

Tea in New York.

The *American Grocer of* 19th ultimo says :—The sale by the Montgomery Auction and Commission Company, on Wednesday last, of 24,913 packages of tea, was a very severe test of the market. Taken as a whole, the result indicates a very strong market. The prices obtained were better than were estimated. The Pingsueys brought full prices. The Formosas were irregular, the better grades selling off, while the lower qualities were well supported ; the lowest price was 13 cents ; good, 13 to 13½ cents ; superior, 15 cents ; fine, 20 cents ; finest, 24 cents. Moyune Greens were firm and the average of the lot good, notwithstanding extra Gunpowders and extra Young Hysons, sold off. The offerings of Japans, Congous, Indias, and Amoys were light. Further details will be found in the regular report of the tea market.

Metals and Tea.

Mr. Boyd, a "Gold expert" in Ceylon, lately said that what helped the growth of tea was the metallic constituents in the ground, and in other tea countries such as China and Japan they found iron. Ferric oxide was a very important factor in the growth of tea. "You have it there," said Mr. Boyd, pointing to the red road outside the hotel "and it is in the tea districts in larger quantities." In Ceylon they had limonite (iron) which ran up to 52 to 60 per cent. of metallic iron and he had found 71·62 per cent. of oxide of iron deposited in the ground. Mr. Boyd reported satisfactorily of the plumbago in the Matara district. That place was on the centre of the mineral belt of Ceylon, a great belt which ran north 20 degrees east. He says there is gold in Ceylon, so "golden tips" may yet become more plentiful.

Coffee in Brazil.

We give elsewhere a report by Mr. Julian Hauguitz, for many years American Vice-Consul at Santos. Mr Hauguitz is of opinion that the height of the coffee production of Brazil has not been reached. There is near Preto a plantation with 6,000,000 trees, and there are at least twelve other plantations with 1,000,000 trees each. The amount of land adaptable to coffee growing is several times larger than the present area under cultivation. In the older territory which extends from the 20th to a little below the 23rd degree of latitude, and for which Rio de Janeiro is the port of export, the plantations are declining, but there is a large area now at its full productive capacity adjoining which, and also in other scattered sections, is a new district where the coffee trees have not yet come into bearing. Mr. Hauguitz thinks it probable that it will be several years before the full productive limit is reached.

Canada's Imports from U. K. and U. S.

The following figures show Canada's imports of coffee and tea from the United Kingdom and the United States during the years 1897 and 1898 :—

	1898.		1897.	
Coffee, green	202	30,098	328	20,88
Coffee, extract or substitutes ...	1,375	3,130	1,378	1,62
Coffee, roasted or ground, when not imported direct from country of production ...	444	42,025	413	39,4
Coffee, roasted or ground, and imitations, and substitutes for	114	4.419	67	2.6
Coffee, condensed, with milk ...	226	227	178	
Tea	2.576	63,308	2,129	20,07
FREE IMPORTS.				
Coffee, green, imported direct...	82,556	...	136,499	...
Tea, imported direct or purchased in bond in the U. K...	665,649	...	1,047,761	...
Total free goods...	$1,001,456	$54,568	$1,475,816	$76,22

China Tea in the United States.

Messrs. A. Campbell & Co., state in their Tea Report, dated Shanghai May 1st :—*Green Teas*—The imposition of *ten cents* per lb. duty on tea, which took place in the United States on the 14th June last year, acted as a drag on the new season's business owing to the large supplies which had been accumulating in America for a series of years, teas of such inferior quality as to be quite unsaleable till brought to light by the new tariff. When these surplus stocks were disposed of a general improvement set in, and led to an active demand here late in the season, when prices recovered materially from the lowest point. Export figures, in pounds, for the past four seasons are as follows :—

	1898-99	1897-98	1896-97	1895-96
United States and Canada.	13,436.000	15,634,000	16,157,000	21,560,00
United Kingdom ...	4,205,000	4,929,000	5,783,000	6,721,00
Continent of Europe ...	499,000	593,000	256,000	82,00
Batoum (mainly) Hyson...	5,234,000	3,750,000	807,000	196,00
Bombay (mainly) Hyson	1,203,000	922,000	5,272,000	4,453,00
Totals...	24,577,000	25,828,000	28.275,000	33.012,00

The American Tea Trade.

Mr. Wm. Mackenzie, the Ceylon Commissioner in the United States writes that he has now heard from the Indian Committee that they are *willing to pay their share* of the advertising in the States till the end of the year (August and September excepted, as we ease off during those hot months) provided he carried it on jointly as hitherto. Mr. Mackenzie says :—"I have told them I would do so till the end o

lay, but after that it would depend upon whether the Ceylon Committee approved or otherwise. What do you ay? I might give reasons for and against. Perhaps on he whole we should accept their offer. Ceylon or Indian eas are imported indifferently by the large houses according o which is the cheaper at the moment, and that Ceylon generally is. To the consumers, the teas go as Ceylons—ndians being seldom advertised by the trade." *We* should ay that this last remark clearly shows that India ought *ot* to work through the Ceylon Commissioner. Indian teas hould make a name for themselves, not go into consumption as "Ceylons." Mr. Mackenzie's remarks lend force to vhat we recently wrote about the withdrawal of Mr. Blechynden.

The Klanang Produce Co., Ld.

The prospectus (lately issued in London) of this Company puts the share capital at £20,000, divided into 0,000 one-pound shares. The present issue is £13,500, of vhich 7,500 fully paid-up shares will be issued to the endor in satisfaction of the purchase price, and 7,800 hares at par are now offered for subscription payable 2/6 n application, 2/6 on allotment and the balance as required. Mr. F. H. Wiggin, of Ceylon and Woolstone, Cheltenham, s Chairman and Messrs. Ed. Walker, Jas. M. Caine and David K. Michie, of Ceylon, are directors. The Company s formed to take over, carry on and develop the Klanang nd Beaumont estates in the Federated Malay States of elangor. Klanang is planted with 206 acres of cocoanuts nd Liberian coffee, five acres of cacao, 14 months old; our of cocoanuts alone, half being in bearing; and 4½ acres re to be planted with tea, for tea seed; while from 1,705 o 1,924½ acres remain at present, jungle reserve. On Beaumont there are 90 acres of Liberian coffee, two years ld; 148 cleared and drained, but not yet planted, and 156½ o 394½ still in jungle. Cocoanuts grow well and are extremely productive in the Klanang district, and it is intended to pay special attention to that product, but coffee, ubber, ramie, etc., will all probably be included in the ultivation and development of the Company's estates. The wo estates have been valued by Mr. E. V. Carey, who put he Klanang estate at 47,645 dollars, and the Beaumont roperty at 11,008·50 dollars.

The proposed Canadian Tea Duty.

Mr. Nosse, Consul-General for Japan at Chicago, was in Canada ately and stated:—I have every reason to believe that the gitation in favour of a duty on tea is fostered by firms andling Indian and Ceylon teas, as, with a duty placed pon tea, they would get the British and Colonial preference of 25 per cent. They are shrewed enough to see this, nd it looks very much as if the inspiration of these gentlemen has led to the newspapers taking hold of the matter. n referring to the subject, the alleged excuse is put forth hat the teas of China and Japan are impure. So far as he China teas are concerned, I have nothing to say; the Chinese can attend to their own affairs, but, as regards apan tea, I give a most emphatic denial to any report hat impure teas leave Japan. The Government of Japan as, after consultation with the great tea associations of ty country, instituted a system of inspection before any ea is allowed to be exported. So that if any person ttempts to adulterate the product he is immediately caught. This policy was adopted for the purpose of maintaining the high reputation of Japan tea and it has been most successful. "I think, however, that this fact is not generally known, and it may, therefore, interest your readers. I may mention that last year in the city of Chicago, which is a large importer of Japan teas, not one single chest of tea was condemned as being impure, thus bearing out what I have just said. Reverting for a moment to the suggestion of a duty upon tea by Canada, let me call your attention to this peculiar fact, I understand the principle of taxation in any country is to apply it equitably; it is hardly possible to do this in Canada as regards tea. The Provinces of Ontario and Quebec are large consumers of Japan tea. Indeed, these two Provinces take 90 per cent. of the total amount imported into Canada. If, therefore, your Government should unfortunately decide to impose a duty upon tea, it will have the effect of making these two Provinces pay 25 per cent. more than the other Provinces, which consume black tea chiefly coming from India and Ceylon. That is a point which is well worthy of consideration by your Parliament."

GENERAL ARTICLES.

EXPORTS OF TEA AND COFFEE.

In the course of an article on the Export Trade of India the *Times of India* remarks:—

Our export trade in tea forms another interesting field for enquiry. It has increased during the three years under consideration from an annual total of 148 million pounds to 157 million pounds. The consumption of Indian tea in the United Kingdom continues to expand. Moreover, our tea is finding its way in larger quantities into other countries. The United States is showing a greater appreciation of its good qualities; Persia, as has recently been pointed out by the British Consul-General at Meshed, is rapidly increasing its orders; while the quantity sent to Turkey-in-Asia shows a gratifying enhancement. The growth of the tea export trade is best illustrated by the following table:—

	1896-97.	1897-98.	1898-99.
	Lbs.	Lbs.	Lbs.
To United Kingdom ...	135,456,884	137,655,857	139,245,995
„ Russia	457,634	689,271	500,899
„ United States	784,962	929,704	1,413,624
„ Persia	1,993,823	1,464,394	3,456,791
„ Turkey in Asia ...	1,981,197	1,336,970	2,598,281
„ Australia	6,155,895	6,792,654	6,306,135
„ Other Countries ...	2,078,066	2,582,967	3,948,957
Total...	148,908,461	151,451,817	157,470,672

But there is another side to the shield. While our exports of tea have been growing in bulk, they have been diminishing in value. The market price of tea has fallen. Therefore it is that while our tea exports were valued at 812 lakhs in 1896-97, their estimated value was placed at only 804 lakhs last year. Another branch of the tea trade seems to be in need of greater elucidation—that dealt with in the returns of re-exports of foreign merchandise. We received last year 3½ million pounds of tea from other countries, principally from Ceylon and China. Of this quantity 2⅓ million pounds was re-exported, almost entirely to Persia. Presumably the bulk of these re-exports found their way into Russia. But the re-export trade in tea is in a very different position from that which it occupied in 1896-97, when we received for re-exportation over 6 million pounds from China alone. Our coffee trade continues to flourish. Exports of coffee have risen from 210,000 cwt. in 1896-97 to 270,000 cwt. last year. Great Britain is far and away our best customer for coffee, though France took 42 lakhs worth from us last year. The trade is entirely in the hands of Madras

TEA, &c., COMPANIES.

Baradighi Tea Co., Ld.—Deficit Rs 31,010-11-7. Favorable weather was experienced in 1898 and the garden made 626 maunds of tea as against an estimate of 600 maunds. The average price realised was 0-5-8 per lb., which compares favourably with that of the majority of gardens in the district.

Scottish Ceylon Tea Co., Ld.—Net profits £4,234-11-8. Interim dividend 3½% paid in September Final dividend 6½%. making 10% per year. The average prices realized in the London and Colombo markets respectively were 7·869d and 32 cents. against 7·956d and 35½ cents for the previous year.

The total crops secured from the company's properties amounted to 758,999lbs.

Kallinugger and Khoreel Tea Co., Ld.—Loss Rs. 4,894-8-11, crop 263,465 lbs., average price As. 4-9.

The Carron Tea Co., Ld — Profit Rs. 40,603-12-8. The season was on the whole favourable and a crop of 4,275 maunds tea was obtained, being 725 maunds in excess of the estimate and 800 maunds more than the outturn of the previous year. The average price realised was 8¼d per lb. (6 annas 9 pies) against 8d per lb. (6 annas 11 pies) in 1897.

The Kousanie Tea Co., (Kumaon) Profit Rs. 5,973-11-9, outturn 72,321 lbs., average price As. 9 8p.

Ceylon Proprietary Tea Estates Co., Ld.—Balance of profit and loss £5,244-10-4; interim dividend of 2% paid 31st October 1898; final dividend 2% making 4% for the year.

Rangalla Tea Co. of Ceylon, Ld.—Profit £518-1-3. The tea crop amounted to 206,620 lbs. and the cardamoms to 4,026 lbs., as against the original estimates of 240,000 lbs. and 5,000 lbs. respectively.

The sales of tea show a net average price per lb. of 6 31 pence, being equal to, say, 39 cents per lb. Exchange for the Company's drafts during the year has averaged 1s 4 7-16d as against the exchange for 1897 of 1s 3 35-64d.

Ragalla Tea Estates, Ld.— Profit £2,153-19-8. The report shows that the estates have been maintained in the highest state of cultivation, and that the future prospects of the Company are most favourable. During the year the crops realized in London were:— Tea, 367,715 lbs, at a gross average of 9·96d per lb. Coffee, 95 cwt. 2 qrs. 23 lbs., at a gross average of 91s 8d per cwt.

THEY DON'T LIKE TEA.

FRENCH GIRLS IN LONDON WHO DECLINE TO JOIN THE FIVE O'CLOCK TABLE.

Britain's greatness has received a bad check. The Empire's progress depends upon its capacity of absorption. Not the sort of absorption, let it be said at once, that will suggest itself to certain ill-fashioned minds and acquired tastes, but that other absorption —the swallowing up of native races which generally ends in the territories that once belonged to them becoming British.

The map of the world shows that we have gulped a good deal. But we have met more than our match in the Parisian modistes brought across from France by Messrs. Paquin & Company. They won't be absorbed, and they won't absorb our tea. They don't mind trying to learn English, they pretend to enjoy our fogs, they let the workrooms resound with their pretty prattle, but they won't renounce their nationality to the point of taking afternoon tea!

With all our proselytising agencies this is a sad set-back.

DEJEUNER AND EIGHT O'CLOCK DINNER.

Paquin & Company, respectful of the young ladies' Gaelic susceptibilities, gave them midday déjeuner as in Paris, and eight o'clock dinner as in high life on this side. They excused their attendance at the five o'clock tea served to the English girls in their employment and to the score or so of French girls who have abjured their nationality to the point of absorbing tea in the middle of the afternoon.

The girls who were permitted to stay away from the tea room they did not appreciate were found in a workroom by a Factory Acts inspector, and magisterial proceedings resulted in a fine being imposed on the firm for not giving them half an hour's rest between lunch and dinner.

Eight young ladies were in court anxious to tell the magistrate that they didn't like tea, and preferred remaining in the workroom to watching the English girls (and their weak fellow-count women) drink tea as if they liked it. Seventy-two or 73 delici Parisiennes (that is about the number of tea haters out of the French girls employed) were even more anxious to tell the *Le* representative the same story yesterday afternoon. But when got to the threshold of the workrooms and gazed over the hea the girls away out of the windows into the grounds of Devonsh House his heart failed him, and he took it for read that these li modistes didn't like tea.

GREAT NATION BEATEN.

Still, it is a sad confession to make on the part of an absorb nation, that these French girls cannot be brought into line absorb our tea Paquin & Company say they will have to dev some means of getting them out of their work-rooms for half hour every afternoon, but apparently they don't feel called upon order them to the tea-room and pinch their noses till they swall the tea just in the same way that babies' noses are held till t teething powders are comfortably out of sight.

To think that while we are raking in territory by the contine and natives by the tribe this bevy of pretty French girls lives the heart of London so utterly un-English as not to like tea *Morning Leader*, April 15.

TEA.

CEYLON TEAS IN AUSTRALIA AND NEW ZEALAND.

The *Times of Ceylon* says:—Mr. G. Grahame Cripps, representi the well-known Dunedin firm of Messrs. Wm. Scoular & Co., is present spending a holiday in Ceylon and has something intere ing to say with regard to the progress of Ceylon teas in Austra and New Zealand. For many years Mr. Cripps has been associat with the tea trade in Australia and New Zealand, and latterly has acted as tea buyer in Dunedin to the above-mentioned fir Owing to the limited time at his disposal. Mr. Cripps is unable carry out his original intention of proceeding to Calcutta.

BADLY MATCHED TEA FROM COLOMBO.

In the course of a chat with a representative of the *Times Ceylon*, Mr. Cripps was asked if he could give any reason for t falling off in the exports of tea direct from Colombo to N Zealand, the figures for 1897 being 2,228,137 lbs, as again 2,133,584 lbs. in 1898.

"A large amount of tea," said Mr. Cripps, "is at present pu chased in the Melbourne and Sydney markets, and shipped dire to New Zealand; the advantage to the buyer being that he can s beforehand what he is going to buy and avoids running the risk receiving badly matched tea from the Colombo dealer, who is son times more anxious to carry out an order than to properly mat the tea"

"But are not the prices in Melbourne and Sydney a little dearer

"That depends on the market. Of course, when the market weak, we take advantage of it."

"With regard to China teas, they are clean out of our marke or next door to it. Whilst formerly we used to bring down fi shipments of Chinas, now fifty half chests last us two years."

KEEPING QUALITIES OF CEYLON AND INDIAN TEAS.

Mr. Cripps pointed out that it was extremely unfortunate th Ceylon teas keep so badly as compared with Indian

"We are anxious to push Ceylon teas; he remarked, "but ou experience is that Indian teas keep so very much better We mig have stuff in our stores for some time, and then we send it out to t country storekeeper, who keeps it in his stores for another two three months, with the result that the tea is flat before it reach the consumer. We have to correct this by using much mo Indian teas than we should otherwise. It is generally fou however, that the consumer prefers Ceylon to Indian teas. S you will see that the dealer runs a considerable amount of ris in stocking Ceylon teas very largely, owing to the fact that the go off, whereas Indians do not, and thus the business is far mo hand to mouth in character than it would be.

RETAIL PRICES.

"How do the retail prices of Australia and New Zealand co pare?"

"The retail prices in New Zealand are much better than those Australia. If the latter it is 1s., 1s. 3d., and occasionally 1s. 6 but with us the prices are 1s. 9d, 2s., and 2s. 4d., though the bu is sold at 2s., the duty being 4d."

CONSUMPTION OF CEYLON TEA LIKELY TO INCREASE.

"Do you think the consumption of Ceylon tea is likely to increase?"

"Yes, I believe the consumption of Ceylon tea will increase. There is not a big population to work upon, but the consumption is something over 5 lbs., per head."

"Are New Zealanders as big tea drinkers as the Australians?"

"Not quite. You see Australia has a hotter climate, and they drink much more tea there."

"What do you think, roughly, is the relative difference in consumption between Ceylon and Indian teas?"

"The proportion, I think, is Ceylon 3 lbs. and Indian 2 lbs."

"What kind of tea is in most demand?"

"I think the people prefer a full-flavoured and heavy tea, especially in the South."

A HINT.

In concluding the interview, Mr Cripps expressed the opinion that Colombo tea firms were a bit behind in regard to the attractiveness of the labels placed upon the tea packages sent down to Australia and New Zealand. Very often, he said, smartly packed tea with attractive labels, something indicative of the place from whence it comes, induces the public to purchase.

Mr. Cripps has taken a trip to Kandy and Nuwara Eliya, and is delighted with the lovely scenery of the hill country.

AMAZING LIFTING POWER OF PLANTS.

Experiments have demonstrated that one of the most amazing things in nature is the lifting power possessed by a growing plant. Science has proved that such an insignificant, commonplace vegetable as a squash is capable of elevating a 5,000-pound weight by the mere force of its resistless living power of expansion. Given the requisite number of these products of nature and the squash could elevate a modern sky-scraper or rend a rock.

Experiments to show the marvellous force latent in the vegetable world have been conducted by Charles H. Ames at the Massachusetts Agricultural College, Amherst. The attention of the president of the College, W. S. Clark, was directed to the matter, and he, together with other gentlemen interested in opening up new pathways to knowledge, made further experiments. A squash was procured and a harness constructed on such principles as would enable the plant to exert to the utmost its lifting powers. In describing the preliminary experiments and the theories on which they based their plans, Mr. Clark says:

"The following considerations suggested the idea:

"*First.*—It is a well-known fact that beans, acorns and other seeds often lift comparatively heavy masses of earth in forcing their way up to the light in the process of germination.

"*Second.*—We have all heard how common mushrooms have displaced flagging stones many years since in Basingstoke, and more recently in Worcester, England. In the latter case, only a few weeks ago, a gentleman, noticing that a stone in a walk near his residence had been disturbed, went for the police, under the impression that burglars were preparing some plot against him. Upon turning up the stone, which weighed eighty pounds, the rogues were discovered in the shape of three giant mushrooms.

"*Third.*—Bricks and stones are often displaced by the growth of the roots of shade trees in streets. Cellar and other walls are also frequently injured in a similar way.

"*Fourth.*—There is a common belief that the growing roots of trees frequently rend asunder rocks, on which they stand, by penetrating and expanding within their crevices.

"Having never heard of any attempt to measure the expansive force of a growing plant, we determined to experiment in this direction. At first we thought of trying the expansive force of some small hard, green fruit, such as a hickory nut or a pear, but the expansion was so slow and the attachment of the fruit to the tree so fragile that the idea was abandoned. The squash, growing in the ground, with great rapidity and to an enormous size, seemed, on the whole, the best fruit for the experiment.

"Accordingly, seeds of the mammoth yellow Chili having been obtained, they were planted in the propagating pits of a plant-house, where the temperature and moisture could be easily controlled. A rich bed of compost from a spent hotbed was prepared, which was four feet wide, fifty feet long, and about six inches in depth. Here, under the fostering care of Professor Maynard, the seeds germinated, the vine grew vigorously, and the squash lifted in a most satisfactory manner. The experiment was watched day and night by relays of the scientists interested. An ingeniously constructed apparatus for testing the lifting power of the plant consisted of a frame of seven-inch boards. In this framework the harnessed squash was deposited, the harness consisting of iron straps completely encircling the squash. To the harness was attached a lever on which were placed the weights to measure the lifting capacity of the vegetable. As the growing squash elevated the weights, others were added.

"A careful record kept shows that the lifting done was as follows:

	Pounds
Twenty-first of the month	60
Twenty-second of the month	69
Twenty-third of the month	91
Twenty-fourth of the month	162
Twenty-fifth of the month	225
Twenty-sixth of the month	277
Twenty-seventh of the month	356
Thirty-first of the month	500
Eleventh of next month	1,100
Thirteenth of next month	1,200
Fourteenth of next month	1,300
Fifteenth of next month	1,400
Twenty-seventh of next month	1,600
Thirtieth of next month	2,015
Third of third month	2,1 5
Twelfth of third month	2,500
Eighteenth of third month	3,120
Twenty-fourth of third month	4,120
Thirty-first of third month	5,000

"When the squash has lifted this amazing weight the harness gave way under the great pressure, and it had to be removed. The result, however, proved that what have been regarded as fairy tales were actual facts; that a growing plant can lift a tree, split asunder the solid granite, move masses in a manner that prior to these experiments may well have been deemed incredible."
—*Philadelphia Press.*

A BENEFICENT INSECT.

Mr. James Mitchell, Overseer of the Queensland Acclimatisation Society, in his report presented at the last meeting of the Council, states: "While at the garden of Mr. W. H. Parker, Glen Retreat, on 28th February, I made what I consider a very important discovery. A magnificent specimen mango is growing in his garden, and some twelve months since, or less, the tree was very bad with the common wax scale and American or woolly blight. For sometime it had been noticed that the tree was getting cleaner, the scale and blight falling off. On examining the remaining scale, a true gardener's friend, in the shape of a natural scale enemy, was found. The insect is almost too small for the naked eye to discover unless attention is drawn to it, or by the aid of a miscroscope. From a letter received from Mr. Tryon, the insect resembles a small beetle, described by that gentleman in 1889 as being common in and around Brisbane, and that it fed on red spiders. If Mr. Tryon can identify the red spider-eating beetle and the scale and woolly blight enemy as one, then we have found a Coccinellids, or ladybird, that deserves protection of all interested in plant life, and especially orchard men. On closely examining a tree that was cleaning itself in the society's gardens, Mr. Mitchell found the same little ladybirds at work, which attacks the scale in a most active and fierce manner, working unceasingly until it forces an entrance at one side of the scale, where it enjoys itself in devouring the young scale. The larva is found killing and devouring the young scale in the same manner. As in the adult stages the larva finds its way between the leaf and the woolly blight and when a large number of these little gnats or larva gets on the smutty or scale-infested leaf, the transformation is soon made manifest. The insects may be seen now on a dozen trees in the society's gardens, and their presence is showing for itself. Fruit-growers would do well to inspect their trees, and see if they can find the abovementioned small black, shiny ladybird, about the size of an ordinary dot of ink from the pen, also the larva, at first yellow, changing to blackish brown colour, about one-eighth inch to one-fourth inch in length, usually under the scale American or woolly blight."

THE WORLD'S COFFEE TRADE.

Vice-Consul Julian Hauguitz, of Santos, Brazil, in a report to the State Department, says:

"The history of coffee export from Brazil begins at Rio in the year 1817, when 63,986 bags were shipped. In 1832 the figures stood at 478.950 bags: in 1840, 1,000,000 bags was reached; in 1851, the figures exceeded 2,000,000 bags, and kept at that average until 1857, when exports amounted to over 3,000.000 bags. In 1881 the highest mark was attained, at 4,377.418 bags. In later years the number began to decline, owing to the exhaustion of the productive power of the trees in the old districts. At Santos the records go back to 1850, when nearly 10,000 bags left this port. In 1871 the exports had grown to 500,000 bags; in 1877 to 1,000 0 0 bags; they increased in 1884 to 2,000 000 bags; in 1890 to 3,000,000 bags; in 1894 to 4,000, 00 bags; in 1896 to 5.000 000 bags; in 1897-98 to 6, 00,000 bags; near which figure production in this district is likely to maintain itself as long as the present economic conditions prevail, although the area available for coffee planting in this State is practically inexhaustible, and no soil more appropriate for the purpose exists in the world.

"For 1898-99 the Rio and Santos crops are estimated at 8,500,000 bags, and the visible supply, meaning the stocks in Rio, Santos, afloat, and in the public warehouses in Europe and the United States, had increased to 6,576,000 bags on January 1, 1899. The enormously heavy deliveries of the last year are, no doubt, to be accounted for by reason of the present low price of coffee, which latter is again a consequence of the extended Brazilian production. In the United States the deliveries of Brazilian coffee were in the following proportions:

Year.	Brazil. Bags.	Other kinds. Bags.	Total. Bags
1892-93	8,392,492	1,006,057	4,398,549
1893-94	3,160,717	1,138,128	4,29-,845
1894-95	3.167,840	1,228,106	4,395 946
1895 96	3,142,140	1,196,988	4,339,128
1896-97	3,989,057	1 099,537	5,088,594
1897 98	5,085,705	1,251.631	6,337,336
1898-99 (6 mo.)...	2 002,757	430,357	2,433,114

"The leading position of the United States as a coffee-using country—consuming now over 40 per cent. of all the coffee disposed of in the world—should make its commercial friendship a valuable desideratum to all sellers of this product and entitle it to corresponding trade concessions from the latter. This proposition applies with particular force at the present time of overproduction, when the buyer holds the balance of power, and any additional onus in the shape of taxes would have to be borne by the producer."

DRAFT ALLOWANCES ON TEA IN LONDON.

The following circular has been issued by the Secretaries of the Indian Tea Association (London), and the Ceylon Association in London:—

We are instructed to forward to you the enclosed memorandum on the proposal to abolish the draft allowance on teas sold at public auction in London, and to invite your support. We are desired to point out that it is greatly to the interest of producers and importers that the proposal should be carried into effect, and to add that it has the unanimous approval of the Committees of the Indian Tea Association (London), and the Ceylon Association in London. If you see your way to support the proposal, we shall feel obliged by your returning to either of us, as soon as possible, the enclosed form duly filled up.

Ernest Tye, Secretary,
The Indian Tea Association, London.
Wm. Martin Leake, Secretary.
The Ceylon Association in London.

I/We, the undersigned grower or importer of Indian, Ceylon, Java, or China teas, hereby agree that any teas I/we may put up for auction at public sale, in London, on and after a date to be hereafter determined by the Joint Committee of the Indian and Ceylon Associations in London, but not before July 1 next, shall be sold on the express condition that no allowance for draft be made to the buyer.

This I/we agree to carry out, provided the Joint Committee of the two Associations receive in their opinion sufficient support to ensure the adoption of the proposal.

[Here follows name of firm, proprietor, or company, and quantity represented of Indian, Ceylon, China, and Java teas.]

Memo. as to Allowance of 1 lb. Draft on Tea Sales.

1. The profit on tea cultivation having reached such a narrow margin it became imperative on the grower to cur tail every item of expenditure in India and Ceylon to the very lowest limit, and in consequence many forms of allowances which were common in better times have of necessity been abolished.

2. It has now unfortunately become necessary for the grower to extend this pruning down to unnecessary charges and allowances on his teas in London, and the most obvious of these is the allowance of one pound draft per chest or half chest.

3. This allowance has long been looked upon by the grower as an unwarrantable tax upon his teas, and it is held that the time has come for it to be abolished.

4. During last year there was imported into London:

	Chests	Half-chests.
From India	1,286,998	285,664
„ Ceylon	831,406	316,090
	2,118,404	601.754

and the allowance on these from draft alone amounted to 2,720,000 lb.

5. And this is not all; for, by the present system of weighing by H. M. Customs, a turn of the scale is given in the buyer's favour on the gross weight and another on the tare weight. Each of these may give the buyer a maximum advantage of 15·9 oz., so that the two together average close on 1 lb. of tea per package, exclusive of draft.

6. Taking then the two forms of allowance (namely, draft and weighing) together, the buyers on these figures received 5,000,000 lb. of tea more than they paid for.

7. Without raising the question of an alteration in the system of weighment there is no reason why the draft allowance should not be abolished. It is a survival from times and conditions which no longer prevail, and it is not exacted in countries other than Great Britain, to which India and Ceylon supplied last year 560,000 chests.

8. In 1890 all draft allowance was abolished on cured provisions and cheese, the same has been done in the case of bark and other articles, and the same should be done now in the case of tea.

FINE TEAS.

The *American Grocer* says:—To some persons any hot, discolored decoction of withered leaves is "Tea." They protess to be satisfied with "anything that is warm," probably because it is natural to human beings to love warm drinks. This class is indifferent to flavor, and we tender them our sympathy and compassion for the loss of a discriminating palate which God gave every human being in order that its gratification might make eating and drinking a pleasurable duty and a promoter of health.

There is as much delight to the palate of a lover of tea in distinguishing between delicate flavors as there is to the *connoisseur* of wines. In this country Formosa Oolongs are in high favor with a large class, and probably no finer teas are grown on this earth than are cultivated in the Chap Goa Hane district in the island of Formosa, which section is owned by fifteen Japanese merchants. It is from this district that Francis H. Leggett & Co. obtain their justly celebrated "Gold Fish" brand, which for the past two years we have used with the greatest satisfaction. It is of good body, has some color in the cup, and deliciously fragrant. To lovers of straight Formosa this "Gold Fish" chop will prove a source of delight.

And now a word to another class: Many good judges of tea are not entirely satisfied with the qualities possessed by one brand of tea, and therefore, they seek to supply deficiencies by a mixture of different teas, technically termed a "blend." A professional tea taster can blend teas better than an amateur, consumer, or trade as his trained palate and large knowledge of teas guide him with comparative certainty to a proper balancing of different sorts and the production of fine flavor where the mere amateur blunders.

THE THIRTY COMMITTEE IN CEYLON.

The following are extracts from minutes of proceedings of a meeting of the Thirty Committee held at Candy on Saturday, the 13th May:—

PARIS EXHIBITION

The crop of tea from the Company's Estates was 857,351 lbs. 94,370 lbs were manufactured for others, and 38,530 lbs. from bought leaf; the total output amounting to 990.251 lbs

The yield of tea was 407 lbs. per acre, the gross price realised in London was 7·1·d. per lb., and including that sold in Ceylon 6 94d per lb. against 6·90d. last year, and the average rate of Exchange 1/4 15-64ths against 1/3 15·32nds.

Read resolution passed by the Committee of the Planters' Association, nominating Mr. J. H Renton as representative at the Paris Exhibition.

Resolved:—"That the recommendation be approved, and that Mr. J. H. Renton be appointed representative of the "Thirty Committee" also at the Exhibition at a fee of £500 sterling (2) That the Secretary be empowered to communicate to the Consuls at Colombo the appointment of Mr. J H Renton as representative of the Planters' Association of Ceylon at the Paris Exhibition with request that they will notify the same to the various Consuls abroad."

APPOINTMENT OF COMMISSIONER FOR THE CONTINENT OF EUROPE.

Discussed the question of the appointment of a Commissioner for the Continent of Europe. Resolved:—"That the post of Commissioner for the Continent of Europe be offered to Mr J. H. Renton, for three years, at a salary of £1,000 sterling per annum, to cover all expenses; (2) that the sanction of the Governor in Executive Council be obtained to a further appropriation of £500 for the Paris Exhibition, and also for an appropriation of £3,000 sterling to be expended on the salary of the Commissioner for the Continent of Europe during the next three years; (3) that Mr. J. H. Renton be requested to interview Messrs. Lipton, Limited, in order to arrive at an understanding regarding the assistance asked for; (4 that Mr. Renton be instructed to bear in mind the limited funds at the disposal of the Committee and to explain this to Messrs. Lipton, Limited, at the same time pointing out the already large contribution by the 'Thirty Committee' in connection with the Exhibition

Submitted letter from Messrs. Ames and Burrell.

CEYLON TEA IN FRANCE.

Read correspondence with Messrs. Cochery and Perignon.

CEYLON GREEN TEAS.

Read letters from the Agents and Secretaries, Upper Maskeliya Estate Company, Limited, claiming grants on 12,965 lbs. Brunswick estate green tea; and from the Superintendent of Dewalananda estate, claiming grant on 5,154 lbs. of the said estate green tea. Intimated that the payments had been made.

Submitted memorandum showing the appropriations under the grant, and the balance still available, as follows:—

Balance avilable as per previous statement	...	R26,906·40
Paid grants as above	...	1,811·90
	Balance	R25,094 50

CEYLON TEA IN AMERICA.

Submitted and considered letters from Mr. Wm. Mackenzie.

Resolved:—"That the Committee confirms the Chairman's letter of the 9th May. 1899. to Mr. Mackenzie, and that he be informed that the Committee will recommend a vote of £6,000 for the year 1900."

CEYLON TEA IN GERMANY.

Submitted report by Mr. J. P. Ryan on his interview with His Majesty the Emperor of Germany. Resolved:—"That a hearty vote of thanks be conveyed to Mr Ryan for the able way in which he carried out his mission in connection with the presentation of Ceylon tea to His Majesty the Emperor of Germany, and for the use of German Army; (2) that the thanks of the Committee be transmitted to the Secretary of State for Foreign Affairs for courteous attention extended to Mr. Ryan by all the officials on his mission to Berlin; (3) that the sanction of the Governor in Executive Council be obtained to an appropriation of £2, 00 for advertising Ceylon tea in Germany; (4) that one-third of the sum of £1,134 7s. 5d. be paid to Messrs J. Hagenbeck & Co., on their letter of the 2nd May, with connected vouchers; (5) that the sum of £50 be paid to Messrs. C. & A. Böringer, as claimed by their letter of the 19th instant, with connected vouchers.

Read letter from Messrs. John Hagenbeck & Co., on the subject of their using the phrase—"Under the Patronage of the Ceylon Government"—in advertising pure Ceylon tea in Germany. Resolved: "That the action taken by the Chairman and Secretary in informing them that they could not be allowed to use the phrase —"Under the Patronage of the Ceylon Government"—be confirmed.

THE AMERICAN AND FOREIGN MARKET FUND.

The following letter, dated Calcutta, 12th May 1899, has been addressed by the Secretary, Indian Tea Association, to all proprietors and agents of tea gardens:—

Dear Sir,—The last Interim Report of the American and Foreign Tea Committee of the London Branch of the Association has recently been issued by the General Committee here to all members of the Association; to the Assam, Cachar, and Sylhet Branches, and also to the various Planters' Associations with whom the Committee are in correspondence. In this Report the American and Foreign Tea Committee quoted the following figures, which show concisely the progress made in the use of Ceylon teas in North America:—

Indian and Ceylon Tea taken by the United States and Canada during each of the last seven years.

	1898	1897.	1896.	1895.	1894.	1893.	1892.
	lbs.	lbs.	lbs.	lbs.	lbs.	lbs.	lbs.
Indian —	5,972,000	5,663,000	5,259,000	4.072,000	2,428,000	2,111,000	1,586,000
Ceylon	7,637,000	5,699 000	4,365,000	3,745,000	2,295,000	1,871,0 0	1,490,000
Totals	13,609,000	11,362,000	9,624,000	7,817,000	4,723,000	3,982,000	3,076,000

They added:

"The above figures show that a trade has now been established, which may be expected to continue to increase Your Committee are of opinion that the work Mr Blechynden has been engaged in during the last five years, since his return to America in May 1894, has been productive of much benefit to the industry, and has been well performed, but there are now so many well-established and powerful agencies at work in the United States and Canada, whose interest it is to push British-grown tea, both by means of travellers and by the distribution of samples through the post and otherwise, that the Committee consider the further expansion of the trade may safely be left in their hands, and that it is not necessary for the Association to continue a special agency for the purpose. Any further assistance that may be required should, your Committee think, take the form of subsidies."

They then went on to recommend that more attention should, in future, be given to other markets, besides the American, where the trade in Indian tea may be developed. and that a levy should be raised in Calcutta on the same lines as before, but on the understanding that the funds should be employed to push Indian teas in any part of the world, and not only in the United States.

These recommendations of the American and Foreign Tea Committee were adopted by the General Committee of the London Association; Mr. Blechynden was immediately informed of their decision, and his special mission in the United States was accordingly brought to a close on the last day of April. As will be inferred from the paragraph from the Report just quoted, work in America is not to be completely discontinued. Arrangements have been made with Mr. Mackenzie, the representative of the Ceylon Association, for the joint advertisements of Indian and Ceylon teas, which have been a feature of the operations for some time past, to be continued until the end of the present year, and the recommendation with regard to subsidies will also probably be acted upon

In furtherance of these objects, I am instructed by the General Committee to invite subscriptions to a fund which will be devoted, as has been indicated, to pushing the sale of Indian teas in foreign markets generally, and not in the United States alone. It is proposed to make a strong effort in the course of the next few years to extend the trade on the continent of Europe. An excellent basis

on which to found a campaign will, it is believed, be provided by the Universal Exhibition to be held at Paris next year. The American operations, which have admittedly been successful, were inaugurated by the work in connection with the Chicago Exhibition of 1892, and it is hoped that an equally successful scheme for France and Germany may be initiated at the Paris Exhibition of 1900. The General Committee regret they are not in a position to place subscribers in possession of detailed information as to the arrangements which are being made for the representation of Indian tea at this exhibition. Delay in completing these arrangements has been unavoidable owing to the necessity for frequent references to the London Association in consequence of the endeavours which have been made to obtain a grant-in-aid from the Government of India. The amount of this grant, if made, will, the Committee have reason to believe, depend very largely upon the support accorded to the movement by the trade generally.

In addition to France and Germany, Russia is also regarded as a promising outlet for Indian teas; Turkey and South Africa are likewise included in the programme of the London Committee, and are believed to be markets capable of great extension.

The above is, in outline, the scheme on which it is intended to work during the ensuing year, and I am to ask for contributions from the gardens owned by you, or in your agency, on the same basis as in previous years, *viz.*, at the rate of 4 annas per acre under cultivation, and half an anna per maund on production.

The General Committee trust that the measure of support which has hitherto been extended to the efforts which have been made to develop the trade in America will be increased in the attempt now to be made to open out other markets They would once more repeat that the enterprize of exploiting foreign markets is one which is undertaken for the common benefit, and which should be universally supported on the ground of a common advantage.

TEA AND COFFEE CONSUMPTION IN THE UNITED STATES.

The New York correspondent of the *Grocer* writes under date 7th April 1899:—The *per capita* consumption of distilled spirits is much less than formerly, as is the use of wines, while the use of beer is less than it was. The consumption of coffee has greatly increased, while that of tea does not grow. I have compiled the following table, comparing the *per capita* consumption of different beverages in 1893 with 1898, as follows:—

		1893.		1898.
Spirits	Gals.	1·51	...	1·10
Wines	„	0·48	...	0·28
Beer	„	16·08	...	15·64
Coffee	„	14·00	...	19·46
Tea	„	8·00	...	5·46

Probably the coffee returns are too high, as all deliveries from licensed warehouses are counted as consumption, whereas the quantity held in unlicensed warehouses is much larger than was customary in 1893, when the import cost was 7d., against 3¾d. in 1898. The tea figures are also misleading, as the withdrawals were unusually heavy in 1897 owing to heavy imports to escape the tax Making allowance for these facts it appears, unmistakably, that the use of alcoholic beverages has decreased, and the use of coffee largely increased The reason is not hard to find, as coffee is retailed at 5d. per lb. up to 1s. 6d. A pound of coffee at 5d. makes two gallons of beverage, while one pound of tea paying 5d. duty, and selling at 2s per lb. at retail, makes 6 gallons of beverage costing about 4d. per gallon, or 1½d. more than coffee. It is claimed that one pound of Ceylon and Indian tea will make sixteen gallons of beverage, which statement we will not dispute; but Americans will not learn to properly brew British-grown tea, insisting on using as large a quantity as they have been accustomed to of China or Japan sorts, and hence they do not take kindly to the heavier body and sweetish flavour of Ceylon and India. The preference is decidedly for a blend, and in this way there is a constantly enlarging demand for Ceylon and Indian tea But the Americans are particularly fond of coffee, and last year imported 851,691,054 pounds or nearly double the imports in 1880, '81, '82. The imports of tea average about 95,000,000 pounds for the last five years, while in 1880, '81, '82 they averaged 75,000,000 pounds.

THE AMERICAN TEA REGULATION ACT.

The U. S. Treasury Department has issued Circular No. 2 contained in No. 14, vol. 1, "Treasury Decisions," containing t act to prevent the importation of impure and unwholesome t and the regulations and standards which take effect on May 1-99, excepting in the case of teas shipped from abroad prior April 1, 1899, which will be governed by the old standards

Section 2 provides that the examination of teas shall be made means of samples to be drawn from packages designated by t collector and to be furnished by the importer, and of addition samples to be obtained by the examiner. The importer sh furnish a sworn statement that any samples submitted by him the examiner are drawn from packages designated by the c lector and covered by his entry (naming the vessel), and that th represent the true qualities of each and every part of the invo (including the proportion of dust), and accord with the specific tions therein contained. The importer shall submit with t entry a chop list or specification of the several lines included in t invoice, and the collector shall select for examination packag representing the different lines. The examination and repo upon such samples shall be made in accordance with the provisio of sections 7 of the Tea Act.

The following are the standards selected by the board of t experts, which are hereby fixed and established as standards und this Act:—

No. 1.—Formosa Oolong.
No. 2.—Foochow Oolong.
No. 2*a*.—Foochow Oolong (Suey Kut).
No. 3.—Amoy Oolong (to be adopted).
No. 4.—North China Congou.
No. 5.—South China Congou.
No 6.—India tea.
No. 7. Ceylon tea.
No. 8.—Pingsuey Green tea.
No. 9.—Country Green tea (Young Hyson).
No. 10 Country Green tea (Hyson).
No 11 —Japan tea—pan-fired.
No 12. Japan tea—sun-dried (Use No. 11.)
No. 13.—Japan tea—basket-fired.
No 14.—Japan tea dust or fannings.
No. 15.—Scented Orange Pekoe.
No 16.—Capers.
No. 17.—Canton Oolong. (Standard of last season to be continued force.)
No 18.—Scented Canton. (Standard of last season to be continu in force.)

COMPARISON WITH STANDARDS.

In comparing with standards, examiners are to test all the te on these points, namely: for quality, for any foreign matter on t surface of the infusion, sometimes called scum, and for quality leaf after infusion. Quality shall be ascertained by drawing accor ing to the custom of the tea trade with the weight of a half-din to the cup. In Country Green teas, Imperials, Hysons, coar leaf Gunpowders, and extra Young Hysons are to be compar with Hyson standards, and all other Young Hysons and sm leaf Gunpowders with the Young Hyson standard. The quali must be equal to standard, but the flavor may be that of a differe district as long as it is equal in sweetness. As an illustration, Teenkai may be equal to a Moyune, but a distinctly smoky rank Foochow, or Wenchow of sour character, must not be con dered as equal to the two first mentioned.

In order to test for floating coloring matter or scum, and al for the quality of infused leaf, a second drawing should be ma for any floating substance, and after pouring off the water f infused leaf should be taken out so as to exhibit the lower si which rested against the cup. Should the mass show a larg quantity of exhausted or decayed leaf, or foreign substance th the standard, it shall be considered inferior in quality, and t tea must be rejected In Greens and Japans particularly, t brightness of the leaf should be considered as an evidence of qualit

Should a tea prove, on examination, to be plainly inferior to t standard in any one of the requisites—*viz.*, quality, scum, or qual of infused leaf, it shall be rejected, notwithstanding that it superior to the standard in some qualifications. All considerat of the appearance or so-called style of the dry leaf shall be omit

Macao or Canton Congous should be compared with the stan for South China Congou and Brick tea, compared with the stan

for the district whence it comes. The mustiness or damaged flavor exhibited in certain Canton teas imported for Chinese consumption shall be considered as sufficient cause for rejection. Until the establishment of a new standard for Amoy Oolongs, they will be tested by the Foochow standard.

TESTING FOR DUST.

The dust and fannings in all Formosa, Foochow, and Amoy Oolongs, Canton teas, Congous, Indias, and Ceylons must be restricted to 10 per cent. when sifted through a sieve of No. 16 mesh made of brass wire. In order that the needle leaf and Pekoe tips may not be confounded with dust, they must be returned with the dust to the sieve for a second and third sifting until separated.

In the case of Ceylon and India teas, the needle leaf and Pekoe tips shall be separated by passing them together with the dust through a No. 26 sieve of No. 30 brass wire, after the tea has been first sifted through a No. 16 sieve.

Dust and fannings in Japan teas must not exceed 4 per cent. when tested by a No. 30 sieve of No. 31 brass wire. Before condemning any tea for dust, examiners shall sieve at least two packages.

Examiners should preserve in tin, for one year, samples of all teas examined for future reference in case of complaints, and the Board of General Appraisers should also retain a portion of all samples sent them on appeal for the same object. To this end, examiners should always send the Board samples of at least half a pound, and never otherwise than in tin cans securely labelled.

Statistics showing the quantities of various kinds of teas admitted and rejected should be kept at the custom houses for future reference.

In all cases of rejections by examiners, the importer should be notified of the reason for rejection—that is, whether it be on the ground of quality, character of infused leaf, dust, scum, or admixture with foreign substance.

Whenever Japan teas shall be imported hereafter, so made up as to imitate the green teas of China, examiners will compare such teas with the pan-fired standards for Japan teas. Should such teas be made up so as to imitate Congous, they will be compared with the North China standards for Congous.

In cases of importations of tea containing an excessive amount of dust, the dust can be exported after sifting and tea admitted to entry if found up to tea standards.

CEYLON TEA IN AMERICA.

REPORT FROM MR. R. E. PINEO.

It was neither my purpose nor intention, in a previous communication, to point out, or even suggest, improvements on past methods. My object was to awaken and concentrate interest in the arduous undertaking of making our tea better and more widely known to the general public of the United States.

The "Thirty Committee" has announced its purpose to continue the campaign in America, and has voted six thousand pounds for 1900, to further exploit and endeavour to gain greater recognition for our staple in the United States of America. It should be the study and aim of the "Thirty Committee" to solve this one knotty question, i.e. *how can the consumer be most quickly and effectually reached, and, when captured, permanently retained?* This query covers the whole ground, and embraces every feature connected with the crusade.

It now remains for me to make known how, in my opinion, the consumer is to be secured, and, of equal moment, thereafter *held!* This can only be accomplished by working *through* and *with* the *retailer*, who should be assisted, in every reasonable way, by the Commissioner. Help the retailer by advertising in the local papers and by demonstrations The retailer will then have an incentive to doing good work, as he is the only proper medium between the wholesale dealer and the consumer, whose aid should be invoked.

Once you have succeeded with, and gained the energetic assistance of, the retailer, the result is certain to be satisfactory; the consumer will be secured, and the wholesale dealer will be forced to keep and provide the retailer with everything he wants.

The representative in America of the "Thirty Committee" should be constantly on the move and work systematically. For example, let him visit Boston and every town having a population of 10,000 and upwards in the New England States; then take up the Central, Western, Pacific, and Southern States in the order named.

In each city or town let him seek out a few of the most prominent, progressive retailers, obtain their co-operation, assist them in locally advertising, and show them how best they can make attractive, popular demonstrations.

SPECIAL, LOCAL ADVERTISING.—The representative should seek and act upon the advice of the retailer, and select such mediums as he—the retailer—may recommend. In some localities, more especially where the town may be the centre of a large agricultural district, the local weekly should be availed of, as every agriculturist uses tea, and reads everything—including advertisements—that appears in his weekly newspaper.

GENERAL ADVERTISING.—Monthly magazines that are read by the masses like "Muncey's" and the "Cosmopolitan," can be occasionally used to great advantage, and there are also a few of the weekly papers that could be profitably utilised.

DEMONSTRATIONS.—One of the most successful and permanently profitable entertainments given by me was in connection with a bazaar held in aid of a large hospital, by the society ladies of Brooklyn, and what made it attractive and *remembered*, was the fact that about a dozen of the handsomest young women, daughters of society leaders, appeared in Tamil costume and served tea. The bazaar was a huge financial success, and the costumes and tea formed the subject of many a chat long after the whole thing was closed.

Now the representative should be furnished with at least a dozen washable, rich Tamil costumes, including a goodly show of native jewellery—and when making demonstrations in a shop, should engage a couple of handsome coloured women to appear in this costume and serve visitors with tea. This would prove a drawing card, and, in the smaller cities, a powerful attraction. Where it was found a Church festival or a bazaar was in progress, the feature that made the Brooklyn affair so telling, might be introduced. It may be thought that anything done, as herein mentioned, would be a slow, tedious operation, and take too long a time; but I maintain that it is the only method that will give lasting results at a minimum cost, seeing that the wholesale dealer cannot be relied upon to create a demand for an article that is not called for by the retailers, hence the latter's support must, in the first instance, be secured and his efforts assisted and fostered. The retailer is, therefore, the *one* person whose goodwill and aid should be sought, husbanded and promoted. Let the retailer work energetically, hopefully and successfully, and you have made a friend and co-adjutor of the wholesale dealer or jobber. The method herein outlined may appear to some silly, childish and imperfect, and unworthy of consideration, but—frequently—simple, direct methods lead to the greatest successes.

Later on I may, perhaps, refer to Canada and Russia.

R. E. PINEO.

SYLVIA AT THE TEA URN.

There's a trim little house at the bend of the street,
Where the lace at the window is snowy and sweet;
And it's thither I wend, to that magnet-like door,
When the silvery chimes in St. Mary's ring four;
For four is the hour that sounds gay as a song
When Sylvia pours the Formosa Oolong!

'Tis a picture to see her bend over the urn—
Her slender white wrist with its delicate turn,
The violet depths of her eyes, and the glint
Of the gold in her hair that is matched by no mint;
And then her rare smile! Oh, what rapture dreams throng
When Sylvia pours the Formosa Oolong!

The light in the room is so soft and subdued,
Just suited, I ween, to a bachelor's mood;
And the voice, ah, the voice of the tea-making maid
Has the low laughing lilt of a brook in the glade;
Sooth, life is all joy, and the world holds no wrong
When Sylvia pours the Formosa Oolong!

—*Clinton Scollard.*

CHICORY: ITS MANUFACTURE AND ADULTERATION, By A. RUFFIN.

The substance known in commerce as chicory is produced by roasting the roots of *cichorium intybus*, a plant belonging to the natural order of *Compositæ*. The plant is generally sown between the middle of April and the middle of May. and the roots are harvested in the autumn.

MANUFACTURE.

The manufacture of chicory requires several very distinct operations: (1) Washing, followed by drying by heat (2) The division of the cossettes according to their size. (3) The roasting and breaking up, the sifting, the coloring, and the packing. The washing was formerly carried out in a very summary manner, either in great vats or in running water in the neighbourhood of the drying places. Now, however, numerous plans of drying apparatus are in existence, and they are identical with those employed in sugar refineries. They are provided with arrangements for separating the roots from stones and other foreign bodies. After washing, the roots are cut up by hand, in the case of the finest qualities, but by machines in other cases. The pieces thus produced are about an inch and a half long. and are placed in the kiln on a large surface of perforated sheet iron. Here the

CHOPPED-UP ROOTS

are spread out in layers eight or nine inches thick, or thinner if the product is to be of extra fine quality. The kiln is then heated, usually by means of coke, and the removal of dried roots and substitution of fresh ones is constantly going on. After this first preparation, the roots are known as cossettes. They are sorted out according to their size by means of a bolting arrangement armed with a ventilator which acts upon the cossettes as they are projected on to the iron network of the apparatus. This process is indispensable for obtaining cossettes which are suitable in all respects for roasting, and while awaiting that operation they should be kept in a dry place and as sheltered as possible from light and currents of air. If the drying has not been properly done, the cossettes lose their colour, and change rapidly at the end of a few months. It is a sign that they have been properly prepared if they produce a clear, sonorous noise when stirred. The roasting of the cossettes is done in large coffee roasters, placed under chimneys with a strong draught and moved mechanically, except in some of the oldest fashioned works, where they are still worked by hand.

NUMEROUS TYPES OF ROASTERS

are employed. They are made of sheet iron and are about a yard in diameter. They turn over a fire of coal or coke, usually the latter. As soon as the cossettes are sufficiently roasted, two per cent. of their weight of butter is added, in order to make them shiny and to make them look like roast coffee. Then after a few turns of the roaster they are shot out, either on to the ground or into large iron vessels, to get cold. They are sometimes allowed to cool in the roaster, after its removal from the fire, another roaster full of cossettes fresh from the kiln taking its place. It is essential in order that the product may be of good quality and easily broken up that the roasting should be stopped at the proper moment, and

AN EXPERIENCED WORKMAN

recognizes the exact point by certain indications, such as the color of the smoke and nature of the smell proceeding from the cossettes. After roasting the cossettes are put into cylinders armed inside with teeth, which break them up. The stuff from the cylinders is bolted, and thereby separated into powder and grains of different sizes. Everything which does not pass through the sifters is returned to the cylinders to be broken up smaller. After this, for certain qualities of chicory, the coloring or blondissage is effected by mixing the grains with an impalpable powder obtained by the use of very heavy mills. The final process of packing is done either mechanically or by hand.

HITORY.

The Dutch were the first, more than a century ago, to use roasted chicory in preparing an imitation of coffee, of which they retained the monopoly up to 1801, in which year the process was introduced into Liege by M d'Orban, and into Onnaing by M. Giraud. After this it spread over France, and at the present time there are about two hundred chicory works in that country. The introduction of chicory was furthered in France especially by the wars at the beginning of the century, when attempts were made to replace coffee entirely or partially by indigenous or acclimatized plants.

ALTERATIONS AND ADULTERATIONS.

Properly roasted chicory is of a fine blackish brown color. When badly made or badly stored it changes rapidly It swells up by absorbing moisture from the air, thereby bursting the packet in which it is contained, and soon becomes covered with mould, consisting principally of *Peicillium glaucum* and *Aspergillus glaucus*. In this state it is evidently unfit for food. In spite of its cheapness, chicory has been extensively adulterated ever since it first came into use. In 1818, a sample was found to be largely composed of sand and powdered red brick, and these frauds became so prevalent that, in 1853, and again in 1854, Ministerial intervention took place, and the maximum ash allowable was fixed first at 6 and then at 12 per cent. To facilitate the study of the falsification of roasted chicory, the most rational method is probably to begin by seeing what are the analytical determinations to be made and what variations can be admitted in those analytical results, as shown by analyses of specimens known to be pure. It is, of course, necessary that these variations should be known, inasmuch as the composition of genuine chicory is by no means invariable, depending, as it does, on the nature of the soil in which it is grown and on the way in which the root has been prepared. In testing a sample of chicory, five determinations should be made:

1. Of the substances soluble in hot distilled water.
2. Of the loss of volatile constituents in a current of air at 100° C.
3. Of the ash or mineral ingredients.
4. Of the proportion of ash soluble in water.
5. Of the proportion of ash insoluble in hydrochloric acid.

The chemical examination should be followed by a microscopical one. To determine what percentage of the.

CHICORY IS SOLUBLE.

in water 15 grammes of it are dried at 100° C., and then ground up in a mortar with water, adding the solvent a little at a time. The whole contents of the mortar are then transferred to a flask fitted with a condenser, and boiled in it for half an hour. The contents of the flask are then allowed to cool, and transferred to a weighed filter. The insoluble matters retained by the filter are washed thereon with boiling water until the filtrate ceases to give any residue on evaporation. The filter and its contents are then dried and weighed; the difference between the weight obtained and tare of the filter gives, of course, the weight of insoluble matter in the 15 grammes of chicory.

The second determination is done by keeping twenty grammes of chicory in an air current of the indicated temperature until the substance ceases to lose weight. To determine the ash, ten grammes of dried chicory are.

BURNT IN A MUFFLE FURNACE.

at a dull red heat. In addition to weighing the ash its color should be noted. This may vary from white to red, according to the quality of the cossettes. The ash is then exhausted with boiling distilled water, and the insoluble portion is dried, ignited and weighed. The proportion of ash soluble in water is then readily obtained by difference. Lastly, the insoluble ash is made into a thick paste with pure hydrochloric acid, and dried at 100° C. The dried mass is then treated with 10 per cent. hydrochloric acid. What remains insoluble is washed, dried, and weighed. The following results have been obtained by these means with pure chicory.

1. Percentage of soluble matter: Maximum, 69.9; minimum, 62.25; mean, 6.54.

2. Percentage of matters volatile at 100° C.: Maximum, 13; minimum, 5.1; mean, 11.4.

3. Percentage of total ash: Maximum, 13.76; minimum, 4; mean, 11.4.

4 Percentage of ash insoluble in water: Maximum, 11.25; minimum, 1.92; mean, 5.8.

5. Percentage of ash insoluble in hydrochloric acid: Maximum, 10.12; minimum, 0.83; mean, 4.93.

All these figures are percentages of the weight of the chicory dried at 100° C.

The author has not succeeded in meeting with several of the adulterations mentioned in most of the special treatises on the subject, such as old coffee grounds, roasted bread, animal charcoal, colored vermicelli, semolina powder, earth, fragments of beetroot.

urf, sifted coal ashes, etc., and his results have led him to doubt hat commercial chicory is ever sophisticated with inert substances. The presence of silica and earth simply point to insufficient washing of the roots. This operation is made difficult by the more or less rregular and furrowed surface of the roots, especially when the plant has grown in a clay soil.

THE REAL ADULTERATIONS

of chicory are with leguminous seeds or roasted acorns, and such falsifications are by no means uncommon, especially as they are things which are sold by themselves as substitutes for chicory. In 33 samples bought at hazard for were found to be mouldy. Of the remainder, 47 gave a mean total ash of 9.45, the minimum being 5.8 and the maximum 10.9. Of the remaining 82, 45 gave more than 12 per cent. of total ash, the maximum being 43.2 and the minimum 20·5. In all these cases the total ash indicated that the roots had been badly washed. Seven samples were shown by microscopical examination to be slightly adulterated with coffee grounds, 18 were found by the same means to have been mixed with roasted leguminous seeds, nine were seen under the microscope to contain both coffee grounds and leguminous seeds, while three had been adulterated with roast acorns, which revealed themselves to the microscope and also by causing the infusion of the chicoryto contain tannin.—*Bulletin de la Société Industrielle du Nord de la France.*

STRAY NOTES ON MANURE.

Decomposing Bones.—H. B: The commonest plan seems to be to pack the bones with wood ashes in an old fashioned hogshead or other wooden vessel and keep the mass well moistened for several months. Or caustic lime could be used in the same way. Where there are large quantities to be treated trenches in the field may be used instead of wooden vessels. Much heat is developed and the bones are decomposed completely. Some farmers report best success from the use of crude caustic potash. Make a strong solution of this, heat until hot in a kettle, then pour over the bones in proportion of one part potash to four parts bone. Turn over occasionally for several weeks, when it is fit for use. Care must be exercised in handling the caustics, for they are liable to cause bad sores and injure clothing.

The Use of Phosphate of Lime.—Mr. D. P. Farney, Pennsylvania, writes:—The "plain phosphate" now mostly used is fine ground South Carolina phosphate rock, treated with sulphuric acid to dissolve some of the phosphate of lime which it so largely contains, because composed mainly of the bones of extinct animals. It retailed in eastern Pennsylvania last year at $11 to 14 per ton, according to the amount of actual phosphoric acid present, which is from 10 to 16 per cent. according to official analysis.

The amount applied is usually 200 to 400 lbs. per acre to ordinary farm crops, although some men think it profitable to use more. My own application last year was 10 tons to 57 acres of wheat. It is best sown by a drill with the wheat. No fertililizer in my experience has been so useful in the production of wheat and clover as this and I have no doubt M. L. Jones will get what he wants if he uses it with discretion.

Its use in eastern Pennsylvania is quite phenomenal. York county is the second county in the United States in the use of purchased fertilizers and it is probable that it now uses more dissolved rock than any county in the United States. The German farmers of this country, and there are no better anywhere in the country, have always been strong advocates of lime and have used it in large quantities on their land, but now find it won't do for wheat. This crop must have a manure rich in phosphoric acid and dissolved rock best supplies it at the lowest cost. Probably the lime left over in its dissolved condition after the wheat is made, some of it possibly in the shape of sulphate of lime, is the best possible food for clover. When Sir William Crooks said "nitrogen was the dominant manure for wheat," Pennsylvania farmers held their breath in astonishment. It is not their experience.

I look for some important lessons from our experience. First we may learn that a few bushels of the ordinary lime rock of Pennsylvania properly ground and dissolved with acid may be as effective a fertilizer, where lime alone is needed, as the large applications of burned lime now are. Next we may learn that the real problem of future agriculture will be how best to dissolve and render available the large quantities of plant food still in the soil, but unused, instead of supplying them from outside sources at great expense.

Rotted *versus* Fresh Manure.—Weight for weight, rotted manure is more valuable than fresh manure. The losses during fermentation are principally in the destruction of organic matter and nitrogen and do not under the best farm conditions lead to much loss of phosphoric acid and potash.

How to secure Humus.—Green manuring increases the store of humus (partially decayed vegetable matter) in the soil, and humus is necessary to the best conditions of fertility and productiveness, for it increases the capacity of the soil to retain and conduct water. It promotes beneficial chemical changes among the different soil constituents, changes which result in making originally inert soil materials available as food for plants. A suitable amount of humus contributes largely to the production of that physical condition of the soil which makes it possible to bring it into good tilth and to maintain it in that condition.

ARTIFICIAL MANURES IN THE GARDEN.

The Journal of the Royal Horticultural Society gives the following paper by Mr. A. D. Hall, which is applicable, *mutatis mutandis*, to the estate as well as the garden:—

The use of artificial manures in gardens is rapidly increasing, if one may judge from the number of advertisements, and the new firms that are taking to the business; and the object of the present paper is to discuss the principles that should regulate their effective and economical employment. It may of course be argued that of all places artificial manures are least wanted in a garden, inasmuch as practically perfect fruit and vegetables are grown by good cultivation with dung alone. The only question is whether the same results cannot be obtained more economically by the assistance of artificial manures, which, again, can be used to meet certain special difficulties of soil and situation in a manner that would otherwise be impossible. It must not be forgotten that artificial manures are powerful tools by which the development of the plant may be shaped by the gardener along certain directions; but, like all powerful tools, they require to be used with knowledge and discretion, or they will do as much harm as they can be made to do good.

VALUATION OF MANURES.

To learn the composition of the simple manures the gardener should refer to some book, as, for example, to Mr. Cousins' little book on the "Chemistry of the Garden," where also he will find an explanation of the proper method of arriving at the value of a manure. As to the latter an approximate way of arriving at the value of a ton of a given manure is to allow 10s. or 11s. for each per cent. of nitrogen, 1s. 3d. or 1s. 6d. for each per cent. of phosphate, or 2s. if the phosphate is soluble, and 4s. for each per cent. of potash. As an example, a manure containing 6·5 per cent. of nitrogen, 22 per cent. of phosphate, and 4 per cent. of potash is worth about £6 a ton, made up as follows: 6·5 at 11s. = 71s. 6d., 22 at 1s. 6d. = 33s., 4 at 4s. = 16s., total 120s. 6d., to which must be added a certain percentage if the manure is bought in small lots. With this preliminary knowledge of the nature and price of artificial manures, it remains to consider the specific effect of the three constituents—nitrogen, phosphoric acid, and potash—which singly, or in combination, are the essence of every manure.

EFFECTS OF MANURES.

Speaking generally, the nitrogenous manures promote growth and the vegetative development of the plant, leaf, and shoot, rather than flowers and fruit. For example, a fruit tree overdressed with nitrogen will run to wood, the leafage will be extensive and very green, the shoots will be long-jointed and soft, the buds will be wood and not fruit buds, the development of fruit will be displaced in favour of continued growth.

Of course for some vegetables it may be an advantage to promote this excessive vegetative development by the use of nitrogen particularly in early spring, when the plant naturally finds a difficulty in obtaining supplies of nitrogen from the soil. For early crops of cabbages, lettuces, peas, etc., top-dressings of nitrate of soda are a great help to rapid growth and its natural accompaniment of tenderness. Nitrogenous manures differ much in their rapidity of action; two of them, sulphate of ammonia, and especially nitrate of soda, are both extremely concentrated and immediately active; they should only be applied when the plant is growing, and several times in small quantities rather than in one application. Of course

they are only partial manures, supplying but one element of plant food, and must not be used unless the land is well stocked from other sources with phosphates and potash, or else their continued application will result in the impoverishment of the soil. But in their place, and used with discretion, they are among the most powerful agents the gardener possesses.

It is, however, among the phosphates that the gardener will find his most useful manures. Speaking generally, a garden receives lavish supplies of dung, on the whole a nitrogenous manure, and is somewhat over-rich on this side, if we may judge at least from the prevalence of wood and unfruitful growth among the fruit trees of so many gardens. It is in such places, the ordinary garden which has long been receiving dung, that phosphates and little artificial manure besides, are wanted to promote a better development of flower and fruit.

Phosphates are intimately connected with the various phenomena of reproduction, which we may sum up as the maturity of the plant. Above all they are required to balance and bring to a term the growth induced by free supplies of nitrogen.

Of these bodies nothing is better for general garden use than one of the bone phosphates, bonemeal (or, better still, steamed boneflour, as being a finer and more soluble powder), or again one of the cheap phosphatic guanos.

Basic slag is a most excellent phosphatic manure for stiff soils. It is best dug in at the rate of 6 lbs. or 8 lbs. per square rod when the land is trenched. Superphosphate is the most active of the manures of this type, but should only be used when the soil contains naturally a fair supply of lime, on the loams and chalky soils rather than on sands or gravels or the cold clays. One or other of the manures is all but indispensable in a garden. With a supply of steamed boneflour or phosphatic guano and dung a gardener need trouble himself but little about other fertilisers.

About the effect of potash, the third of our elements of fertility, little positive is known; but in a general way it may be said that where dung is at all regularly used little is required in the way of specific potash dressings. But where dung is not employed, or where the soil is of a light sandy nature and likely to be deficient in potash, it will be necessary to apply kainit at the rate of 4 lbs. or 5 lbs. per square rod every second or third year, preferably putting it on in the winter or late autumn.

In some orchards and gardens dung cannot be obtained. In such cases it is necessary to obtain as a basis for the manuring some slowly acting nitrogenous body of on organic origin, such as meat-meal, fish guano or rape dust, digging this into the ground at the rate of 8 lbs. to 12 lbs. per square rod in the winter. With it should go 4 lbs. to 6 lbs. per square rod of a phosphatic manure like steamed boneflour or phosphatic guano, and kainite every other year or so. Finally, as the plants are beginning to grow a little active, nitrogen in the shape of sulphate of ammonia or nitrate of soda may be used along with superphosphate. The gardener working without dung should lose no opportunity of taking catch crops of mustard of vetches, and digging them into the soil. The land may be brought into splendid condition by heavily manuring with artificials for a crop of this sort, and turning it in a month or two before the ground is wanted again.

THE USE OF ARTIFICIAL MANURES.

A few general directions may be given for the use of artificial manures. The best returns are obtained by applying them to growing, rather than established plants. I have seen recently planted strawberries enormously benefited by a dressing of artificial manures that produced no sensible effect on two or three year old plants alongside. As to quantities, 1 oz. per square yard, or 2 lbs. per square rod, is equal to about 3 cwts. per acre. This may be taken as an outside quantity to use of the rich and active nitrogenous manures like sulphate of ammonia or nitrate soda; of more slowly acting manures like the guanos, two or three times the quantity may be used.

For plants in pots it is better to use manures in solution—for example, nitrate of soda and superphosphate, or 1 oz. of sulphate of ammonia and 3 ozs. of superphosphate dissolved in 10 gallons of water makes an excellent liquid manure for finishing, when buds are opening or fruit is swelling. If a compost is to be enriched, let the slowly acting forms of nitrogen, like the guanos of meat-meal, used with phosphates to correspond, and let the manure be mixed with the soil some time before the compost is wanted, for the early stages of the decomposition in the soil of these manures are injurious to tender rootlets.

PLANT ASH FALLACIES.

As to the nature of the manure required for this or that cr little can be said; the gardener has not at his service the kno ledge that the farmer possesses of the specific requirements of crops; it is only for the farm crops that systematic trials have b carried out, like the fifty-year-old experiments at Rothamsted, a the many other stations that have grown up in England and e where. From these experiments and their extension by the pr tical experience of many years we now know with a reasonal degree of accuracy the specific requirements of each crop on t farm, whether its manure should be mainly nitrogenous or mai phosphatic, whether potash is wanted or no; whereas we ha nothing but general grounds upon which to distinguish betwe the requirements of a cabbage or an apple tree, an onion or rose. It is little use analysing the plant to get this inform tion: the proportions of nitrogen, phosphoric acid, and pota in a plant are not the proportions in which these substanc should be supplied in order to best feed the plant. Wh is present in the smallest proportions is often the particul substance the plant most wants; it is only present in small p portions because the plant finds a special difficulty in getting from the soil. As an instance of this common fallacy of suppos the composition of a plant's ash gives any guide to its manurin Swedes may be taken: 1 acre of average Swedes remove fr the soil 98 lbs. of nitrogen, 33 lbs. of phosphoric acid, and 149 l of potash. This material would be contained in 5½ cwts. of nitra of soda, 2½ cwts. of superphosphate, and 11 cwts of kainite; yet t ordinary manure for Swedes, one tested by many years of e perience and scores of experiments, is something like 4 cwts. superphosphate and 1 cwt. of nitrate of soda per acre.

EXPERIMENTS.

Only actual experiments can teach us the requirements of o garden crops, and experiments of a systematic sort are few number. We shall have in time results from the Experimen Fruit Farm the Duke of Bedford has started at Woburn; in commercial way we have the trials conducted by Dr. Berna Dyer at Hadlow for the Permanent Nitrate Committee, but yet these and other trials are young, and have not reached p manent conclusions. Meanwhile every gardener should have little experimental plot in his own garden; he will learn mu about his crops, and he will learn what no one else can tea him, *i.e.*, the special characteristics of the soil he is working Such a plot costs but little trouble and becomes more valual every year. An arrangement like the following gives perhaps t readiest information—seven plots side by side, each 1 square rod extent:—

Plot 1, gets no manure.

Plot 2, gets an all-round manure. A pound of sulphate of a monia as a top-dressing, 4 lbs. superphosphate or basic slag, accor ing to the soil, and 2 lbs. kainite.

Plot 3, gets an excess of nitrogen, using 3 lbs. of sulphate ammonia instead of 1 lb., as in the previous dressing.

Plot 4, gets no phosphate—the dressing of plot 2 without th phosphate.

Plot 5, gets an excess of phosphate, the dressing of plot 2, wi 12 lbs. of phosphate instead of 4 lbs.

Plot 6, gets no potash, the dressing of plot 2 without the potas

Plot 7, gets excess of potash—the dressing of plot 2, with 6 l of kainite instead of 2 lbs.

On some soils it may be well to try an eighth plot with ¼ lb. sulphate of iron added to the dressing of plot 2.

If only a number of gardeners would put down a little tri ground of this kind, growing various crops upon it from year year, and reporting their results to the Royal Horticultural Societ we should not long remain in our present ignorance of the specif needs of our garden plants. This paper has been confined to ji particular subject—the use of artificial manures in a garden—nothing has been said about cultivation, the foundation of a gardening; nothing about dung, which may be regarded as th basis of all manuring; nothing about the use of lime: these ar all points that cannot be neglected. No artificial manure will mak up for slovenly cultivation, rather they demand greater care in th direction; but the object of the paper has been to indicate and ex plain the fact that artificial manures give additional scope to th gardener's art, and that in the hands of a skilful man they may used to still further combat the difficulties that arise from soil climate.

PEPPER.

The *London Commercial Record* of 5th May says:—Our Pepper market, which for a considerable time had sorely tried the patience of its supporters by the prolonged inactivity, has at last displayed distinct signs of returning vitality, and although this has only taken the form of additional firmness, the upward move has nevertheless greatly pleased "bulls" and has inspired them with fresh hope and energy The amount of actual business, small as it has been, would probably have been even less had not the failure of a London speculator forced a number of operators to buy in the market to protect themselves against default of their contracts. Their purchasing immediately lent a tone to the market, and on the smallness of supplies from the Straits during the second half of April becoming known, the improvement already prevailing experienced a further impetus, so that at one time a boom seemed imminent. It appears that no Singapore Pepper has been shipped to London at all from the 15th until the 30th April, the total supply of this description during the whole month of April amounting thus to 20 tons only, whereas Penang provided 80 tons, making a total of 100 tons from the Straits as against 660 tons in April last year. The Continent received 100 tons in all, against *nil* in April, 1898, and America took 120 tons more during the month than last April, *viz.*, 230 tons, against 130 tons. These shipments must be considered as very small indeed and are calculated to frighten any bear of pepper, the astonishing part is that our market should not have been more seriously affected by them than it actually has been. Havre showed at once considerable nervousness, and the East also became immediately strong and advancing, but the large quantity of Tellicherry Pepper here, we presume, did not allow of any boom gaining ground in our market, although no doubt it would have received the support of all Some holders of Tellicherry Black embraced the opportunity and sold some of their spot lots at 5½d landed. Further parcels, we understand, are still obtainable at this figure, there is therefore at present no dearth of cheap pepper. For arrival, on the other hand, prices advanced from 5 $\frac{3}{6}$d. to 5½d. c.i.f. delivered weights in a single day, and we doubt very much if even at this figure first hand would be a ready seller. The following figures showing the exports of Tellicherry Pepper during the month of March may prove of interest to our readers:—

	To India.	To Europe & U. S. *via* Europe.
1899 ...	... 135 tons.	630 tons.
1898 ...	... 655 „	240 „
1897 ...	... 235 „	1,740 „

During the first three months of the year the following quantities have been exported:—

	To India.	To Europe & U. S. *via* Europe.
1899 ...	... 780 tons.	1,655 tons.
1898 ...	... 1,260 „	535 „
1897 ...	... 705 „	2,450 „

The quantity remaining unsold in the pepper-growing districts of India may be considered small, and as there exists a strong demand for it in India itself, we may take it that the shipments have reached the highest point and that April and May will show a market falling off in supplies.

THEN IT WENT ON ALL RIGHT.

The writer of the letter, which I am going to copy for you in a moment, has a complaint to make. Rather, perhaps, a complaint to place on record, as the reason for it is passed away for the present and she hopes—and we hope with her—that it may not return. The complaint does not refer to any relative, friend, or foe, but to her own heart. It did not work well It was weak, and for a long time she was unable to find means to make it do better; which was a serious matter, inasmuch as the vigor of the circulation of the blood always depends upon the force wherewith the heart drives it.

Still, it seems to me we ought to be a bit indulgent towards the heart in view of the labour it has to perform. Remember that it never takes a full minute's rest at one time, night or day, from the instant it begins at your birth until, like a muffled drum, it stops for good and all—life's funeral march to the grave being over. During all this while, ten years or a hundred, the heart has got to keep on pumping blood through your body at the rate of from 130 strokes a minute in childhood to 50 or 60 in old age. If you happen to have a mechanical turn of mind it may interest you to figure out how much this stands for in units of horse-power for a given case and time. If not, you can take my word for it that, merely as a machine, the heart deserves your respect. So long as it goes ahead steadily, up hill and down dale, hammering away softly but strongly, you haven't a word to say for or against it; but when it begins to get weak, may be skipping a stitch now and then, you call in the doctor, who puts the tip of his finger just below the base of your left thumb, looks wise and solemn (as befits the occasion), and says, "Ah, yes, yes: I see, I see" But *what* does he see? He doesn't tell you *that;* he leaves medicine, and mentions when he will look in again.

But as to the letter I spoke of. "For many years," the lady says, "I suffered from indigestion and weak heart. Very little exertion made me feel weary and tired. Cold, clammy sweats broke over me. I had a poor appetite, and after meals an aching pain at the chest and a miserable sinking feeling at the stomach. I had also much pain at the left side, and my heart would flutter so as to frighten me. At length I became so weak I was barely able to get about, being no longer able to do my housework.

"Owing to the trouble at my heart I obtained no proper rest at night, and often walked about my bedroom at night. Many times these attacks were so bad *I thought I was dying.* During the day a sense of suffocation sometimes came upon me and I was obliged to go to the door for fresh air.

"Year after year I suffered like this; now a little better, now as bad as I could be. In November, 1887, while on a visit to Croydon, my son-in-law persuaded me to try Mother Seigel's Syrup. He got me a bottle, and after taking it I experienced great relief The pain at my heart was easier, and I felt better as a whole. I could eat well and the food agreed with me.

"I now felt encouraged to continue using this remedy. Soon I was in better health than for years, the heart trouble having disappeared altogether. Since that time when I feel anything ailing me a few doses of Mother Seigel's Syrup never fail to give the desired relief. I have told many persons of the benefit I have derived from it, and hereby consent to your publishing this statement should you wish to do so." (Signed) (Mrs.) William Harrington, near Wickford Hill, Clare, Suffolk. November 12th, 1897.

Now what ailed Mrs. Harrington's heart? Why, precisely the same things that ailed her lungs, her nerves and her muscles—*weakness.* Therein she is right. It *was* a weak heart, but not a *diseased* heart. The heart is a muscle, and (seeing the prodigious lot of work it has to do) necessarily a strong, active muscle. But it will not work without pay any more than you or I will. With all the rest of the body it has got to be sustained and strengthened by food. Here we have the point, then. The lady was afflicted with chronic indigestion. For this reason her whole body grew weak—the heart, of course, with other parts of the engine Hence all the symptoms she names. Her immense all-round weakness and puller-down is that same old dyspepsia. When Mother Seigel's Syrup made the digestion of plenty of food possible, the heart went on all right, like a newly wound clock.

MARKET REPORT.

By Mail advices of 5th May, 1899.

COFFEE.

The *London Commercial Record* says:—The market continues to be abundantly supplied, and the arrears have not yet been overtaken. There has been a good demand generally. Colory Ceylon realised firm prices, but common was easier. Home trade qualities of East India sold at fully valuations, but it was almost as difficult as formerly to attract the attention of buyers to undesirable samples. Jamaica in more demand and firm prices were obtained. Fine Costa Rica elicited considerable competition and comparatively high prices paid, but middling and common declined 6d to 1s per cwt. Other sorts fairly steady. A much stronger feeling has prevailed in "futures," owing to more moderate receipts, and,

though there has been a slight reaction, the closing prices shew a decided improvement for the week, viz :—

London	... Santos	... July delivery	...	29s 3d
New York	... No. 7 Rio...	„ „	...	5.25 cents.
Hamburg	... Santos	... „ „	..	29½ pf.
Havre	... Santos	... „ „	...	35½ francs
Holland	... Good ordinary Java	..	...	27¼ cents.

Imports, Deliveries and Stock of Coffee in London are as follows:—

	Stock.		Imports.	
	1899.	1898.	1899.	1898.
Tons ...	19,321	14,380	18,212	17,875
	Home Consumption.		Export.	
	1899.	1898.	1899.	1898.
Tons ...	5,542	5,176	7,590	7,862

The preceding figures exhibit—

In the Imports an increase this year of	337	tons.
Home Consumption an increase of	366	„
Export a decrease of	272	„
Stock an increase of	4,141	„

Auctions this week have passed off as under:—

Ceylon.—*Plantation.*—17 casks 9 tierces 20 barrels 2 bags sold—smalls 38s to 60s, low middling to middling 80s 6d to 98s 6d, bold 90s to 104s, extra bold 111s, pea-berry 75s to 112s.

East India.—6,284 bags mostly sold as follows:—*Naidoobatum*, smalls 47s to 58s 6d. middling to good middling 63s 6d to 73s, bold 96s to 103s, extra bold 101s to 113s, pea-berry 89s 6d to 95s. *Mysore*, smalls 39s to 55s 6d, low middling 49s to 56s 6d, middling to good middling blue 60s 6d to 73s 6d, fine middling 82s 6d, greenish to blue bold 78s to 86s 6d, fine blue 95s to 101s 6d, pea-berry 75s to 104s. *Neilgherry*, smalls 40s to 47s 6d, low middling to middling 49s 6d to 66s, bold 74s to 92s 6d, pea-berry 53s to 85s 6d. *Coorg*, smalls 38s to 43s 6d, low middling 52s to 57s, bold 73s to 85s 6d, pea-berry 81s 6d to 88s. *Wynaad*, smalls 41s 6d to 44s 6d, low middling 52s to 55s, bold 73s 6d to 82s, pea-berry 85s. *Nelliampathy*, smalls 42s to 44s, low middling 55s, good bold 83s, pea-berry 71s 6d to 85s. *Pulneys*, smalls 43s. *Peermade*, ordinary greenish 36s.

Nyassaland.—116 bags mostly sold, ordinary pale at 26s 6d to 30s.

Jamaica.—Of 4 casks 517 barrels 79s partly sold:—ordinary to good ordinary 30s to 35s 6d, fine to fine fine ordinary 37s to 43s, low middling to middling greenish and gray 46s to 54s 6d, pea-berry 56s to 59s.

Costa Rica.—6,147 bags mostly sold, small 31s to 43s 6d, good to fine colory 42s to 65s 6d, ordinary to good ordinary brownish 33s to 37s 6d, fine to fine fine ordinary pale greenish 40s 6d to 46s 6d, low middling 48s 6d to 58s, middling colory 61s 6d to 67s 6d. good to fine middling blue 70s to 87s 6d, fine middling 83s to 86s 6d., bold 80s to 95s 6d, very fine blue 97s 6d to 101s, pea-berry 53s to 98s

Guatemala.—893 bags mostly sold, smalls 29s to 39s, fine fine ordinary 43s, good middling blue 61s to 62s 6d, fine bold ditto 85s 6d to 86s, pea-berry 85s to 90s 6d.

Salvador.—591 bags partly sold, smalls 34s to 35s 6d, fine ordinary foxy green 42s 6d. middling colory 50s to 55s, good middling 60s to 61s, good bold 67s 6d, fine bold 81s 6d. pea-berry 63s 6d to 79s.

Nicaragua.—457 bags sold, smalls 31s to 37s 6d, fine ordinary greenish 39s, low middling to middling 46s 6d to 55s, good bold 60s to 62s, pea-berry 50s to 70s.

Mexican.—415 bags sold, ordinary to good ordinary pale 30s to 37s, middling greenish colory 57s, good to fine bold blue 80s 6d to 87s, pea-berry 85s.

Colombian.—1,593 bags about half sold. smalls 28s 6d to 38s, good to fine fine ordinary greenish 38s to 43s 6d, low middling 45s 6d to 47s, bold bright gray 49s, good middling green 53s to 60s, bold faded colory 55s to 58s, good bold colory 61s 6d to 75s, pea-berry 45s to 64s.

Porto Rico.—19 bags sold, smalls 32s 6d, bold grayish 40s 6d.

Peruvian.—153 bags mostly sold—smalls 30s, fine ordinary greenish 41s, middling 49s, pea-berry 52s 6d.

Venezuelan.—Of 514 bags a small part sold. low middling greenish 46s.

Eucador.—259 bags partly sold, damaged bulked yellowish foxy 30s.

To-day's auctions consisted of 5,119 bags East India. 65 pkgs. Mocha, 99 barrels 47 bags Jamaica. 193 bags Guatemala, 1,885 bags Costa Rica, 398 bags Colombian, 177 bags Mexican, and 451 bags Salvador. The sales went off very quietly with prices about unchanged all round.

Receipts in Rio and Santos.

Since July 1	1898-9.	1897-8.	1896-7.	1895-6.
Rio	2,791,000	3,906,000	3,182,000	2,069,000
Santos ...	5,091,000	5,803,000	4,768,000	2,806,000
Total ...	7,882,000	9,709,000	7,950,000	4,875,000

TEA.

China slow of sale at rather easier prices, except for green teas, which were rather dearer. Auctions this week offered 4,142 pkgs.

Indian.—Only a small quantity was submitted at auction, comprising 9,600 packages, opposed to 14,100 packages in the week before, and 29,400 packages a year ago.

Notwithstanding the very moderate supplies there was not much recovery in quotations, though buyers were willing to operate at the reduction lately established for common and ordinary descriptions. Really good stand-out teas are becoming scarce, and desirable invoices were freely taken up at fully prior rates to a slight advance.

The catalogues included 1,200 packages from South India mainly of useful quality, which met with attention from the trade.

For 6,500 packages on Estate Account 8⅞d per lb. was obtained, contrasted with 7¾d per lb. for 16,900 packages, and 7¼d per lb. for 10,500 packages in the two preceding seasons.

The statistical position is satisfactory, deliveries from the London Bonded Warehouses for the past month being 12,793,000 lbs., whereas in the former year they were 11,155,000 lbs. The stock on 30th ult. was 17,653,000 lbs., against with 18,761,000 lbs.

Ceylon.—Nearly 21,000 packages were brought to public sale on the 25th ult. 17,500 packages were offered and 23,900 packages for this period of 1898.

Although considerable irregularity in prices was noticeable there was more competition for common to fair leafy kinds at the recent decline. Medium Pekoes and Broken Pekoes were, however, hardly so much in request and often sold fractionally lower. In spite of their relative cheapness the better grades remained somewhat neglected, and in most cases some concession had to be made in order to effect sales. The supply of finest was limited.

The average has fallen to 8¼d per lb. from 8½d, at which it stood on the 27th ult., while in 1898 it was 7⅝d per lb.

Java.—Rather over 500 packages, of direct import, passed the hammer, values being about maintained. For the 8th inst. 860 packages are declared.

Deliveries.—The clearances of all tea (on which duty has been paid) from the London Warehouses, as per official returns, were:—

From 1st to 30th April, 1899 ... ... 21,442,025 lbs.
„ „ 1898 ... ... 21,139,880 „

During the week the following have been printed for sale by public auction:—

	Sold. Pkgs.	Withdrawn Pkgs.	Total offered. Pkgs.
India	8,217	1,414	9,631
Ceylon	18,859	2,109	20,968
Java	448	64	512
Total ...	27,524	3,587	31,111

Also 138 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated May 5th, 1899, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON
From 1st June to Date.

	Indian.	Ceylon.	Java.
1898-1899 ...	1,530,223 pkgs.	1,038,584 pkgs.	43,823 pkgs.
1897-1898 ...	1,525,579 „	1,107,577 „	40,811 „

9,803 pkgs. Indian
21,065 „ Ceylon
512 „ Java
} Total 31,380 packages were offered in public auction this week.

Last month's deliveries of Indian Tea from London warehouses were again very heavy and increased the total Indian deliveries from the commencement of the season to the end of April to nearly fifteen million pounds above the corresponding period of last season, the stock of Indian Tea in London being now almost nine million pounds less than a year ago.

Indian. The small quantity brought to auction sold steadily at last week's rates. Latest enquiries indicate that very little Tea now remains in importer's hands, against sales of 115,000 pkgs., of old season Tea during May and June last year. The Official Telegram gives exports to U.K. for the second half of April as 699,000 lbs., against 354,000 lbs. last year, and from 1st April to 30th April 772,000 lbs., against 410,000 lbs. same period 1898.

Total Tea sold on Garden Account 1st June to date 1899, 1,133,668 pkgs., av. 8 78d. 1898, 1,113,726 pkgs., av., 8 67d.

Ceylon. A further slight fall was noticeable in prices, but competition was strong and bidding very general. Although Teas for price are twopence per lb. above quotations of twelve months ago, the decline in the value of better grades has been so severe that the week's average is only a halfpenny over the corresponding week last year. The Official Wire gives exports to U.K for April as lbs. 8,000,000, against lbs. 6,700,000. Exports from 1st January to end of April, lbs. against 31,000,000 same quantity last year. Estimate for current month 9½ to 10 million, against lbs. 9,500,000 shipped last May. Average for week 8·15d., against 7·62d. same period 1898.

Ceylon Tea sold on Garden Account, 1st Jan. to date 1899, 350,320 pkgs., av., 8·45d. 1898, 395,075 pkgs., av., 7·63d.

Java. The small sale passed at last week's rates.

Bank rate 3 per cent. Exchange on London three months' sight:—Calcutta 1/4 5/32. Colombo 1/4 5/32.

COCOA.

Owing to the very quiet state into which the market had fallen no auctions were held on Tuesday last. The private transactions during the week include 50 bags Trinidad at 70s to 71s for middling red, 100 bags Grenada at 69s to 70s, 100 bags Guayaquil at 75s to 76s for summer Arriba and 73s for fine Caraquez, and some Ceylon at 70s to 73s per cwt. for medium and bold.

Import, Home Consumption, Export and Stock of Cocoa in London are as follows:—

		1899.	1898.	1897.	1896.
Imports, B.P.	bags	72036	79706	62397	67031
Foreign	...	24997	46421	25276	25834
Home Con., B.P.	...	33237	41855	33616	29870
Foreign	...	20554	22248	25184	23007
Exports, B.P.	...	20042	11888	18497	14540
Foreign	...	12459	10627	15173	8684

PEPPER.

Black.—The market has presented a firm appearance this week on the continuance of small shipments (reported below), and value of Singapore has advanced $\frac{3}{16}$d per lb.—at 5$\frac{3}{8}$d for fair on the spot, with full prompt, at 5$\frac{1}{2}$d near at hand, at 5$\frac{9}{16}$d March-May, at 5$\frac{5}{8}$d May-July, at 5$\frac{11}{16}$d June-Aug., and at same price July-September shipment. The sales probably amount to 200 tons.

Auctions on the 3rd inst. presented 200 bags Penang, 4 lbs. weight, 3·03 per cent. dust per gallon, which were bought in at 5$\frac{1}{4}$d per lb.

Closing Report.—Firm but quiet.

Some Tellicherry sold on the spot at 5$\frac{3}{8}$d.

White is also firm, but business is small owing to the scarcity of sellers. About 100 bags Penang have been sold on the spot at 7$\frac{13}{16}$d to 7$\frac{7}{8}$d for fair. For arrival, no sales reported; Singapore, June-Aug. shipment, has buyers at 8$\frac{11}{16}$d, and Penang same despatch at 8$\frac{3}{16}$d per lb.

At public sale on Wednesday 71 bags good Singapore retired at 9$\frac{1}{2}$d to 10d per lb.

GINGER.

Cochin.—If possible demand in this market gets smaller and smaller; interest seems to have entirely died out. 340 bags 10 cases offered and 55 bags sold—common shrivelled D's, much dark, 16s 6d per cwt.

Jamaica a little steadier. 361 barrels catalogued and 72 barrels sold—good medium washed 70s to 72s 6d, medium ditto rather dark, 69s, dark and part lean 60s 6d to 64s per cwt.

INDIA RUBBER.

Market stagnant, but about 50 tons Bolivian sold—fine at 4s 3d, entrefine at 4s 1d to 4s 2d per lb. Para quiet, 10 tons hard sold at 4s 3d, entrefine 4s 1½d. 7 tons scrappy negroheads at 3s 5d, 15 tons Island at 2s 10¾d to 2s 10½d, 17 cases Island fine sold at 4s 3¼d.

The supply of other kinds of Rubber is rather large and demand slow at 1d lower prices generally, but not much sold.

Stocks in Havre, Antwerp, &c., are much above those of last year, so that our visible supply shows a good increase.

CINCHONA.

The Ceylon shipments from January 1 to April 11 were 1[illegible]7 lbs., as compared with 201,273 for the corresponding period of [illegible]. Since the auctions last week sales of 400 to 500 bales are repo[illegible] at an advance of $\frac{5}{8}$d. on the unit then paid. There have been nib[illegible] for the soft Colombian bark, but no business has transpired. T[illegible] exports of bark from Java for April were 996,000 Amst lbs., again[illegible] 8 0,0 0 last year, making a total for the four months of 3,021,8[illegible] against 3,225,000 Amst. lbs. last year. The shipments this ye[illegible] have been:—January, 509,800; February, 539,000; and Marc[illegible] 977,000 Amst. lbs.

The sales held at Amsterdam on 4th instant were as previous[illegible] reported, below the average, and they passed off quietly. b[illegible] although the unit declined, it was better than the value obtain[illegible] at last week's auction in London. Of the 4,439 packages offer[illegible] for sale, 3,762 sold at an average unit of 850c per ½ kilo. again[illegible] 1090c. in March. The following were the approximate quantiti[illegible] purchased:—American and English factories who published t[illegible] equivalent of 2,821 kilos; the Brunswick factory, 5,158 kilos; t[illegible] Mannheim and Amsterdam factories, 2,757 kilos.; the Frankfo[illegible] on-Main and Stuttgart factories, 2,317 kilos., and various buye[illegible] 2,274 kilos. The prices paid for the manufacturing bark rang[illegible] from 8¼c. to 76¼c per ½ kilo.; and for druggists,' from 12¾c. to 9[illegible] per ½ kilo.

QUININE.

Quinine has slightly improved its position since last Thursda[illegible] when the quotation for August delivery was 1*s* 4*d*. per oz., wi[illegible] sales in that position, and before the close of the week a go[illegible] business was done on the spot at 1*s*. 5¼*d*.; May, 1*s*. 5¼*d*. to 1*s*. 5½[illegible] and August delivery at 1*s* 6*d*. to 1*s* 6½*d*. and finally 1*s* 5¾*d*. Th[illegible] week opened at the latter figure, with a moderate business, but Tuesday sellers held out for 1*s*. 6*d*. with buyers at 1*s* 5¾*d*. but befo[illegible] the day closed some 20,000 oz changed hands at 1*s*. 5½*d*. per oz. [illegible] August delivery, the business being done by bear speculato[illegible] who anticipate a reduction of the unit at Amsterdam. On Wedn[illegible] day the market fluctuated between 1*s*. 5¼*d*. and 1*s* 5½*d*. closing at t[illegible] latter figure for August delivery. To-day no business has been don[illegible] waiting the result of the bark-sales. A record shipment of Ja[illegible] quinine has come to hand this week—viz., 175 cases, each case co[illegible] taining four 100-oz. tins, or 70,000 oz. altogether. To-day's qu[illegible] ation for this make is 1*s* 4½*d*. for 1,000-oz. lots, or 1*s*. 4*d*. for quanti[illegible] Imperial is quoted 1*s*. 5*d*.

The shipments from Java during February were 103 cases to Lond[illegible] and 25 to Amsterdam. From July 1, 1898, to February 28, 1899, 8[illegible] cases were shipped, as compared with 119 cases for the same period 1897-8. We hear that another 250 cases of quinine have been delivered [illegible] the Pandam Aroom factory of Batavia to the Dutch-Indian Government. The quinine is reported to be of good quality, and every consignment carefully examined. We simply mention this to show what Java is doi[illegible] and how the Government encourages the native manufacture; in fact, have reason to believe they have bought the bulk of this factory's outp[illegible] from the beginning.

(Average for all India 8·91d.) *May 5th.*

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittance, should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday the 9th instant. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

Coorg.

POLLI BETTA, *30th May—Weather.*—More like monsoon since Saturday, 27th. Rain daily at intervals. Amount yesterday ·45 inch. *Crops.*—Berries of the last set fairly forward, and will stand the monsoon all right if it is light at first as it promises to be. Ploughing operations begun on paddy fields. *Plant diseases.*—Borer trees being removed and burnt.

BRAZILIAN FINANCE.

EVERY coffee-planter in India should note with interest the course of any influence that affects the cost of placing Brazilian coffee on the market. Among these influences exchange is certainly not the least important, nor is the abstract question of finance in Brazil without an immediate bearing on the point under notice. We purpose, therefore, giving a few particulars regarding Brazilian finance. Not very long ago Mr. A. SCOTT BLACKLAW furnished certain information which duly appeared in these columns, but there is more to be said before the new funding scheme of the Government of Brazil can be rightly understood. This scheme came into force on 1st July 1898, and effects a considerable saving which will probably nearly effect a balance between the receipts and expenditure of the year. The following are brief details of the scheme:—The Government having decided to fund for three years, namely, from July 1, 1898, to June 30, 1901, both inclusive, the interest on the external debt and the interest on the 4½ per cent. Internal Gold loan of 1879, and also certain amounts payable annually for railway guarantees, authorised Messrs. N M. ROTHSCHILD & SONS to issue an amount, not exceeding £10,000,000 nominal capital, of 5 per cent. funding bonds, specially secured by the customs revenues, as hereinafter mentioned. The loans included

in the funding scheme are various Government and Railway loans, the amount of interest affected annually is £1,773,950, and the amount of guarantees to railways milreis 9,774,844, or, say, £1,099,670. The Carangola, receiving an annual guarantee of £27,558, appears to be the only railway company excepted from the scheme The sinking funds and redemption of the loans will be suspended for thirteen years from July 1, 1898. The funding bonds will be specially secured by the Rio de Janeiro customs revenues, and by the customs revenues of the other ports of the union, should the Rio de Janeiro customs at any time prove sufficient. On and after January 1, 1899, and *pari passu* with the issue of funding bonds, the Government will deposit in Rio de Janeiro in trust with the London and River Plate Bank, the London and Brazilian Bank, and the Brazilianische Bank für Deutschland the equivalent of the said bonds in current paper money at the exchange of 18*d*., and the paper money equivalent to the bonds issued from July 1 to December 31 ,1898, will be deposited in the same manner during a period of three years, commencing January 1, 1899. The paper money deposited will be either withdrawn from circulation and destroyed, or, if and when exchange is favourable, will be applied in purchase of bills on London in favour of Messrs. N. M. Rothschild and Sons, to be placed to the credit of a fund towards the future payment in gold of the interest on the loans and the railway guarantees. The bonds will be redeemed by an accumulative sinking fund of half per cent. per annum, to be applied half-yearly by purchase of bonds when the price is under par, and when at or above par by drawings. The redemption of the bonds by means of the sinking fund will commence at the end of ten years from June 30, 1901, but the Government reserves the right to pay off the loan at par at any time.

The most important feature of the scheme is the engagement to deposit paper money in proportion as the funding loan is issued. By this means an opportunity is given of reducing by 130.000 contos, the excessive paper currency at present in circulation, amounting to more than 750,000 contos, or with exchange at par equal to £85,000,000 (sterling), for a population of between 17,000.000 and 18,000,000 including Indians. The annual expenditure affected by the scheme, exclusive of the sinking fund and commissions, is, it appears from the figures given above, £2,873,620. The sum required for redemption may be put down roughly at between £300,000 and £400,000, in consequence of the depreciation of Brazilian bonds. From the above figures the total annual expenditure, exclusive of the sinking funds and commissions, affected by the funding scheme and conversion appears to be £3,434,567, which is met for the next three years by the deposit each year of 38,314,933 milreis, and by an expenditure of 7,790,937 milreis, which the service of the converted loan requires; total 46,105,870 milreis, against 137,382,680 milreis, which the same sum in sterling was costing the country at 6*d*. Until the end of 1899 the advantages of the arrangement are unfortunately counteracted to a certain extent by the new obligations contracted at the end of 1897, *viz.*, the internal loan of 60,000,000 milreis requiring an additional annual expenditure of 9,600,000 milreis (£320,000), and the £2,000,000 gold loan, the last instalment of which is due on January 1, 1900. It is in 1900, therefore, that the full benefits of the funding scheme will be realised

Meanwhile, let us note whether progress has been ma According to the *Brazilian Review* of the 11th April 18 besides having already burned 8,000 contos of reis in co pliance with the conditions of the Funding agreement t present Government has repaid to the Bank of the Re 11·000:000$ borrowed in those hard-up times, has redeem 20·250:000$ of Treasury bills and at the same time attend religiously to its obligations abroad without issuing a sin Treasury bill of any kind, and yet has to its credit at t Bank of the Republic, instead of the usual debit, the han sum of nearly 2·600:000$ All this has been done out revenue by the exercise of economy in expenditure a better methods in collection. Opinions are somewhat div ed as to the burning of paper money. The following rema by a writer in Brazil represent one view of the matter: "The paper money, therefore, that is being destroyed is, the first place, an advance made to Government out of t Capital of Commerce, whether foreign or native does n matter, seeing that this advance has finally to be made go through the squeezing of agriculture. In this way it com about that agriculture has to work for nothing, so as to enab the Government to tear up a lot of its, the Government broken promises to pay. The question then becom what advantage can accrue to agriculture from this? Ag culture has, from now and for ever afterwards, freed its from any possibility of these same notes ever being presen ed at the counter of any Bank with a demand for any mittance draft, with a demand for a share of the agric tural gold mined by the Nation. Agriculture has tak the distribution and destination of its future wealth m fully into its own hands.

The foregoing, moreover, is only one aspect of t question, one only of the advantages to accrue. The ot advantage is that the Government being out of the exchan market it follows that what the direct creditors of Government fail to receive during the *moratorium* must to the commercial creditors of the Nation. At the end the *moratorium* the direct creditors of the Government w be out of pocket some, say, 10 million sterling, but Commercial creditors of the Nation will be in pocket j that same amount. In other words the Nation has s ceeded in arranging for creditors who in future will co affect the distribution of the yearly charge; and will h got rid of another set of creditors whose payment entai meddling with the distribution and destination of yearly wealth of the Nation to the full capital amou the indebtedness." We shall have something to say i future article on this view of the action taken by Brazilian Government.

OUR PRIZE ESSAY COMPETITION.

Only *one* competitor has entered the field! We nothing to be gained by extending the time for submiss of essays unless there is a certainty of more enthusia rivalry. If, therefore, we do not receive by the l instant "entries" to the extent of at least five or si in other words, declarations from 5 or 6 planters t they are willing to compete—we shall let the ma drop. If the names are sent in, we will extend the t to 15th July making that the last date on which es will be received.

NATURAL RENOVATORS OF SOILS.

Under this head, Dr. Wm. C. Stubbs makes some interesting remarks in the *Hawaiian Planters' Monthly*. The leguminous family of plants is, he points out, a very large one, and every civilized country has adopted one or more of them for food and fertilizing purposes. They all have nodules on their roots, filled with microbes, which, while they draw much of their support from the plants upon which they live, yet supply themselves in a manner not yet clearly understood, with nitrogen drawn directly from the air. Having only an ephemeral existence they are rapidly absorbed after death by the host plant, which, so to speak, gets back what the microbe has taken from itself with the addition of the nitrogen appropriated from the air. The microbes in fact "board" with the plant and eventually pay for their "keep," partly in nitrogen. Dr. Stubbs considers that "only by the practice of planting leguminuous crops can we hope to economically and profitably restore the nitrogenous matter to our soils, and that only by the study of the composition, individuality and adaptability to our surroundings of the various leguminous crops can we select one or more which will accomplish the above results in the shortest time" He reminds us, however, that in the cultivation of these crops only nitrogen is gathered from sources exterior to the soil. Whatever of phosphoric acid, potash, or lime is needed by these plants must be obtained from the soil; so, if the latter be deficient in any of these ingredients, they must be supplied before large crops can be produced. He specially mentions Alfalfa, Crimson and Red Clover, Lespedeza, Hairy vetch, Spanish peanuts, Cowpeas and Velvet beans as useful plants, and remarks that, other things being equal, that crop which will produce the largest amount of nitrogen, obtained from the air in a given time, is the best crop to grow for fertilizing purposes. Which plant, in Southern India, answers to this description?

TEA AND THE AMERICAN CLIMATE.

Mr. MacCombie Murray lately sent the *Ceylon Observer* a letter from Philadelphia, with long inclosures showing the opinions of leading dealers with respect to Ceylon teas, and the prospects of their converting American taste. Commenting on this, our contemporary remarks that the curious fact is that neither Mr. Martindale (one of the American dealers referred to), Mr. Murray, nor any of the other writers in this tea discussion stumbled on the proper answer to the objection raised, that while Ceylon and Indian teas might do very well for the rainy, damp climate of England, they were unsuitable for the dry, electrical climate of the American States. The *Observer* proceeds:—"The objection is that our teas have too much tannin for the latter condition. Now, apart from the fact that the proportion of tannin drawn off into cups of tea can be regulated by the time given to the infusion—what do Messrs. Martindale, Robertson, and others of our American cousins say to the case of Australia, with its far drier and more electrical climate than any to be found in the States? Here are the Australians—a nation of athletes, beating the English at their favourite game of cricket—drinking tea (mainly Ceylon and Indian) at the rate of 7 lbs. per head per annum! Where are the bad effects? Does their experience not prove that tea is just the beverage for the people of the United States from New York to San Francisco, New Orleans to Chicago and Philadelphia to Denver? If our American cousins only took to tea, up to 2 lbs. per head per annum, they would benefit themselves and tea growers everywhere!" No doubt, but we can scarcely regard our contemporary's remarks as *practical*. There is no occasion to bring Australia into the discussion, unless it is asserted that the climate of that continent is similar to that of the United States! As for the supposed "electrical" climatic effects, it is pretty clear that there is something more than differences of electricity between the English, the American and the Australian climates. There is also a very great difference between the peoples of those lands, and the fact that Ceylon teas suits Australians is no indication that it would also suit Americans. At any rate, neither Ceylon nor India teas can be forced down unwilling throats. Either the Americans must be "educated" up to the level of India and Ceylon teas, or these must be so changed in character as to adapt themselves to American taste; the alternative is—a want of success in the attempt to secure the lion's share of the Tea trade of the United States.

CHINA *v.* INDIAN TEA.

In a short paper, which we reprint on another page, the *Grocer* utters a timely warning as to the preference entertained for Ceylon and Indian teas. Our contemporary plainly states that planters should not rely too much upon this preference, as there are times when none is shown. In certain conditions of the market, China leaf will be bought just as readily as other sorts, and the mere name "Indian" or "Ceylon" will have no influence. It is unwise to allow fixed ideas to dominate one's anticipations. Not long ago we heard a good deal about an imaginary ring of buyers in England who were in league to hold tea prices down. More recently there were some imaginary wholesale dealers who would not buy China teas at any price—perhaps would not accept them as a gift! This is the sort of thing that planters should not heed. In the long run, the mutual relations of supply to demand are what planters have to consider, and that is all. Give the qualities that are in demand, and not an excessive quantity of any of them: then prices must be maintained. Whenever one sort or more is offered too freely, then prices fall. When one is not offered in sufficient quantity, either prices rise or buyers take something else. The fall, consequent on an excess of supply, may be anticipated with certainty, the rise that should follow a short supply is highly uncertain. In most instances, buyers have a prejudice against paying beyond a certain level of price for any given quality, and, if they cannot get this quality at their price, they are apt to content themselves with anything they *can* get at the figure. We entirely agree with the *Grocer* that, under certain conditions, London buyers would take China teas just as readily as Indian or Ceylons. Still, if the quality of the latter sorts is well maintained, they need fear nothing from the competition that is inevitable. They have won in the past, and there is no reason why they should not pile victory upon victory in the future.

COFFEE IN DISTANT LANDS.

Trinidad.—The Annual Report of the Royal Botanic Gardens, Trinidad, for the year 1898, contains the following interesting notes :—

The trees of the new coffee (*Coffea stenophylla*) have again borne excellent crops for the second season. The seed has been much in demand; but I am sorry to say our local planters have not as yet taken any general interest, and most of our crop has gone abroad. The tree bears a small purple berry of the Mocha type, and the flavour of the coffee is excellent. A small area has been planted at St. Clair. Our seedling plants, when about six inches high, met very wet weather and were badly attacked by *Cerospora coffeicola*, a leaf disease which is generally present among seedlings. Curiously enough, this fungus was mistaken by a French buyer for the deadly *Hemileia* of Ceylon, and considerable scare was caused in consequence. *Hemileia*, however, has not yet been seen in Trinidad.

Maragogipe Coffee, or Brazilian coffee, a variety of *Coffea arabica* has produced a large crop of beans for the first time, a fine coffee, of vigorous habit and has a much larger leaf than ordinary *C. arabica* with beans of nearly double the size. Vilmorin, of Paris, calls it *Café géant du Brasil*, and it is certainly deserving of the name.

Abbeokuta Coffee.—This coffee is of the Liberian type and resembles it in vegetative characters It was found in the district of Abbeokuta, on the way to the interior from Lagos, west coast of Africa. A small patch has been planted for trial at St. Clair.

Congo Coffee.—This is a coffee similar in appearance to the last, and was received from Kew under this name. It it said to be a valuable kind; but the plants are yet too small to indicate what type or character they will finally assume. They are growing well.

Minerva Coffee.—For some years we have had under cultivation a variety of *Coffea arabica* which has hitherto been called "narrow leaved." This has now proved itself to be a very early fruiting and prolific variety, and has been named 'Minerva Coffee" for convenience of nomenclature. The beans are of large size and possess a very fine flavour.

Mexican Coffee.—This is another of the interesting introductions which are always being received through the Royal Gardens, Kew. It is a variety of *Coffea arabica* and has proved itself to be a prolific variety, and possessing a strong constitution.

Golden Drop Coffee.—This is a variety in exchange, but about which we have received no definite information. It is a variety of *Coffea arabica*. It will be tried on the new grounds at St. Clair.

The culture of coffee in Trinidad is certainly extending, somewhat slowly it is true, but still extending. The Botanical Department has sold large numbers of plants at four for a penny, which should be cheap enough to encourage planting. There is, however, a general disinclination to cultivate coffee for itself, and it is usually looked upon as a plant for the edges, and odd corners. Some few are now commencing on different lines, and it is to be hoped that others will soon follow their example.

Ecuador.—The coffee crop of 1898 did not reach the expectation of the planters, the production of this article being but little in excess of the past year, although a much larger area is under cultivation. The decrease in t market price of this staple has been the cause of plant turning their attention again to the cultivation of co which in a few cases was abandoned for that of coffee w the price of the latter rose considerably. and the gen impression was that it would retain its higher value. Th were 36,800 quintals (say, nearly 1,600 tons) available export, against 26,126 quintals (say, nearly 1,200 tons) 1897.

Java.—The British Consular Report for 1898 says :—T rainy weather, which distinguished a great part of usual dry season, proved less advantageous for coffee th it undoubtedly was for sugar, as it interfered greatly w the blossoming of the trees, and consequently the ye crop instead of being heavy, as hoped for after the su majority of estates. Of course the trees have grea benefited, both by the rain and the rest from fruit-beari and only require favourable weather during next blosso ing season to produce plenty of coffee. Owing to a sev drop in prices, especially for the Liberian variety, ma estates are finding the culture unprofitable, and, should improvement take place, it is to be anticipated that no few will ultimately be abandoned. Meanwhile, one or t of the less favourably situated lands are being closed realised by public sale. The actual figures were—

	QUANTITY.	
	1897.	1898.
	Tons.	Tons.
Government	28,880	5.042
Private	26,400	22,100
Total	55,280	27,142

A CO-OPERATIVE SHIPMENT OF COFFEE.

A letter was recently issued to members of the Monteag and Pedro Agricultural Society, in the West Indies, st ing that the Council had decided to make a co-operat shipment of coffee to London and the conditions un which the shipment would be made. The shipments wo be open only to members of the Society. Any mem desirous of taking part had to deliver the coffee prope securely and cleanly packed by a certain date. All coffee received at the wharf on the day named would shipped to a firm in London. No quantity less than barrel or bag would be received. Each parcel (bag barrel) had to be sound and clean and clearly marked w a distinctive mark, which the sender must see shown his voucher. Should any parcel from any cause in special expenses, these would be charged against the par in question. All wharfage, freight, and all charges London (except brokerage and commission) would divided over the shipment and charged to each parcel proportion to the shipping weight, not to the val Brokerage and commission would be charged as a perce age on the total proceeds. When account sales arri out, notice would be sent to each shipper. and he wo receive the gross sum for which his parcel was sold, l the proportion of expenses charged to his parcel.

It will be interesting to learn how this experim turns out.

NOTES.

Tea in Palestine. According to the *Planter*, experiments in Tea planting are being made in Palestine.

Coffee Sales in Amsterdam. In Holland the clearances of Java Coffee by the Dutch Trading Company during April were about 17,000 bags, against 15,150 bags last year, and 16,500 bags in 1897.

The Calcutta Tea Sales. On 26th ultimo 7,000 packages were offered and 6,000 sold. There were fewer desirable liquoring kinds offering than at last sale. For those catalogued, however, there was a good demand. Common and broken pekoes were somewhat neglected; and pekoe souchong prices were rather lower.

Cocoa in Java. Exports of cocoa in 1898 showed again an increase on those of 1897 of about 20 per cent. and prices in Europe were well maintained. The trade in this article done with the Philippines has almost ceased since the recent troubles in that quarter.

Danger of importing Insect Pests. Of the 73 species of insects most injurious in the United States, 37 have been undoubtedly introduced from foreign countries. The great majority of introduced species have come from Europe. Mr. L. O. Howard regards nursery stock as the most dangerous means of importation of insect-pests.

South Indian Estates in the Market The Glen Morgan and Mount Gordon estates, near Ootacamund, will be offered for sale by public auction by Messrs. Somerville & Co., London, at their rooms, on Friday, the 29th of September (unless previously disposed of by private treaty). The acreage of the two estates is 438, and they are planted with tea and cinchona.

European Stocks of Coffee. According to Messrs. G. Duuring & Zoon, European stocks on the 1st ultimo showed an increase of about 5,550 tons, and the visible supply a decrease of about 7,130 tons, being estimated respectively at 233,250 tons and 378,040 tons, against 227,700 tons and 385,170 tons on the 1st April.

Brazilian Coffee Crops. Aggregate entries for the crop to 14th April are 1,735,705 bags less than for the corresponding period last year of which they represent 81. 5%. On this basis a Rio estimate for the current crop is as follows:

Rio	3,078,292
Santos	5,439,249
Week ending April 14th	8,517,541

Railage on Tea in Russia. The Russian Minister of Finance has sanctioned, dating from the opening of regular traffic on the Trans-Caspian Railway in January last, the transit conveyance of green tea by that railway to the Custom House of Kokand from the ports of Batoum, Baku, and Krasnovodsk, on the same conditions as those on which such transit importation is allowed at the Askhabad and Bokhara Custom Houses.

Ceylon and China Teas in Australia. The *Times of Ceylon* states that private advices from Australia tell of a great run on China teas in the Australian market, owing to the recent rise in Ceylon prices. Stocks of China teas are said to have been almost cleared out, as the Australian consumer will not pay more than a certain amount for his tea, and if he cannot get it at one place for that price he will go elsewhere.

Imports of Fertilisers into Java. The import of sulphate of ammonia into Java, which increased during the year 1898, may be estimated at about 10,000 tons. Other fertilisers containing nitrogen, such as bean-cake, cotton-seed cake and dried blood, have not been imported to anything like such an extent in 1897, but the import of "poonac," that is, *arachis* (bean-cake) from British India, seems to have increased very considerably.

Sovereign Tea. Certain Sunderland grocers complain of a system which, they think, comes within the meaning of the Lottery Act. The system appears to be to send female canvassers from house to house, and those travellers inform the people upon whom they call that every Saturday, before the parcels of tea are sent out, several sovereigns and half-sovereigns are placed in packets at random. So buyers naturally think they have a chance of getting some gold "given away with a pound of tea."

Coffee and Cocoa in Spain. The following are the values of imports of Coffee and Cocoa into Spain during the last three years:—

	1896.	1897.	1898.
Coffee	£747,000	£645,000	£536,000
Cocoa	£400,000	£404,000	£385,000

The falling off in coffee is serious. As for tea it is grouped with "groceries," so the extent of the tea trade cannot be ascertained. Tea "groceries" fell, however, from £73,000 in 1896 to £65,000 in 1897 and £49,000 in 1898.

Steam-ploughing on Tea Gardens. A correspondent of the *Planter* holds that a consideration of the question as to whether steam-ploughing could be wholly or partially introduced as a substitute for manual labour in tea gardens, is one which might well occupy the attention of those interested in tea cultivation, especially in those districts where labour is scarce. As regards South India, at any rate, we scarcely think the subject is one that need be discussed until several others of much greater moment have been threshed out.

Tea in Canada. The *Canadian Grocer* of 28th April says:—"Retailers are still reported to be fairly good buyers of tea, but the wholesalers at the moment appear to be lying on their oars. This refers to Toronto. From Quebec it is reported:—'A much stronger feeling has developed in the market for most grades of teas, and prices are steadily advancing, especially for Ceylons, China blacks and gunpowders, which are becoming scarce, to some extent, as the demand at present and for the past two weeks or more has been chiefly for the above grades.'"

The Colombo Tea Sales. At the public sale of tea at Colombo on the 24th ultimo about 10,937 pkgs. = 846.905 lbs. were offered, of which about 9,407 pkgs. = 745,007 lbs. were sold. A decidedly better feeling was noticeable at the auction, due no doubt to the improved quality of some of the invoices offering, and all teas were well competed for. Common and medium grades were in strong demand, and fetched full prices. Among the best teas in the sale were, says the *Times of Ceylon*, Devonport, Naseby. Middleton, Glasshaugh, and Blinkbonnie.

Adulterated Coffee. An interesting point was recently raised by a grocer who has six or seven shops in Birmingham, each in charge of a manager, who was instructed to sell all goods for what they were, and in no case to supply an adulterated article. Yet recently one supplied an article as pure coffee which contained 74 per cent. of chicory, and charged 1s. 8d. per lb. for it. No doubt the fault lay with the manager, but the case surely shows that it is necessary that the responsibility of the assistant should be recognised by the Government where a trader has a number of branch establishments.

Plants and Coloured Light. The report on the work of the Station of Agricultural Climatology at Jervisy (France) shows that, as a rule, the greatest growth was made in the red light. Sensitive plants did best under a slightly diffused light; with Strobilanthus and Coleus intensities of 65 and 50 per cent. respectively, were most favourable to the growth of the vegetative organs. The behaviour in this respect differed widely with the species of plant under trial. We may add, parenthetically, that the writer, M. C. Flammarion, concludes that there is no relation between the phases of the moon and the character of the weather.

Tea. An experienced planter writes to the *Ceylon Observer* anent a remark of the *Times of Ceylon* that old tea bushes are more sensitive than young to changes of weather. The planter says:—"Well, that is quite opposed to the general opinion. When the bushes have their tap roots well down the trees are less sensitive to such changes than in the young state of growth. The Colombo market is very sensitive to adverse circumstances. Let the London market go down ⅛d, it will go down three cents. A scarcity of freight is also made an excuse of buyers slowing off. Except for Australia and direct shipments to Continent, the Colombo market is not to be relied on."

Ceylon Tea at Coolgardie. Mr. Jules Joubert, the General Manager of the West Australian Exhibition, at Coolgardie, writes:—"The Ceylon tea-room has, as I anticipated, done an immense deal of good. It has opened the eyes, not only of West Australians, but of many of our visitors, to the fact that these colonies, where tea is consumed in such enormous quantities, have been and are *poisoned*." He believes in establishing a special agency to push the trade, but remarks that the great thing is to have in Ceylon some expert to mix or blend the teas so as to ensure a constant supply of *one* sample of each grade—cheap, medium, good and superior—being four prices—the first, of course, will command a huge sale.

Tea in Java. The export of tea for 1898 was again over the previous year's figures, being 12,100,724 lbs., against 11,218,569 lbs. in 1897, 9,568,732 lbs. in 1896, and 10,146,800 lbs. in 1895. These figures sufficiently substantiate the views expressed in reports from this Consulate that exports would increase in the future. Although the increase is marked, the British Consul remarks that the limit has not yet been reached by a long way, as new estates are being continually opened whilst those working are increasing the acreage under cultivation. Prices for the article were good, and planters have no reason to complain. During the year 263,067 lbs. of Amoy Oolong, and 969,334 lbs. of Formosa Oolong were imported into Java solely for the consumption of Chinese who do not seem to care to accustom themselves to the local-grown article.

Coffee in Sylhet. On 20th ultimo the South Sylhet correspondent of the *Planter* reported:—The weather seems to be even more favourable for it than it is for tea. The "droppy" weather we are having seems to favour the development of next year's fruiting wood to an extraordinary degree. The berries on the bushes are swelling away rapidly, and the Liberian variety is ripening off last year's set of berries, selling away what the bushes set last March and preparing to open another flush of blossom. Both varieties are keeping in the pink of health, and, unlike the tea bushes I have seen lately, have not a sign of any kind of disease or insect pest whatever. From a letter to hand a few days ago from Jalpaiguri it appears that Arabian coffee has been growing there in a tea garden for many years. The bushes are over ten feet high and never have had anything done to them. But it appears now this garden is going to open out a coffee garden.

The Florida Velvet Bean. In the annual report of the Agri-Horticultural Society of India we read:—"*Mucuna pruriens*.—The Florida velvet bean, regarding which so many articles have appeared in *Indian Gardening* during the past year, has been experimented with on a fairly extensive scale; but, so far as results go, it seems in all respects to resemble our Kamach (*Mucuna nivea*). The experiment was taken up at the request of a correspondent in America, in whose opinion this "new bean" would prove of great benefit in famine-stricken tracts; the first batch of seeds cost five shillings a pound, but the produce in no way

xcelled that of our indigenous species, which can probably e obtained at five farthings a pound. This bean appears have been put on the market for sale in the same manner nat the so-called improved form of *Lathyrus silvestris* as foisted on the public five years ago, and regarding hich nothing is now heard."

Lucerne"—a favorite Fodder.

The following is from a recent number of the *Rural Californian* :—Alfalfa is better than a bank account, r it never fails or goes into the hands of a receiver. It weather-proof, for the cold does not injure and heat akes it grow all the better. A winter flood will not own it, and a fire will not kill it. As a borer it is equal an artesian well; it loves water and bores to reach it. hen growing there is no stopping it. Begin cutting a 20-re field, and when your last load of hay is handled at one d of the field it is ready to cut again at the other end. For ling a milk can, an alfalfa-fed cow is equal to a handy pump ttle love it, hogs fatten upon it, and a hungry horse wants thing else. If your land will grow alfalfa you have the op on dry weather. Once started on your land, alfalfa will y by you like Canada thistles or a first-class mortgage, t only to make you wealthier and happy. Evidence of the ofitableness of alfalfa or irrigated land in the semi-arid gions multiply from year to year.

Preservation of Eggs.

A comparatively novel method of preserving eggs, which is probably best yet tried, has been thoroughly tested at the tario Agricultural College, says the *Standard*. The pre-rvative is silicate of soda, commercially known as "water-ss." A solution of this substance in the form of syrup s tried in three strengths—10, 15, and 20 parts of water pectively to one part of water-glass. The strongest ution was found too strong, as the eggs floated in it; l the weakest was perfectly satisfactory, the eggs kept it being quite fresh, and having their yolks in proper ition (instead of clinging to one side, as in ordinary le eggs) at the end of six months. The eggs should be ked in the vessel in which they are to be kept, and the ution poured over them until it covers the top layer. e water should be boiled to kill putrefactive organisms it, and then allowed to become cool, after which the ter-glass should be well stirred into it. As the solution os up the pores of the eggs, each one should be pricked h a needle before it is boiled, otherwise the shell will ck.

---

zilian Coffee.

Replying to inquiries recently made by the *Brazilian Review*, a planter the Sorocaba district writes as follows :—"Generally ering in this district, up to 1897, took place up to the of September and but rarely in October, November December. In 1898, however, the best flowerings e in the early part and middle of September and first s of October. After that only partial flowering was to oticed. Up to 1897 harvesting never commenced until end of May, June or July. This year, however, coffee ripen and be ready to be picked by the end of April, act, I intend to commence by that date myself. The nge of climate is here attributed to the devastation of the forests, which accounts for the change in the harvest-time. As regards the coming 1899-1900 crop, it is difficult to give an opinion without having visited every district; but I am able to inform you that in the Municipality of S. Manoel the crop will be good, of Botucatú and Tieté very fair, and at Avaré and Itatinga small. As regards the sertão (newly planted districts) I am informed that the crop will also not be bad. 'Café das Aguas' is not common in this district though a little is to be found with the rest."

Dry Rot.

The May part of *Building World* contains an article on "Dry Rot in Timber and its Prevention." Amongst other recipes the writer says :—Substances, such as paint or tar, that imprison moisture within wood or prevent its free evaporation, should never be used on damp or badly seasoned timber. Painting the ends of beams, joists, and all timbers touching the walls, with creosote has been found to be very effective in keeping out damp. It coagulates the cell contents, thus giving solidity to young cells; it absorbs oxygen from the cell: it resinifies within the cells, and so excludes air and moistures; and it acts as a poison to fungus. Several other preservatives against damp and dry rot have been suggested, the best being, perhaps, jodelite and carbolineum avenarius. These preparations are applied hot, with a brush in the same manner as ordinary paint, and it is claimed for them that owing to their powerful penetrating properties they drive out all moisture, and make the wood impervious to damp. Timber of large scantling is sometimes, while appearing perfectly sound, quite rotten internally, where strings of mycelium permeate the core. It is wise, therefore, to have all large timber sawn in two parts, which can then be reversed and bolted together, care being taken to insert strips of wood between the pieces so as to form an air space. As a further precaution, the inside face of each piece might be painted with creosote, jodelite, carbolineum, or corrosive sublimate dissolved in alcohol.

Coffee in Dibrugarh.

The following has been sent to a Calcutta contemporary by a correspondent at Dibrugarh :—My coffee bushes have flowered four different times ranging over as many months, and they are still throwing out occasional clusters of flower. During one of these flowering spells it rained, or rather drizzled, for four whole days without interruption or intermission. Not a single blink of sun was discernible during that time, nor for six days after, and then he only looked out for a couple of hours or so once or twice during the next six days. There was at the time, I should say, about one-fourth of the entire crop of blossom open. For nearly a fortnight after all the blossom had disappeared, I examined the bushes daily and was at first inclined to think that they had all set, but after the weather cleared up and commenced to get warmer, I very soon found out that I was mistaken, as only about half commenced to swell. The other half at first took on a whitish tinge, and after a time turned black and dropped off. The coffee bush is, however, as far as my experience has gone, a most wonderful bush, and moreover would appear to be a most determined one. Notwithstanding the fact that almost all sorts of climatic influences have been brought to bear to wreck its productiveness, it appears to be still determined

to produce a fair average crop. I find on examination that there are no less than four different sizes of berries on these bushes; varying in size from a very large pea—nearly half full size—to slightly larger than a pin head. And between these clusters of berries, as well as at the extreme ends of the branches, the bushes are still forcing out flowers.

The London Coffee Sales.

The *London Commercial Record* remarks:—It is satisfactory to be able to report some improvement in Mincing-lane trade, be it ever so slight. . . . The bear clique has proved itself too strong once more, but the believers in a rise are steadily increasing in number, and bulls may prove victorious yet Among others coffee made strenuous efforts to shake off the terrible depression from which it has been suffering so long; its endeavours, however, were seriously handicapped by the enormous supplies of actual coffees of all descriptions. Yet an advance has been gained in some descriptions. Huge catalogues have to be waded through day after day, and the sales have become so congested that brokers are unable to tell within a week when their turn to sell will come. No wonder, therefore, if buyers become independent and smile at the efforts of holders of spot coffees to increase the value of their goods buyers pick and choose and discriminate to their hearts' content, and the poor holder has no alternative but to concede to their terms or be left with his coffee, the cost price of which becomes daily enhanced by accumulating charges. Fine colory East Indian sorts are selling at ruinously low values, and the planters in the East will derive but scant remuneration for their labour. Their position is not an enviable one at the moment by any means. With heavy losses this year—at any rate, in many instances—they see little chance for a recovery in the ensuing season, for exceptionally early and heavy rains have caused serious damage to their growing crop, and short yields, it is feared, will result. Capitalists with a speculative turn of mind might do well by buying these colory coffees at the present low prices and holding them for several months.

LETTERS TO THE EDITOR.

TEA PICKING.

Sir,—I should like to know if the following record pick of tea leaf has been beaten on these Hills. The field is one planted in 1889 with plants from our own seed, off indigenous single plants. The pluckings fairly fine, *viz.*, two leaves and a bud. The field had its first low prune in July last only. The individual figures for fifteen pluckers are as follows:—58, 37, 50, 58, 60, 60, 60, 46, 55, 63, 64, 54, 48, 56, 59. The 68 was picked by a little Badaga girl, named Gunghee, who is about ten years old only I do not pick by contract, but give small rewards now and again for merit. I have never, in my eighteen years on these Hills, had any better picks! The total into the factory for the day was 3,350 pounds, beating the previous highest record by 350 pounds. But for a heavy downpour of over an inch, lasting over an hour, the pick would have been far larger.

Coonoor, Thos. Brown.
29th May, 1899.

GENERAL ARTICLES.

THE NEW SEASON FOR CHINA TEAS.

In the course of a day or two, says the *Grocer* of 6th ultimo, Hankow market opens for the new season's China teas, and it may be confessed, so far as appearances go, it does so under more favourable auspices than have been witnessed within the last decade. Indifferent as the London trade may seem to this event, it is nevertheless one of great importance to parties at a distance, notably Russian and other foreign buyers, who will no doubt attend at the Chinese hongs in larger numbers than usual, and thus help to impart more life to the proceedings there than has been seen for several years past. Although, as we have just remarked, operators here evince little interest in what is going on in Chinese teas, pretending that the dealers do not want them, and that the said teas are only asked for and drunk by epicures, connoisseurs, and the ladies of the aristocracy, yet it must be owned that lately a more than average share of attention has been given them by the blenders, who have been sticklers for "price" tea of common quality suitable for their special purpose, when there has been an unexpected and prolonged dearth of Indian and Ceylon descriptions of the lower class.

This is a fact which should not be lost sight of when forecasting the probable future course of the tea market in general, for in times of scarcity all nice distinctions of quality and degrees of preference are silently dropped, and fanciful pickings and choosings for favourite growths have to make room for rough and ready purchases of whatever ill assorted teas may chance to be on offer. It is very well to say, as we have often heard it said recently, that many of the leading wholesale men will not touch China tea, while there is any Ceylon or Indian leaf to be had instead, and even then it must always be 1d. per pound under the lowest grades of British-grown teas. But circumstances, fresh in the recollection of the trade, have somewhat exploded this idea, as is proved by the revival of demand that has been experienced for China tea at a certain figure, accompanied, as it has been, by a considerable advance in values during the last few weeks, whilst the whole tendency of the London market is, if anything, still towards higher rates. The severely reduced stock in London, whittled down to 71,129,450 lbs., in contrast with 83,251,100 lbs. on May 1, 1898, is sufficient proof of the poverty of the present situation in respect of not having at hand an adequate and immediate supply of suitable teas for home consumption; and it can hardly be doubted that, when the new Monings arrive about the end of June, they will come upon, what is significantly called, a "hungry market."

Not only here, but also abroad, and more especially at Hankow, the Russians and Americans will be strong competitors for the new season's gatherings, and it is expected that they will pay such high prices to secure enough tea to fulfil their orders that the merchants from other markets will be completely shut out from their barg since many English firms will be unable to enter into engagements on equal terms. The existence of so formidable a rivalry in the making of contracts on home trade account will entail upon merchants a twofold disadvantage this season, if they are not careful how they operate. First, to make sure of obtaining the requisite quantity of tea for despatch by the steamer that departs at the earliest date from Hankow for the Thames, they may be tempted to give higher rates than the case actually warrants; secondly, having gone thus far in their speculations, the representatives of London houses and their agents, when the time arrives for the same teas to be realised in this market, may find, much to their surprise and dismay, that the prices paid in Mincing-lane are not exactly equivalent to those that have been sanctioned at the port of shipment. It therefore behoves buyers in foreign markets not to rush in and commit themselves to heavy engagements at "top" prices, but to exercise due caution in their dealings, for the same reverses are not unlikely to occur in the future that have happened in the past, and it is possible that China merchants who have bought too largely of high-priced tea, may not have the good fortune of seeing all their money back again and something over.

MARKETS FOR INDIAN TEA.

PERSIA, ARABIA, TURKEY AND EGYPT.

Writing to the *I. P. G.*, Messrs. W. S. Cresswell & Co., Tea brokers, Calcutta, say:—

"In December last, we wrote to the British Consuls in Persia, Arabia, Turkey and Egypt, to enquire into the state of the tea trade there, thinking that the replies would be interesting to merchants and planters in this country. We enclose what replies we have received, which will show you that there is still room for furthering the consumption of Indian teas outside Europe. 42 per cent. of the teas sold in Calcutta are taken for ports outside Great Britain. Only 6½ per cent. of the Indian teas sold in Mincing-Lane are taken for outside markets. With another 200,000 chests sold in Calcutta, the outside markets would develop considerably more than hitherto, and instead of only 42 per cent. being taken, the consumption would be nearer 60 per cent. and the London market greatly eased by the supply being brought nearer the demand. Unless something be done to regulate these supplies, we shall soon go back to the old fancy price of 4½d. for common kinds. The position at present is a very strong one, *why not make an effort to keep it so?*"

The following are extracts from the letters referred to:—

The Acting British Consul-General, Bagdad, writes under date 23rd January 1899, that it may be said that the average quantity passing annually through the Bagdad Custom House during the past three or four years has been nearly 5,000 cases of, say, 100 lbs. each, say, 500,000. Some 80 to 90 per cent. of this tea goes to supply the markets of North-West Persia. The great bulk of the tea imported is Indian, and is known in the trade as "Calcutta" tea; only a small quantity (perhaps 5 per cent.) comes from China and Java.

Of this annual import of some 5,000 cases, about 750 cases are sufficient to supply the wants of Turkish Arabia, of which Bagdad is the emporium. The present wholesale price of the description of "Calcutta" tea most freely sold in Bagdad is about Grand Seigneur Piastres 11¼ per Constantinople oke (2·83lbs.) equal at exchange of G. S. Piastres 115 per pound sterling on London to about 8¼d. per lb.

The trade is at present worked very cheaply by native merchants having agents in India. It seems to be increasing, but there would appear to be no room for a sudden development in this particular trade. It is *possible* that, with the present low prices of Indian teas, there may be a gradual change in the habits of the people of Turkish Arabia, that is, they may, after a time, come to drink more tea and less coffee. At the same time lower prices nearly always mean larger consumption, and, if the trade in Calcutta can put a tea on the Bagdad market at a less price than that quoted, the trade will probably expand. The market here requires cheapness before quality.

On tea sold for consumption in Turkish Arabia the duty is 8 per cent. *ad valorem.* If, however, it is sold for export direct into Persia, the duty is a transit one of 1 per cent. only. In the latter case, of course, the price paid here by merchants buying from the importers for the Persian market is proportionately less, *e.g.*, as against piastres 11¼, quoted above, the quotation, if selling for Persia, would be about piastres 10½.

The British Consul at Smyrna, writes under date 14th January 1899:—

In 1897 about 168,500 lbs. of tea were imported at Smyrna, estimated value about £10,900, for local consumption. It was chiefly blended tea, *i.e.*, China and Indian teas mixed. Natives of this country do not drink much tea, coffee being the beverage consumed instead. *The demand for tea is, however, increasing every year.* Price paid is from 2s 6d. to 3s. (retail) per lb.

There is decidedly room for a further development in this trade. The import duty on tea is 8 per cent. *ad valorem.*

The British Consul-General, Tripoli, writes under date 15th January 1899:—

The import of tea averages between £4,000 and £5,000 a year the bulk of which is purchased here for export to the Soudan by the trade caravans proceeding south to Wadai, Kano, Sokoto, etc. The qualities are as follows:—

Pon Mec	...	½ chests 0 3 10 at France 2 10 per kilo.	
Ditto	...	...	1 90 „
Young Hyson	...	...	1 70 „
Ditto	...	...	2 0 „

Small quantity of Indian tea in chests of 1 0 4 at 1s. 4d. to 2s. per lb. (all sales at 4 months date).

The caravan trade being on the decline, I do not think there is room for further development. The local consumption is small; the import duty is 8 per cent. *ad valorem.*

The Consular Assistant, Salonica, under date 16th January 1899, says:—

The importation of tea, mainly of India origin, amounts to 200 or 300 original cases in the season. The greater part of this is for consumption here and some for other parts of the province.

The use of tea is not general among the population, but appears to be extending with fair rapidity.

The import duty is 8 per cent as on all goods admitted into Turkey, and the price is from 2s. 3d. to 2s. 10d. per lb. according to quality.

The Vice-Consul, Uscub, Turkey-in-Europe, writes under date 22nd January 1889:—

The annual consumption in this Vilayet (Kossova) is about 1,500 okes (an oke is 2⅘ lbs) Except for a small quantity of Russian tea, nearly all the tea consumed comes from Asia Minor. It arrives at Constantinople or Salonica in cases of 50 kilogrammes each. In those towns it is repacked in tins of 1 oke, ½ oke, ¼ oke and sent to Uscub. The price at Constantinople or Salonica of the tea in general consumption here is 30 piastres the oke (110 piastres—£1) and it is sold here at 50 piastres the oke. The Russian tea is sold in packets of 100 grammes at 5 piastres the packet. I should say that probably the tea consumed here and said to be from Asia Minor is the same as you speak of as sold to Persian Gulf or Trebizonde merchants.

The Vice-Consul, Van, Turkey-in-Asia, writes under date 22nd January 1899:—

All tea imported here comes from Constantinople merchants. It is said that these merchants import in large cases from India, but the tea is remixed and packed at Constantinople before forwarding into the interior.

It is packed in small fancy tin boxes containing from 25 dirhems to 3 okes each box. (400 dirhems—1 oke =2¾ lbs.) Inferior teas are in small canisters 4 to 6 inches high. Occasionally rectangular tin boxes 13 by 9 by 10 inches are used.

It must be remembered that all goods to this province must come by pack transport chiefly from Trebizonde, sometimes from Alexandria. It might be possible, however, to open a more direct trade with Van through Bagdad and Mosul; the caravan distance from Bagdad and Constantinople is about the same.

Since ten years ago people, both rich and poor, have begun to drink more tea, and until three years ago the trade was increasing. The disturbances three years ago have much impoverished the country and there is no money to buy much besides bread and the absolute necessaries of life. This year there are fears of a partial famine. The import last year to Van was 3,000 okes or 8,250 lbs. The import duties are all paid in Constantinople. There are none here.

There are three kinds of tea imported here—

(1)	80 piastres an oke	...	...	6 shillings a lb.
(2)	40 „	...	...	3 „ „
(3)	20 „	...	...	1s. 6d. „

Samples of each are enclosed in the sample box.

As far as I can judge, all these have but a very remote connection with the actual tea plant.

Tea is not usually sold by the oke, but in the fancy boxes such as the one I send, which, filled with the second quality, is sold for 12 paistres or 2s. 6d. A canister 2½ feet diameter and 3⅛ feet high full of the worst quality is sold for 3½ piastres or 8¾d. A canister 4 feet high and diameter of second quality is sold for 5 piastres or 1s. 0½d. If the condition of the country should improve *I should think there would be a good demand for tea here.*

The Bagdad, Mosul-Van route would be the best, as the middlemen in Constantinople would be saved. A central agency at Bagdad with sub-agents at Mosul, Bitlis-Van and Diarbekr ought to do a good trade in cheap tea of a good quality.

The Consul at Beirut, writing on 25th January 1899, said:—

6,000 okes—15,000 chests tea passes annually through Beirut. Destination—Beirut, Damascus, Jaffa, and Jerusalem receive an equal quantity. Tea is not a national beverage, foreign residents consume the most. The quantity imported is drunk. Indian teas, price 7d. to 9d. per lbs. China teas 4 to 7 per 3 lbs. packets. China

teas packed in 10 or 20 lb. chests. Indian teas in 20 to 80 lbs chests. The import duty is 8 per cent. *ad valorem*. There is little chance of developing the trade.

The Consul at Angora, Turkey, said on 27th January 1899:—

No tea passes through the province of Angora, such as is imported being used in the district itself. The tea, I am informed, is of Chinese origin and comes through Russia to Constantinople, from which town it is imported here by rail directly. The annual consumption of tea in Angora and district is estimated to amount to 2,500 okes (the oke being taken at 2¾lbs.) of a value of some £500, which would give an average price of 4s. an oke or about 1s. 5d. per lb.

As you will see by the above figures, Angora can hardly be said to contain a tea-drinking population. Nevertheless I am told that, during the last three or four years, there have been signs *that the article has been gradually gaining ground, and that the families who formerly drank nothing but coffee are now replacing it by tea.* The same, though to a less degree, may be said of the Turkish peasants, among whom the custom has been introduced by immigrant Circassians from the Caucasus. The import duty on goods entering the Ottoman Empire is 8 per cent *ad valorem*. There is no octroi at Angora.

The British Consul at Damascus writes on 30th January 1899:—

About 100 boxes of Indian tea are consumed yearly in Damascus and district, each box containing from 110 lbs. to 132 lbs. Of China tea the yearly consumption is so small that it is hardly worth mentioning, perhaps 2 or 3 boxes similar in size to those in which Indian tea is imported. The habit of tea drinking is *undoubtedly growing in this city* and the few towns, which are comprised within the limits of the province, but as the greater part of it (the province) is inhabited by Bedouins, Druses, Circassians, and other wild and semi-civilized races to the great majority of whom tea is a novelty as well as a luxury, its consumption is necessarily very restricted.

The further development of the trade is not likely, considering the rough and uncivilized character of the majority of the inhabitants, to be either rapid or extensive. On the other hand, it is undeniable that such consumption of tea as exists has made very rapid strides *in the towns* of late years. Moreover, thanks to British enterprise and capital, a Railway is now in the course of construction which will connect St. Jean d'Arc, Haifa and Damascus, and so tap a considerable tract of country which no railway has hitherto reached, so that the demand for luxuries, such as tea so considered in this country, *will undoubtedly increase in the future.* On the other hand, it should be remembered that coffee, though it is dearer than tea, is *the* beverage of the country, while the latter is not. And even those who are most accustomed to the drinking of tea only indulge in the habit during the winter or cold months: all through the summer and the early autumn they drink coffee as being, so it is held, less heating. Nevertheless the habit of tea drinking is *certainly growing*, though chiefly confined at present to the towns.

The Consul at Jerusalem, writes on 11th February 1899:—

The tea imported into Palestine is, for the most part, of an inferior quality, and is consumed by the Jewish population and Russian pilgrims. The consumption, however, of tea in this country is *on the increase*, the natives having of late years taken to tea drinking, but as a rule they are indifferent to the quality. The price generally paid for the ordinary kind is at the rate of 1s. to 1s. 3d. per pound retail, sold in ¼lb. packets and it is a blend of China and Indian tea (sample No. (1).

The Europeans and better class of the inhabitants consume generally Ceylon tea or Orange Pekoe which are retailed at 1s. 6d. to 2s. 6d. per pound and is sold in bulk and in 1 lb. packets (sample No. (2).

From Kharput comes the news that the amount of tea used in the province during the year is about 2,000 okes (the oke being nearly equal to 2¾ lbs. distributed as follows:—

Kharput and the neighbourhood ...	700	okes.
Malatia district	700	„
Arabhia	500	„
Egin	100	„

As regards the country of origin of the tea imported into this province, about 75 per cent. is Chinese tea the remaining 25 per cent. being Indian of better quality than the China tea and higher in price. The quality of the tea used is for the most part very inferior, only about 10 per cent. being fairly good. The import is obtained entirely from Constantinople, there being no direct trade with China or India.

There is but little hope of any great expansion of the tr taking place at an early date.

The British Vice-Consul at Mohammerah, Persia, writes u date 24th February 1899:—

The import of *tea is increasing and is likely to increase.* The is Indian, Ceylon, China and Japan and is shipped by Brit steamer from Bombay.

The imports for the past three years were as follows:—

Year	Landed at Mohammerah.	Re-shipped to Karun.	Transhipped India to Karun Ports.
	Cwt.	Cwt.	Cwt.
1896	191½	65	301
1897	191	133½	240
1898	388½	82⅓	797½

The second column should be deducted from first to show lo consumption.

The following varieties are sold in Mohammerah Bazar at re price given:—

[*Exchange*—Krans 35 = Rs.10.]

1. Java tea, 200 tins of about a pound, at Krans 150.
2. Calcutta tea, Krans 10 per 6 lbs.
3. Ceylon tea, Krans 11 per 6 lbs.
4. White China tea (Pekoe) Krans 14 per 5 lbs.
5. Khaldar (Java Pekoe) Krans 14 per 5 lbs. tin, or Krans per 1 lb. tin.

Indian and Ceylon is either loose or in packets, packed in ca of 100 lbs. and 200 lbs. Paper packets generally bear a label Persian giving the name of some Persian trader either in India here.

Samples are enclosed of above.

Import dues of tea, if owned by Europeans, 5 per cent. *ad valo* once and for all.

Tea imported by Persians pay no customs at Mohammerah, an octroi of Krs. 0·025 per lb. package, with other charges incl ing literage coming to about seven krans per case. If re-shippe pays customs on shipment and at other places in the interior.

Through native cargo pays customs at Shushter Krans 12·75 mule load of 2 large or 4 small cases, it is liable to further dues other places beyond Shushter.

The British India and the Bombay and the Persia Steam Navi tion Companies issue through Bombay B L from Bombay to Na and Shushter on the Karun.

A mule road from Nasri (Ahuaz) to Ispahan is now being c structed and will probably lead to further trade with the inter by the Karun route.

The British Consul at Ispahan, Persia, writes on 25th Febru 1899:—

I do not believe that there is much chance of increasing the trade of the place, it is entirely in the hands of Parsi merchan who have their agencies in Bombay, who work it, you may be su for all that it is worth. I see by referring to my report of 1 No. 1662, Circular report, that, during the year 1895-96, the impor tion was 2,800,000 lbs., whereas in 1891-92 6,000,000 (six millions) w the figure. The closing of the Russian markets in the north w the cause of this great decrease.

With regard to this market in

1892-93 ...	4,844	boxes were imported.
1894-95 ...	4,479	„ „
1896-97 ...	3,117	„ „
1897-98 ...	6,314	„ „

The major portion of this tea is Indian, about $\frac{1}{10}$ may be taken China, that is, the tea which finds most favour with the Ul Small consignments also come from Java from time to time. T supplies which come here are for the local market and the surrou ing districts. I cannot find that any goes north. There is very much tea drunk, the people are poor and cannot affor expend much on what to them is a luxury.

Indian tea costs from Krans 32 to 40 per manshah.
China tea „ „ 70 to 110 „
Krans 3·50 = one rupee, 52 krans = £1 and 12·60 lbs. = manshah.
China tea is packed in big boxes, each containing 4 small boxes eighing about 28 lbs.
Indian tea is packed in boxes in lead foil, each containing about 00 lbs. I have seen it also in 1lb. packages. This came from angra Valley. Also I have seen it in wood boxes, each box ontaining four tins of 10 lbs. of tea. These have come from alcutta.
There is an import tax of 5 per cent. on all tea brought in by uropeans. I do not think that there is room for any development the trade. European merchants here, who have connections with ndia, have tried the market and have not found it responsive.
The British Consul at Erzeroum, Turkey, writes on 4th March 899 :—
Tea can be sold here for about £5,000 to 6,000 per year in rzeroum only. But as there is ground to sell also tea for the north Persia, for this year tea will be consumed for £10,000. Either r our city or for Persia Indian teas are used; but a little quantity China white tea.
The people of our province *drink much tea*, and from year to year ie consumption is growing.
Note that all the teas for this country must be flowery (fair ppearance). Black teas are never wanted here.
As for all goods the tax on tea is 8 per cent., which I pay at rebizonde. But if in transit for Persia no tax to pay in Turkey.
In Persia the tax on tea is about 5 per cent.

MANURING OF TROPICAL PLANTS—COFFEE.

Deep loamy soils, rich in humus, are best suited for the culti- ation of coffee; alluvial soils mixed with humus, or sandy loam ils, rich in humus, might also prove suitable, but soils which are ther light and sandy, heavy clay, or deficient in lime. should rtainly be avoided. As the results of experiments made upon is plant indicate that even the most extensive application of tificial fertilisers does not compensate for a deficiency in humus, should be the constant aim of the planter to supply coffee-fields ith humus-producing substances. The very first place should, erefore, be given to fertilisation with stable manure and compost, when these methods cannot be resorted to, they might be re- aced by green manuring. The necessary quantities of nitrogen, osphoric acid, and potash (and sometimes also of lime and mag- sia) must be supplied in the form of mineral fertilisers, as anuring with humus-producing substances alone does not answer e plant-food requirements of the coffee plant. The application mineral fertilisers becomes absolutely necessary whenever a soil s been under cultivation for some time and its natural supply of ant-food has become depleted.
The plant-food requirements of the coffee plant have been oroughly investigated by Dr. F. Dafert, Director do Instituto gronomico do Estado de Sao Paulo, Campinas. As a result of his tensive studies, he compiled the following figures, giving the ant-food requirements of the average coffee-tree upon an average il :—

	Lime.	Magnesia.	Phosphoric Acid.	Potash.	Nitro.
the 1st year	0·057	0·019	0·119	0·013	0·215
„ 2nd „	0·253	0·089	0·433	0·120	0·271
„ 3rd „	3·434	1·150	6·292	0·653	6·345
„ 4th „	5·030	1·574	9·805	1·041	10·674
„ 6th „	12·425	3·910	21·673	2·390	18·106
„ 10th „	11·268	3·619	16·011	1·778	18·066
„ 40th „	4·138	1·283	6·056	0 663	5·538

The roots, stems, and branches were carefully weighed, and the lowing quantities of coffee beans used as a basis for the yields:—

4	year-old tree	... ...	3·5274 oz.
6	„ „	... ...	17·6370 „
10	„ „	... ...	35·2740 „
40	„ „	... ...	7·0548 „

When we consider, however, the fact that in tolerably-well-cared- gardens an abundant use of fertilisers results in a correspond- ly increased yield, requiring proportionately larger quantities plant-food for the formation of wood and leaf, it becomes evident at the actual plant-food requirements of this plant are considerably eater. Dr. Dafert therefore recommends the following quantities of plant-food to be applied to each tree per annum:—

	Phosphoric Acid.	Potash.	Nitrogen.
Trees 0—4 years old ...	0·040 oz.	0·378	0·158
„ 5—8 „ ...	0·313 „	1·231	0·571
„ 9—20 „ ..	0·252 „	0·734	0·462
„ over 20 „ ...	0·152 „	0·488	0·081

In this way the formation of wood and leaf necessary for the rapid development of the tree is promoted, in the first few years, by extensive nitrogen and potash fertilisation, and later on the fruit is aided in its formation and development by larger quanti- ties of phosphoric acid and potash. It is therefore apparent that the principles laid down for other fruit-bearing trees (apples, pears, oranges, lemons, &c.), apply also to coffee.
As a complete absorption of the plant-food ingredients contained in the fertiliser cannot be expected, it is absolutely essential that the quantities applied should be increased in proportion to the nature and condition of the soil.
Fertilising experiments with coffee plants are either so numerous nor satisfactory as to enable us to draw correct conclusions regard- ing the various questions involved in the proper fertilisation of the plant.
Several years ago, Dr. Dafert inaugurated some strictly scientific experiments; they are not yet far enough advanced, however, to show the effect of the various plant-food ingredients upon the yield, although striking differences in the development of the young plants can be recognised at this early date.
1. The presence of humus-forming substances (stable-manure, com- post, coffee-shells, &c.) produces a beneficial effect, although, when used in combination with artificial fertilisers, their availability becomes considerably increased, in proportion as the soil itself is deficient in humus.
2. The application of mineral plant-food ingredients produces a better effect upon soils rich in humus than upon those deficient in this substance.
3. The application of natural fertilisers gave the best results upon soils rich in humus; in this case the addition of artificial ferti- lisers had no effect. It should be mentioned, however, that potash and phosphoric acid always produce a beneficial effect upon the development of fruit.
Dr. Dafert makes the following suggestions (regarding the fer- tilisation of older, *i.e.*, bearing trees), which are based upon numer- ous observations :—
1. Caution should be exerised in fertilising coffee with pure lime or magnesia, as the presence of these substances in large quan- tities will injure the growth. The maximum application has not yet been definitely ascertained.
2. It has been shown conclusively that, in order to grow coffee to the best advantage, it is best to apply the easily soluble fertili- sers, especially the potash salts, at different times and in small doses, as the application of a large quantity at one time is not good for this plant.
3. Organic fertilisers, not thoroughly decomposed, are apt to in- jure the plant. The greatest caution in this respect should be ex- erised in the use of animal substances, though the effect produced by vegetable substances also varies in proportion to the stage of decomposition.
4. Sickly trees must be made accustomed to easily soluble, strong fertilisers gradually, *i.e.*, it is advisable to begin with very small doses which should be gradually increased. (This is recommended by Dr. P. Wagner for garden-plants and fruit-trees.)
5. One-sided fertilisation, *i.e*, the application of only one ingre- dient (a very popular method with many planters) has seldom been of practical benefit. The application of nitrate of soda, for instance, always brought about a luxurious development of the plant, but the formation of fruit suffered. It is advisable there- fore not to overlook the necessity of the simultaneous application of all the plant-food ingredients.
6. No results are at hand regarding the question as to whether it is better to apply sulphates or chlorides, nitrate of soda, or sul- phate of ammonia.
To the question what kind of fertilisers should be applied, Dr. Dafert gives the following answer :—
Natural especially organic, fertilisers produced upon the farm (the quantities of which should be systematically increased, wherever possible) and in addition artificial fertilisers, should be applied to coffee. Where diversified farming (with dairying) is absolutely impracticable, green manuring can be resorted to.

The slowly soluble artificial fertilisers, such as Thomas' slag, guano, bonemeal, &c., should be applied to rich soils, and especially where it is desired to supply the soil for several years. Easily soluble materials, such as acid phosphate, nitrate of soda, sulphate of ammonia, and all of the potash salts, should, on the other hand, be applied when

(1) it is desired to produce a rapid improvement in exhausted or weakened plantations, and to raise them to a state of the highest productiveness;
(2) coffee is to be cultivated on very poor but otherwise well situated soils;
(3) it is desirable to correct some errors, as, for instance, deficiency of nitrogen in the case of poor sprouts, or deficiency of potash in case of insufficient fertility;
(4) it is desired to counteract slight defects in climate (cool location).

Dr. Dafert, in this connection, gives the following directions for the proper fertilisation of the coffee plant, in which an annual application of from 2·2 to 8·8 lbs. of stable manure or compost to each tree is taken as a basis :—

For Trees in the first 4 Years of growth.	For Trees from 5—8 Years old.	For Trees from 9—20 Years old.	For older Trees.
A.—Easily Soluble Mixtures.			
4·5 lb. double superphosphate (40 per cent.)	11·1 lb. double superphosphate.	14·3 lb. double superphosphate.	21·5 lb. double superphosphate.
3·3 ,, muriate of potash.	34·9 ,, nitrate of potash.	33·3 ,, muriate of potash.	55·4 ,, muriate of potash.
4·8 ,, nitrate of soda.	54·0 ,, nitrate of soda.	52·4 ,, sulphate of ammonia.	23·1 ,, sulphate of ammonia.
1·3 ,, plaster.			
Each tree should receive per annum 8·8 ounces.	*28·2 ounces.*	*17·6 ounces.*	*7·1 ounces.*
B.—Slowly Available Mixtures.			
1.—Utilisation of the Coffee-shell Ashes.			
58 lb. dried blood.	56·9 lb. dried blood.	60·8 lb. dried blood.	24·4 lb. dried blood.
2 ,, Thomas' slag.	30·7 ,, coffee-shell ashes.	9·1 ,, Thomas' slag.	15·4 ,, Thomas' slag.
31 ,, coffee-shell ashes.	2·0 ,, bonemeal.	24·9 ,, coffee-shell ashes.	48·0 ,, coffee-shell ashes.
9 ,, plaster.	10·4 ,, Thomas' slag.	5·2 ,, bonemeal.	12·2 ,, bonemeal.
Each tree should receive per annum 24·7 ounces.	*15·9 ounces.*	*12·3 ounces.*	*3·5 ounces.*
2.—Utilisation of Oilcakes.			
56 lb. castor cakes.	45·9 lb. castor cakes.	51·8 lb. castor cakes.	29·1 lb. castor cakes.
30 ,, dried blood.	25·0 ,, dried blood.	23·5 ,, dried blood.	12·9 ,, dried blood.
3 ,, Thomas' slag.	10·3 ,, Thomas' slag.	10·6 ,, Thomas' slag.	26·4 ,, Thomas' slag.
5 ,, muriate of potash	18·8 ,, muriate of potash.	14·1 ,, muriate of potash.	31·6 ,, muriate of potash.
6 ,, plaster.			
Each tree should receive per annum 35·3 ounces.	*22·9 ounces.*	*17·6 ounces.*	*5·3 ounces.*

Dr. Dafert remarks :—

1. In case it is desirable to replace one or the other of these materials by some equivalent substance, the tables of composition in Part I should be referred to.

2. Where stable-manure, compost, &c., are not available, an increased artificial fertilisation must be resorted to. Either the application of the easily soluble mixtures must be doubled, or they may be used in combination with more slowly available mixtures; in the latter case, Thomas' slag especially should be taken consideration.

3. When the condition of the soil is abnormal, the above form must be altered. For instance, it is wasteful to apply plaste calcareous soils; soils rich in potash require a much smaller q tity of this ingredient than that recommended above. If the is deficient in phosphoric acid, the percentage of this ingredien the mixtures must be increased.

4. The age limits given in the table should be changed to varying conditions, the figures being mean values and inter for average trees.

SUCCESS OF PROPER COFFEE FERTILISATION.

Though the number of reliable observations regarding the e of the applications recommended above is not large, the exam given below will convey an approximate idea of what ca accomplished by means of a rational cultivation of the coffee p

In 1893 the Agricultural Institute of the State of Sao P assumed the management of an almost abandoned sixteen-yea plantation, the returns from which scarcely covered the cos harvesting. This field was of special interest to the institut many million coffee-trees in Brazil are in a similar, if not po condition. The plantation was first carefully cleared, and its y determined. They yield from 5,512 trees in 1893-94 was :—

1,426·57 gallons coffee = 1,786·8 lb. bean-coffee,
or per tree 1·04 quarts ,, = 0·33 ,, ,,

Immediately after harvesting, the poorer trees were fertil with half of the quantities given in the table, and the soil thorou cultivated. At the end of three months, the soil had impr considerably, the blossoms were especially numerous on the fe lised trees, and the development of fruit was normal.

These 5,512 trees yielded in 1894-95 :—

7,483·36 gallons coffee = 9,911·9 lb. bean-coffee,
or per tree 5·39 quarts ,, = 1·79 ,, ,,

In 1893-94 the average value of the yield from each tree wa pf. The expenses amounted to somewhat over 43 pf., and the was therefore 18 pf.

In 1894-95 the value of the yield from each tree was 134 while the total expenses did not amount to more than 44 pf., every tree produced a profit of 90 pf. The fertiliser applied to tree was worth 16 pf.

This is only the beginning, and, judging from the pre favourable condition of the plantation, the next yield will b least double that of the previous year.

Dr. James Warne, of Itapira, Brazil, inaugurated a more inten system upon his farm ten years ago, and procured 82.672 5 lb about 7·7 lb. of bean-coffee per tree, from 15,000 partly (two-thi very old trees, by means of fertilisation with stable-manure.

During the last few years, artificial fertilisers have been lar used, although not to the exclusion of other manures; the mixt were similar to those used in Campinas, but the percentag nitrogen was higher. The average yield per tree was 5·9 Some of the trees to which stable-manure had been applied, as as others which had received both stable-manure and artificial fe lisers, produced 26·5 lb., some of the latter producing even as m 33 lb.

Mr. G. J. Hockmeyer obtained very good results upon plantation, Las Mercedes, in Guatemala, with a mixture of :—

47·4 per cent. nitrate of soda,
31·6 per cent. sulphate of potash, and
21·0 per cent. double superphosphate.

No exact figures regarding the yield are given.

Mr. A. Brunner, Helyana Landen (Sumatra) reports that w coffee-seedlings had been artificially fertilised they could transplanted at the end of six months (with one or two branch as a rule, this is not possible until a year has elapsed.

As regards the manner of applying the fertiliser materials, l need be said.

In laying out new plantations, it is best to mix the fertilisers earth in the holes, which must be deepened and enlarged ac ingly. In the case of older trees, the fertilisers should be ap as far as the roots may extend, and turned under. In orde ensure the best distribution of the materials, they should firs mixed with earth; the proper quantities of this mixture inte for one tree should then be measured off in some vessel (old tin will answer the purpose).

Broadcasting over the field is injudicious, as it would neces the application of much larger quantites.—*Queensland Agric Journal.*

TEA, &c., COMPANIES.

The Lebong Tea Co., Ld.—Average price 11·51d., against 11 92d. 1897. Profit £4,803-2-2. Interim dividend of 6s. paid, final dividend 10s, making 10% for the year.

Darjeeling Consolidated Tea Co., Ld.—Gross profits £2,090-10-7. Average price 10·46d., against 10·22d. in 1897.

New Sylhet Tea Estates Co., Ld.—Outturn 372,235 lbs., average price 6·62d., against 6·90d. in 1897.

Killcott Tea Co., Ld.—Outturn 2,185 maunds, average slightly over 5 as. 6 p. Profit Rs.1,679-10-6.

Dehra Doon Tea Co.—Profit Rs.15,952-4-1. Outturn 429,275 lbs. A dividend of 3% recommended.

Garikhota Tea Co., Ld.—Crop 5,400 maunds, average 7¾d. Profit £9,003-4-8. Crop of tea 708,500 lbs. made from bought leaf 906,247 lbs. Crop of Cocoa, 185 cwt., Coffee 375 cwt., and Cinchona 7,963 lbs. Profit £3,773-19-7. Interim dividend 1½% paid in November last, a final dividend of 2% acommended, making 3½ % for the year.

PANAMA RUBBER (CASTILLOA).

CIRCULAR ISSUED FROM THE ROYAL BOTANIC GARDENS., CEYLON.

In circular No. 4 of this Series the cultivation of Para rubber is dealt with somewhat fully. It was pointed out that there is not very much suitable land in the Colony on which this cultivation was likely to prove really successful. The growth, cultivation, and yield of trees were considered, and a prospect of a moderately remunerative return in favourable places for the cultivation was shown to exist. Since the time of publication of these statements, however, the question of which rubber tree to plant with the most favourable prospects of profitable return has been considerably altered by the publication of the discovery of a machine for the preparation of rubber from the raw milk of the tree. By the aid of a machine on the principle of the centrifugal cream separator, Mr. Griffen has succeeded in preparing almost pure caoutchouc from the milk (*latex*) which contains it. This is done in a few minutes at a very small cost, and the resulting product is almost free from impurity, and does not decay or smell like the ordinarily-prepared raw rubber. The best rubber hitherto sent into the market contains at least 10 per cent. of impurity, and many kinds contain as much as 30 to 40 per cent. The importance of this discovery is manifest. The chief advantage of Para and Panama rubbers, as at present prepared, is their great freedom from impurity, due largely to the composition of the milks, and partly to the methods of preparation. Under the new conditions, however, this advantage is lost, for the machine will prepare from the poorest and most impure milk a rubber superior to the best Para now on the market. The first question, therefore before the would-be grower of rubber trees is now no longer: "Which tree gives the best result as to quantity and quality combined?" but rather: "Which tree gives the greatest yield of caoutchouc?" The former question had been practically answered for Ceylon in favour of the Para rubber (*Hevea braliensis*). The latter has still to be answered, but there is great probability, if not almost certainty, that it must ultimately be answered in favour of *Castilloa*, and hence the publication of this circular in which it is proposed to deal with the whole question so far as present existing data allow of conclusions. The tree has been so little cultivated in the East that reliable data in sufficient numbers are not to be had, and it is hoped that the publication of this paper will induce those who may have experimented with this tree to communicate the results of their work.

MACHINE METHODS.

Another important bearing of the discovery abovementioned must also be pointed out. At present the best natural rubbers obtain about 4s. per lb. in the London market. When the machine-prepared article first comes upon the market it will doubtless obtain a higher price than this, but this will not long be the case. Inevitably the price of the best machine rubber will fall to about that of the best natural of to-day, while the latter will only fetch perhaps 3s. per lb. and the poorer grades will also fall in price correspondingly. For profitable cultivation, that is, the machine methods must be used. Now, for this purpose it is necessary that the milk be collected in vessels and not allowed to dry on the tree. We have seen in dealing with Para rubber that in Ceylon, at any rate, the milk is very thick, almost like syrup. It quickly coagulates, and in all cases a lot of it dries on the tree. Before the recent discovery this mattered less, for this scrap rubber would sell for 1s. 6d. to 2s. 6d. per lb. Now, however, as we have just seen, this price is likely to fall by 1s. or more. This will materially alter the figures of return given in the last paragraph of the circular referred to. Instead of the average price being 2s. per lb. it is more likely to be 1s. 6d. and this will reduce the yield per acre to Rs.112 say. This reduces the margin of Rs.100 there given to Rs.62, leaving considerable uncertainty as to whether the cultivation is likely to pay at all well enough to be worth attention from European planters, who would probably find the trees yield much better in the Straits or America. *Castilloa* milk flows very much more freely, and does not soon coagulate, so that the same objection does not apply to it. Practically the whole of the milk from a tree can be collected without any difficulty from coagulation beginning in it.

ADVICE TO PLANTERS.

The practical corollary of these remarks, so far as Ceylon is concerned, is this. Para rubber will do fairly well at low elevations in certain districts, though probably at the best it will never do so well as in the Straits Settlements or America. Owing to the introduction of the machine methods, it will in future be necessary to collect the milk in vessels. Now, the Para rubber tree when tapped at a girth of 21 feet, as recommended in the previous circular, does not lend itself to this condition, as much of the rubber dries on the tree. It will thus be necessary for planters either to content themselves with the old process, thus getting a lower average price for their product, or to wait till the trees get to a larger size, say, in fifteen years on the average. It follows from this that private planters here will hardly find it worth while to establish plantations of Para rubber only. Probably the best thing to do will be to plant out the tree among tea or other products at considerable distances apart. The trees will then grow to a larger size in less time than if kept in plantations of rubber only, and their rubber will form a useful minor product. The tree is a handsome tree when well grown apart from others, and might well be used as shade for roads or as an ornamental tree.

Those who intend to make plantations of rubber only would do better to use *Castilloa*, which yields much more fluid and easily-collected milk, but even here no return can be got in much less than eight years. This tree may also be planted out as a bye-product on estates, and will probably be found in the end the more profitable of the two. Ceylon seems an unfavourable country for yield, though highly favourable for growth, of rubber trees. Consequently, only the very best localities should be chosen for planting.

BOTANY.

Castilloa is a genus of the family *Moracæ* (often included in *Urticaceæ*), and belongs to that section of the family which includes the jak and bread fruit (*Artocarpus*), the upas (*Antiaris*), the milk tree (*Brosimum*), and the many plants of the genus *Ficus*, which include among others the Bo and the Assam rubber (*F. elastica*). The genus has two or three species. Of these the most important is *C. elastica*, Cervantes, the Ulè of the Spaniards, which is found wild in Mexico from lat. 21o southwards, in Guatemala, Honduras, San Salvador, Costa Rica, and Nicaragua; it also appears to occur in north-western South America. It grows to a large tree having been measured of 180 feet in height and 15 feet in girth. The growth is rapid. When young the tree grows rapidly upwards, and forms a number of short lateral branches, which after a time drop off, being detached from the trunk by a peculiar joint, whose surface resembles a piece of coral. The bark is rather soft and thick. The leaves are large and oblong. The flowers are borne when the tree has reached some considerable size and has begun to form permanent branches. They are monœcious, male and female on the same branch, enclosed or embedded in a top-like common receptacle, which is covered externally with small leaves This subsequently forms a somewhat fleshy fruit, containing numerous small seeds about ¼ inch in diameter, with white papery seed-coats. Besides this species there is a second, the Caucho of the Spaniards, found near Darien (Panama) and elsewhere. This is the tree which we

have in Ceylon, and it appears probable that it is a different species, *C. Markhamiana*, Markham (not Collins), but the point requires further study. In its native country this forms an important source of rubber It appears to be a smaller tree than the tree *C. elastica*. The details of the description of these species may be found in the paper by Hooker mentioned in the list of literature below.

HISTORY IN CEYLON.

The *Castilloa* rubber was introduced into the colony about the same time as the Para, and through the same agency. A Wardian case of plants arrived in 1876 from the Royal Gardens, Kew, and the plants were put out at Henaratgoda and Peradeniya. They grew well at both places, but especially at Henaratgoda, and were increased by cuttings. They began to flower in 1881, and in the following year a few seeds were ripened. About 1886 the growth became less rapid, and since then has been very slight, the soil in the gardens being shallow, and at Henaratgoda not well drained at a little depth. A large number of young plants were sent to India and many were planted in Ceylon, but, compared with Ceara and Para rubbers. *Castilloa* is very rare in the Colony, and very few estates possess any appreciable number of trees. Samples of rubber prepared here have been sent home for valuation, and have received very favourable reports.

CLIMATE AND SOIL.

The tree ranges, as we have seen over a large tract of country but the conditions for its successful growth seem much the same everywhere It inhabits a warm, steamy climate, like that of the low-country of south-west Ceylon, and is very rarely found above 1,500 feet. The most common situations are in alluvial soil at the sides of valleys or on low ridges. It needs deep soil, with plenty of water but does not thrive where the soil is swampy, nor in places where there is not good drainage at the roots. It is probably partly for this reason that the growth at Henaratgoda, so soon became slow, for the land there is flat and only twenty feet above the level of the sea At Peradeniya it is on better drained land, but the soil is very shallow.

The tree prefers a steamy climate, but will do where this is interrupted by a dry season of two or three months, as in south-west Ceylon. It grows best where the temperature never falls below sixty degrees at any time.

The most promising localities for the cultivation of this tree would probably be found in the neighbourhood of Rambukkana, Kitulgala, Balangoda, and other districts in the foot-hills of the south west, and perhaps also in similar districts of the Bintenne country to the east of the mountain range, and in Lower Madulsima, Passara, Monaragalla, &c. It should be planted in sheltered places near streams, but with good drainage at the foot. To plant above 2,000 feet is not advisable, and it would be better to plant below 1,000 feet. The rainfall should not be below seventy inches, and should be well distributed The tree affects drier localities on the whole than para rubber, and so the two cultivations need not interfere with one another, as the para tree will grow in the wetter places

The tree grows best in a deep, warm, loamy soil. In its native country it is said to send its roots very deeply into the soil, and not to be a surface feeder. In the gardens at Henaratgoda, however, it sends out great roots at the base like the Assam rubber (*Ficus elastica*), growing out to considerable distances along the surface and projecting above it. One root was measured running along the surface for 30 yards, and where it finally became invisible it was three inches in thickness. This phenomenon at Henaratgoda may be largely due to the quality or lack of drainage of the lower soil; but it seems common in other places where the tree is grown in the colony, and will limit its use as a shade tree, for which purpose it has often been recommended in other countries. If used as shade. it would perhaps do better with tea than with most of our other cultivated crops. In better soil and position than what has hitherto been tried, however, it may very likely strike deep roots, in which case other crops could be more easily cultivated between the rubber trees, *e.g.*, plantains or even cacao

CULTIVATION.

The seed should be sown as soon as obtained, in a well-prepared nursery They should be sown an inch deep, and about 8 inches apart, and lightly covered with a little vegetable mould. They must be kept lightly shaded, and watered when the surface of the ground is dry. In ten or twelve months the young plants will be 2 feet high and ready for planting out.

Cuttings may also be taken; those from lateral branches d grow well, and have a tendency to grow more or less horizont so that main shoots must be used. When cut back the main produces buds from the axils of the leaves, and these may in be used as cuttings, and so on. Cuttings should be at least 3 in long, with a basal portion of old wood, and perhaps 12 inch better, as described for the case of para rubber.

The young plants should be planted out during rainy weath prepared places. Holes should be dug and filled with well-pre sandy, loamy soil. If the plantation is to consist of trees of C *loa* only, they may be put at about 12 feet apart, or perhaps b a little closer. If other products are to be cultivated betwee rubber trees the distance must be much greater. The young must be shaded for a time, and probably it would be best if were lightly shaded for two or three years till they reach height of 20 feet or so. This might be effected by planting t for instance, on land already bearing such light shade trees a used for cacao. On parts of estates where the canker has renc it needful to cut out the cacao it might be well worth while t the *Castilloa*. The ground should be kept clear of weeds and trees watered in dry weather of long duration, until they r sufficient size to take care of themselves.

RATE OF GROWTH.

The tree grows fairly rapidly at first, and soon reaches a h of 10 or more feet. From the annual Administration Report this Department the following extracts have been made reference to this subject: In 1878 the original trees were two old, from time of planting out as cuttings; some were 16 feet h and 16 inches round the base of the trunk. In 1880 the lar tree at Henaratgoda was 17 inches in girth at a yard above the In 1882 the largest tree there was 46 feet high, and 26 inches r at a yard above the soil. In 1884 its girth was 32½ inches; in 38 inches; and it began to show signs of less rapid growth, so it only reached 40½ inches in 1888, 42½ in 1890, and 43¼ in Up to about the tenth year, therefore, at any rate, the tree apparently be counted upon to grow well; and even though subsequent growth is slow, the yield of rubber seems to inc considerably. After reaching a girth of about 2 feet or 2 f inches, the trees may probably be tapped for milk. Comparing above measurements with those given in the circular on para ru it will be seen that *Castilloa* is distinctly slower in growth of two and probably a plantation of para rubber would reach girth of 2 feet (average) in two years' less time than one of *Cast*

TAPPING.

The tree should not be tapped till it reaches a girth of at le feet. This should be attained in a period of perhaps nine yea the average, and it would be better to wait for two years mo possible till a girth of perhaps 2 ft. 6 in. is reached. After eighth year there would probably be a fair number of trees in plantation ready for tapping, and of course the number w increase every year till all were sufficiently large for the purp

The milk of this tree flows much more freely than that of *H* so that one cut seems to drain a much larger area of the ste its milk. The native methods of tapping are mostly very wast and also often cause the death of the trees. Sometimes the me described under Para rubber, by cutting V-incisions at freq intervals, is used, and so far this seems to have been the only used in Ceylon. We have found that the milk here runs so fr that a simple sloping cut is sufficient, and that there is no ne make the V. If this method is used, the cuts need not be so c together as in *Hevea*; they may be 3 or 4 feet apart instead Sometimes the whole tree is cut down and incisions made in bark as it lies on the ground. Other methods are to cut sp groves round the tree for some distance up, or to make a r channel on one side of the stem with lateral cuts leading int These methods are almost sure to kill the tree, at any rate af few years, and only the first-mentioned—the method of sl incision—should be used with cultivated trees.

Further details of methods will be given in succeeding circu of this series. The general principle recommended is to at four or five tin cups at distances of a few feet apart up the Single oblique incisions are made, one above each cup, and milk is collected and washed into a vessel with a tap at the bot Probably the best machine would be a glass churn with tap at b fixed so as to revolve about a horizontal axis. The milk is le stand, when it separates into a cream containing all the ru

nd a beery fluid below, which is run off by the tap. The cream is ixed with water. churned, left to stand, and the process repeated. he rubber is thus obtained almost pure in three washings, and he cream is poured out to dry on a porous surface, when a thin heet of perfectly dry and almost pure caoutchouc is obtained in a hort time.

YIELD.

Till further experience has been gained we do not know how uch tapping is advisable in *Castilloa*, nor how much it will stand. he trees in the island, so far as tested, yield very well, but it would e premature to draw any general conclusions. A few trees of about hree feet girth gave an average of five ounces of rubber each from ne day's tapping. Probably three or four tappings might be done very year without serious injury, but this remains to be investiated. The amount of rubber is not much larger than in Para rees of similar age, but it was collected from a quarter of the umber of incisions, thus very much reducing the cost of its collecon. It must also be remembered that this rubber was perfectly ry, whereas the driest rubber prepared by the old methods conained 10 per cent. or more of water.

The cost of opening plantations of rubber will be found in the receding circular. The probable return in the case of *Castilloa* is rger than in the case of Para, and its cost of collection is less, so at the cultivation of this plant as a bye-product in favourable calities may be recommended to planters. Neither kind of rubber n be safely recommended as a principal product. Those who ish to plant it on a large scale would probably do better in ountries further east.

LITERATURE.

The following books and papers, among others, relating to *astilloa*, may be consulted in the library at Peradeniya. The itials and figures indicate their place in the library :—

Director, Royal Botanic Gardens.
Peradeniya, April 7th, 1899.

ELECTRICITY AND AGRICULTURE.

Science, as applied to the operations of agriculture, has, for many ars, engaged the attention of enthusiastic experimentalists, and, many cases, the results of applied science have been little short marvellous. The idea of the application of electricity to grow-g crops is not by any means new. We have ourselves achieved od results by using it in connection with a crop of potatoes. *The lifornia Fruit Grower*, writing on the subject, says :—

Perhaps the most extensive and conclusive experiments on the lation of electricity to plants growing were those of Dr. Selim mstrom, a physicist in the University of Helsingfors, Finland. e became convinced that the rapid growth of plants in the short mmer months of Finland and Spitzbergen was due to the highly ctrified atmosphere. Laboratory experiments were so successful at in the summer of 1885 a field trial was made with barley rt of the field was covered with parallel wires, about a yard art, which were secured to insulators on low posts at the margin the field. At distances of 18 or 20 inches each wire was supplied h metal points, through which a current could discharge into e air. The whole was connected with a Holtz electric machine, d the current was supplied from 6 to 10 o'clock in the morning and from 5 to 9 o'clock in the evening, from the middle of June until the first of September. The barley was well up when the experiment began, and at harvest time it was found that the yield of this portion of the field was 35 per cent. greater than the other : also that the quality was correspondingly improved. The following year the experiment was repeated upon a more extensive scale. In this case garden vegetables were the plants tested, and white beets, red beets, potatoes, radishes, parsnips, leeks, celery, turnips, and rutabagas gave increased yields in the order named varying from 107 per cent. to ¼ per cent. On the other hand, carrots and kholrabi showed losses of 5 per cent. and cabbages of 43 per cent. Further experiments with cereals and potatoes gave results that were considered very favourable.

At least one instance may be cited in which electricity has been used commercially. Near Boston a large grower has put the electric light to work in forcing lettuce so that a gain of at least two weeks on three crops is secured. Two lamps are hung above the house, and their effect is apparent for at least 100 feet.

NINE YEARS OF TEA IMPORTS IN CANADA.

Imports of tea into the Dominion during the fiscal year ending June 30, 1898. were 19,954,565 lb. valued at $2,721,189.

In quantity, this is the smallest since 1893, when the figures were 18,034,897 lbs

The imports of tea into Canada during the nine years ending June 30, 1898, were as follows :

	Quantity in lbs.	Value.
1898	19,954,565	$2,721,189
1897	24,317,104	3,310,348
1896	22,667,535	3,252,133
1895	20,610,733	3,115,025
1894	20,459,530	3,039,928
1893 ...	18,034,897	2,975,452
1892	22,593,619	3,650,940
1891	18,042,043	2,981,415
1890	18,451,378	3,073,643

The decline in the importation for 1898 cannot be ascribed to a falling off in the consumption of tea. It was undoubtedly due to the heavy purchases which were made during the previous year in expectation of a duty for revenue purposes being placed upon that commodity. Heavy stocks was the natural concomitant, which, in turn, caused a decline in importations. Consumptive requirements are limited, and, when one year the market is over-supplied, it is only to be expected that the next will be characterized by more cautious buying.

Notwithstanding the decline, however, the average for the past two years exceeds that of the previous two, the average for 1897-98 being 22,135,834 lbs., against 21,639.134 lbs. for 1895-96.

The present fiscal year promises to witness another large importtaion of tea, the quantity brought in during the nine months ending March last being valued at $2,965,068. The monthly returns from which the figures for the past nine months are gathered do not give the quantities. In value, it will be noticed, the figures exceed those for the twelve months of 1898.

The monthly average for the twelve months of 1898 was $221,765, and for 1897 it was $226,425. For the nine months of this year it is $328.345.

The fact that teas are costing more than in 1898 would in itself help to swell the value of the teas imported, but, when the full returns have been issued, it will doubtless be seen that there is an increase in the quantity as well as in the value, particularly in view of the smallness of spot stocks in Canada in first and second hands.

It may, perhaps, not be uninteresting to note that the tea imported in 1877, 22 years ago, exceeded in value the imports of tea during any one of the past nine years given in the above table. In regard to quantity, however, the conditions were the very opposite, there only being 13,575,657 lbs. imported.

Indirectly these figures show the difference in the price of the tea imported in 1877 and 1898 respectively, the cost being 25·90c. per lb. in the former year and 13·63 in the latter, a decline of over 47 per cent.

Taking the population at 5,000,000 in 1890-91, and at 5,500,000 in 1897-98, the average consumption of tea in Canada per head during the former two-year period was about 3·64 lbs. and during the latter 4·02 lbs.—*Canadian Grocer.*

LIMESTONE, A MANURE FOR TEA.

It is now pretty well an accepted fact that one of the things on which the future of Indian tea depends is the throwing up of unprofitable patches and concentration of energy on the high cultivation of those portions of the gardens which, from *jat* of plants and suitability of lay and site, promise remunerative returns. By the term "high cultivation," is not meant the ceaseless hoeing of steep inclines, or even of flat lands, liable to submergence during the rains, but the application to tea planting of those principles of agricultural science which have proved so successful in Europe, America, and the Colonies. The tea-planter of the present day has not only to combine within himself the qualifications which have hitherto been considered those of a good manager, tea-maker and accountant, but he is further required to be somewhat of a skilled agri-horticulturist and entomologist, versed in the proper drainage of lands, the application of manures (in the blending or proper admixture of which he should be an adept), and in the treatment of diseases incidental to the tea plant. Indeed, gentlemen of the stamp of Sir Alexander Mackenzie would have him *au fait* with an encyclopædic list of other branches of knowledge, or branded as "incompetent."

Attention has from time to time been drawn to the value of crude limestone as the basis of most of those fertilising agents which are recognised as necessary stimulants to all lands which have been under cultivation for more than six years, by which period the average of our tea plantations attain their maximum yield. In selecting sites for tea planting, no one now who could get flat land would select *tilas*. But *tilas* more or less steep have for various reasons been planted out, and the drawbacks have been counteracted by a system of "terracing." Now, although this system is imperatively demanded to keep the plants in proper position on the hillsides, almost all the surface soil is so much disturbed in the primary operation that at the end of the rains but a very small proportion remains *in situ*. Theoretically, the only portion of the terraced land thoroughly deprived of the original vegetable deposit is the apex of the *tila* so treated, the argument being that whatever surface soil is disturbed from above is retained on the lower terraces. But in watching the effects of heavy rain on newly-terraced land, it becomes apparent that the surface soil from the light nature of its composition, is carried so rapidly over the edges (as the terraces become soaked with water), that it is almost all washed down to the foot of the hill by the end of the first rainy season. Although the loss of it has no material effect on the tea plant for the first year or two, it needs not much reflection to see that manuring by means of renovating pits upon terraced *tilas* is absolutely necessary from the time the plant commences to yield, because the very process adopted for the benefit of the plant at the outset is such as, by depriving the soil of its most valuable constituents, to ensure the rapid deterioration of its yielding powers. Much indeed might be done were the surface soil from the upper terraces scraped together and buried either in a trench running right round the inside of the terrace, or in pits dug behind the place subsequently to be occupied by the plant. But although this might eke out the yield, for a couple of seasons possibly, it is apparent to all who have had experience of *tila* gardens that without renovating aid artificially supplied, the yield must gradually fall off until it becomes no longer remunerative. To anyone knowing the Cachar and Sylhet districts tolerably well this can be ascertained beyond question by referring to the statistical accounts of the annual yield of the numerous gardens in the reports published of late years by the various agency firms. In some gardens the falling off has been so marked as to almost lead the shareholders to think that the existence of their company could only be ensured by large yearly extensions. Had the money already sunk in such extensions been employed in the scientific application of manure to the older portions of their respective properties, the average outturn would have been maintained, and the gardens kept within the original area. These extensions have necessitated a much greater expense in the way of additional labour and supervision than the careful nursing of the old gardens would ever have required.

The efforts of tea planters should be directed to the utilisation of all such material for forming manures as can be collected within a reasonable district of their gardens, such, for instance, as cowdung, stable refuse, and *bhil* soil. But, as is well known, these manures alone do not possess the requisite strength to compensate the plant for the severe strain put upon it, and so long as this demand is exacted it is evident that something more stimulating and nourishing is required. The merits of limestone are well known, and what is required is a compost of all animal refuse, mixed with one-third its bulk of crushed limestone. A regular system of manuring with such a compost would largely increase the yield of all *tila* gardens where renovating pits could be dug without endangering the stability of the plant. Where this work has not already been adopted, it will, of course, take time, but in the present state of the tea industry an increased yield, as soon as possible, is absolutely necessary, and the effects of manure such as recommended would increase the outturn far quicker than large extensions even of the best *jats*, which would remain for two or three years at least a dead weight on the finances of the concern. All doubts hitherto expressed as to the safety of applying limestone to tea have long since been laid to rest. Its value is now greatly appreciated. Its use as the basis of a compost is advocated because it is procurable in limitless quantities and at a nominal price,—recommendations which cannot but have due weight with proprietors at the present time.—*Planter.*

MARKET REPORT.

By Mail advices of 12th May, 1899.

COFFEE.

The *London Commercial Record* says:—The whole of the week has been occupied in the disposal of postponed sales, of which there are still many to be completed, and the congestion was intensified by Wednesday being a lost day, owing to the bad light. The demand has been irregular, and faded qualities of East India continue more or less neglected even at a decline, but the trade demand for desirable grades has been better at about former prices for second size, and dearer for bold lots. Costa Rica in good request, and firm to rather higher prices paid for colory quality. In other Central American descriptions transactions have been limited and prices irregular. "Futures" have experienced some slight fluctuations, but closing prices shew no material change for the week, viz.:—

London	... Santos	... July delivery	... 29s 3d
New York	... No. 7 Rio...	„ „	... 5.25 cents.
Hamburg	... Santos ...	„ „	... 29½ pf.
Havre	... Santos ...	„ „	... 36 francs
Holland	... Good ordinary Java	..	... 27¼ cents.

Auctions this week have gone off as under:—

East India.—3,617 bags partly sold—*Mysore*, smalls 37s to 51s, low middling to middling 46s to 63s 6d, bold faded greenish 66s, good bright gray to blue 82s to 94s, pea-berry 70s to 88s. *Coorg*, smalls 35s 6d to 45s 6d, low middling to middling 48s 6d to 60s, good middling 66s, bold good colory 82s to 90s, pea-berry 73s 6d to 85s. *Neilgherry*, smalls 42s to 55s low middling to middling 53s, to 65s, good middling 66s to 68s 6d, good to fine bold 79s to 101s 6d, pea-berry 68s to 86s 6d. *Wynaad*, smalls 39s to 42s, low middling 52s, bold 75s.

Jamaica.—263 barrels 143 bags mostly sold, ordinary palish 29s to 30s, good to fine ordinary greenish 32s to 36s 6d, fine fine ordinary to low middling 39s to 46s 6d, middling 49s 6d to 52s per cwt.

Costa Rica.—4,331 bags mostly sold, smalls 37s 6d to 43s, good to fine fine ordinary 38s to 45s, low middling to dull colory 48s to 51s, middling greenish to bright blue 59s to 67s, good middling to bright blue 69s 6d to 75s, good to fine bold blue 78s to 99s 6d, pea-berry 64s 6d to 92s 6d.

Salvador.—Of 979 bags offered a good part sold, smalls 31s, fine fine ordinary greenish 43s to 44s, low middling to middling colory 46s 6d to 53s, good middling 56s, good gray bold 66s to 66s 6d, fine bold blue 81s, pea-berry 58s 6d to 65s.

Guatemala.—Of 798 bags catalogued a small part sold, triage 27s 6d to 28s, smalls 42s to 42s 6d, good ordinary pale grayish 38s.

Mexican.—223 bags nearly all sold, smalls 28s 6d, good middling brownish colory 57s, good bold 85s, pea-berry 85s.

Savanilla.—127 bags sold, fine ordinary to low middling 40s to 45s, middling pale grayish 50s 6d, bold 56s, pea-berry 49s to 55s 6ds.

Colombian.—813 bags nearly all sold, fine fine ordinary to low middling greenish 43s 6d to 48s, middling to good middling 50s to 58s, fair to good colory bold 61s to 72s, fine 80s to 85s, pea-berry 54s to 70s 6d.

TEA.

CHINA.—Auctions have presented 5,162 packages during the week, demand for which has been fair, resulting in recent values being supported for Congous, whilst green teas were a little easier.

INDIAN.—Rather larger sales were held totalling 15,200 packages, contrasted with 9,600 packages in the week before, and 21,700 packages last year.

There was a fair enquiry at about former rates for the medium and better grades, but common and ordinary passed flatly and often at a further slight decline, while a considerable quantity was withdrawn owing to offers being below the ideas of importers.

Fine tippy Teas received more attention, among which the following were noticeable:—Hapjan (A.F.T. Co.), P.O. Pekoe, 2s 6½d, and F.O. Pekoe, 1s 7¼d; Kobong (A.F.T. Co.), F.O. Pekoe, 1s 7¼d; Hilika (A.F.T. Co.) B.O. Pekoe, 1s 7½d; Cinnamara (Jorehaut Co.), O. Pekoe, 1s 8½d, and B. Pekoe, 1s 7½d; Mijica Jan (Maj. Co.), B.O. Pekoe, 1s 8d; and Joyhing (Jok. T. Co.), F.O.P., 1s 7½d per lb.

For 11,000 packages on Estate Account 9d per lb. was obtained, against 7⅛d per lb. for 11,700 packages, and 6¾d per lb. for 4,800 packages in the two foregoing years.

CEYLON.—Auctions comprised 22,300 packages, *versus* 21,000 packages on the 2nd inst., and 22,200 packages at this time in 1898.

With a limited business doing in the country, and at the moment a lack of export orders, buyers were disposed to act cautiously, especially in bidding for parcels over 8½d per lb. Dealers were anxious to secure Pekoe Souchongs and Pekoes from 7d to 7½d per lb at a fractional reduction on the basis lately current, so that although these descriptions met with spirited competition prices occasionally went against sellers. Quotations for good medium Pekoes, Orange Pekoes and Broken Pekoes ruled very irregularly and generally easier, notwithstanding the reasonable scale now prevalent for them.

The average is 8⅛d per lb. On the 4th inst. it stood at 8¼d per lb., while in 1898 it was barely 7¾d per lb.

JAVA.—About 800 packages (547 being of direct import) passed the hammer, and in sympathy with other growths prior values were scarcely maintained.

Nearly 4,000 packages are declared for next week.

Deliveries.—The clearances of all tea (on which duty has been paid) from the London Warehouses, as per official returns, were:—

From 1st to 9th May, 1899 ... ... 4,882,590 lbs.
„ „ 1898 ... ... 5,029,165 „

During the week the following have been printed for sale by public auction:—

	Sold.	Withdrawn	Total offered.
	Pkgs.	Pkgs.	Pkgs.
India	10,808	4,349	15,157
Ceylon	21,102	1,222	22,324
Java	451	351	802
Total ...	32,461	5,922	38,283

Also 402 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated May 12th, 1899, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON
FROM 1st JUNE TO DATE.

	Indian.	Ceylon.	Java.
1898-1899 ...	1,545,827 pkgs.	1,060,980 pkgs.	44,625 pkgs.
1897-1898 ...	1,547,944 „	1,129,855 „	5,575 „

15,604 pkgs. Indian
22,396 „ Ceylon
802 „ Java
} Total 39,802 packages were offered in public auction this week.

Indian. Sales are now becoming very small, only 15,604 packages being brought forward this week, while for next Monday catalogues are issued for only 8,932 packages. With a good demand, prices were maintained at about last week's rates, while buying apseared to be decidedly more general, with better competition then has lately been noticeable. 306 last of the season invoices have been sold to date against 306 pkgs. during the same period last year. It is too early yet to say much about the quality of the new crop, but musters to hand indicate fair Teas for the time of year coming forward from Darjeeling and Dooars.

Total Tea sold on Garden Account, 1st June to date 1899, 1,144,687 pkgs., av. 8 79d. 1898, 1,124,722 pkgs., av., 8 66d.

Ceylon. 22,396 packages were brought to auction against 21,065 last week, the quantity proving quite as much as buyers were prepared to take. The market was somewhat irregular, Teas under 8d. occasionally showing a slightly easier tendency, while medium Pekoes and broken Pekoes were very frequently ¼d. to ½d. per lb. cheaper. Avge. for week 8·16d., against 7 72d. same period 1898.

Ceylon Tea sold on Garden Account, 1st Jan. to date 1899, 371,678 pkgs., av., 8·44d. 1898, 416,692 pkgs., av., 7·64d.

Java. Amongst the Javas 547 packages were of direct import and 255 packages were brought over from Holland; the tendency in sympathy with Indian and Ceylon Teas was to rather easier rates.

Bank rate 3 per cent. Exchange on London three months' sight:—Calcutta $1/4\frac{5}{32}$. Colombo $1/4\frac{5}{32}$.

COCOA.

Offering at Tuesday's auctions consisted of 7,451 bags Colonial and 450 bags Foreign. There was very little demand, notwithstanding no public sales had been held for a fortnight, and large withdrawals were made rather than accept the very low prices offered. The result was that only 280 bags changed hands under the hammer at some decline on rates previously ruling. The sold lots comprised 127 bags good Trinidad at 71s to 72s, 39 bags Grenada at 65s to 68s for fair to good, 2 bags Dominica and 2 bags St. Lucia at 65s 6d, 85 bags Jamaica at 64s to 67s for common damp to good fermented, and 30 bags Ceylon at 52s 6d to 62s per cwt. for blacks and good pickings. Privately 400 bags Trinidad sold at 68s to 75s, 100 bags Grenada at 66s to 69s 6d, and 60 bags Ceylon, red at 74s, Native 66s per cwt.

PEPPER.

Black.—The market has been quiet this week with a limited business at 5¼d for fair Singapore on the spot, at $5\frac{9}{16}$d down to $5\frac{3}{8}$d for near at hand parcels, at $5\frac{3}{8}$d down to $5\frac{9}{16}$d for June-August, and at $5\frac{11}{16}$d down to $5\frac{9}{16}$d July-September shipments. On the spot sales of Trang are reported at $5\frac{3}{8}$d to $5\frac{1}{2}$d.

At public sale on Wednesday, of 174 bags Singapore only a few bags sold at 5d for ordinary and 4¾d for very light dusty and [illegible] 182 bags Penang withdrawn. 20 bags good heavy brown [illegible] realised 5⅛d per lb.

White is also quiet, with a retail business in fair Penang at 7⅞d. and of good Singapore at 8¾d. Penang has been sold for arrival at $8\frac{1}{16}$d June-August shipment.

At auction on the 10th inst., of 64 bags Singapore, 145 bags Siam, and 130 bags Penang offered, only 20 bags fair brown Siam, ex land carriage, sold at 8¼d to 8⅜d per lb.

GINGER.

Cochin flat. 110 cases 462 bags offered, but only 6 bags cuttings sold at 17s per cwt.

Japan.—90 bags were bought in.

Jamaica.—The very large quantity of 1,313 barrels offered, and prices obtained registered an irregular decline of from 3s to 5s per cwt., viz.:—good bold hard washed 77s 6d to 80s, bold and medium ditto 73s 6d to 75s, medium to fair leanish washed 66s to 72s, common to good ordinary leanish 54s to 64s 6d per cwt.

CINCHONA.

The *Chemist and Druggist's.*—Our Amsterdam correspondent, following up his cablegram in last issue, states that the auctions of Java cinchona-bark passed off very quietly. The richest parcel of bark offered at the sales was a lot of 18 bales Ledgeriana stem bark in broken quill, produced on the Government estate. It analysed 8·89 per cent. of sulphate of quinine, and sold at 76½c. per half-kilo. The highest price paid was 91c. for a parcel of Succirubra, long quill, which analysed 2·20 per cent. quinine sulphate. The East Indian twig bark realised 8¼c. Of the 604,345 oz quinine sulphate in bark, 463,610 oz. sold, at a decline of 23 per cent. owing to the increased shipments from Java. The prices were lower at the end than at the beginning of the auction. In London to-day most of the offerings sold at easier rates, especially Calisaya. Java root bark (2·40 per cent. quin. sulph.), damaged, was bought in nominally at 10*d.* per lb.; bold flat yellow bark sold at 3*d.* to 4¼*d.* for damaged. Bolivian cultivated Calisaya, mostly thin papery, realised 8*d.* down to 4¼*d.* for damages; for sound, 9*d.* per lb. was refused; thick flat Cartagena, sound, was limited at 4½*d.* per lb.

The exports from Guayaquil in 1898 were 863 quintals, valued at 1,726*l.*, as against 1,364 quintals, valued at 2,728*l.*, in 1897 (1 quintal = 101½ lbs.). The ruling figure at Guayaquil was 2*l.* per quintal.

QUININE.

The reduction in the unit at Amsterdam last week, combined with the heavy shipments of bark from Java, has had a depressing effect on the market this week, and the tone throughout has been quiet. Friday and Saturday of last week saw a small business in second-hands at easier rates, including June delivery at 1*s* 4½*d.* per oz., and August at 1*s.* 3½*d.* to 1*s.* 4*d.* the week closing with sellers at the lower quotation. The market recovered slightly on Monday, when some 20,000 oz. were turned over at 1*s.* 3½*d.* to 1*s.* 3¾*d.* on the spot, and August delivery at 1*s.* 4*d.* and 1*s* 4¼*d.* and on Tuesday there was a few small deals at 1*s.* 4*d.* and 1*s.* 4⅛*d.* per oz. for the latter position. Yesterday and to-day little has been done. Makers' quotations unchanged. Several job lots were offered in auction to-day, and a bid of 1*s.* 1*d.* was accepted "subject" for a portion of it, but the holder insisted on 1*s.* 4*d.* for sulphate, and 1*s* 10*d.* for muriate; so the deal was cancelled. The tone is distinctly firmer to-night.

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittance, should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday the 16th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Coorg.

Polli Betta, *7th June.—Weather.*—It has been like monsoon all through since the 20th ultimo, though very light. Showery weather with plenty of intervals of sunshine. Fine growing weather. Last night and this morning ·30 inch of rain fell. Monsoonish weather more pronounced since yesterday for sometime. Previously it was fair. *Plant diseases.*—Eradicating and burning borer nearing completion of first circuit of estates. Not severe this season. Coffee looking fine. Labour plentiful.

THE FOOCHOW TEA TRADE.

One or two warnings have been uttered lately to the effect that Indian and Ceylon tea planters must not consider China as "out of the race." The "hare and tortoise" business must not be repeated, for China may yet awaken, and, if the British Tea duty be further lowered, this may possibly act as a stimulus to Chinese traders and to the Celestial Government. Hence, we must not shut our eyes to what is going on in the China tea trade, but must rather watch every movement, slow though all may be, and be ready for any change that may occur. From Foochow, where four-fifths of the trade done is in Tea, we learn that the quality of the 1898 crops generally was perhaps rather better than that of 1897. There was a smaller proportion of common Congou, perhaps because of the change of standard in the United States. The first shipments to London in 1898 realised fair prices and showed profits where sales were effected without delay, but prices subsequently declined rapidly. The American markets were active during the spring, but the very high standard adopted by the Government for the admission of tea into consumption curtailed shipments generally. As regards Australia, shipments to that market

resulted on the whole satisfactorily, small profits being the rule and large returns occasionally available. This is largely attributed by China tea merchants to the fact that the prices of Ceylon teas, which now supply the bulk of the Australian requirements, have been exceptionally high, This has caused a demand for Foochow sweet-liquoring. common, and low medium teas to help to reduce the price of blends, in which ordinarily less Foochow tea is mixed with the Ceylon product. Finer China teas continued to be less and less inquired for. A factor in the success of the year's trade in Australia is said to have been "the way in which shipments have been regulated to meet the immediate demand upon their arrival, instead of, as in past years, two-thirds of the year's supply being forwarded in the first month of the season, and the market consequently overloaded." This is interesting in the face of the recent evidence of the Messrs. W. J. Thomson, senior and junior, before the Indian Currency Committee. It shows that a grave disadvantage under which China teas have laboured in the past, can be removed by the Chinese at will.

European Continental markets are thought to have been rather over loaded last year, and, as regards China leaf, it is said, "not only have direct shipments given a far poorer result, but the demand for the Continent on the London market has been very slack and prices so weak as to cause loss to the importer, a fact which has also damaged the out-turn of direct shipments." An interesting remark is that "there is no doubt that Ceylon teas are gaining ground on the Continent, and most shippers expect that here, as in every other market, where Foochow teas have to compete with Ceylon, the former must go to the wall." The following table shows comparative exports for three years :—

	1898-99.	1897-98.	1896-97.
	Lbs.	Lbs.	Lbs.
To Europe	12,839,390	12,607,188	12,749,506
Australian	5,818,934	4,444,217	6,208,357
United States and Canada ..	8,439,625	7,536,521	11,716,764
South Africa	1,417,903	1 257,944	2,577,719
Coastwise—South	3,387,355	3,174,470	4,262,938
Do. North	5,892,618	6,361,542	13,719,815
Total ..	37,795,825	35 381,882	51,235,099

Exchange, by the way, did not help the China tea trade in 1898. The lowest point for 4 per cent. bills was 1*s.* 11*d.* (June), and at the end of the season the rate was 1*s.* 11$\frac{15}{16}$*d.* The statements referred to above do not, in fact, lend much colour to ideas that the China Tea trade may revive; but it must always be borne in mind that the Chinese are quick to accommodate themselves to circumstances; will change the style of tea manufactured whenever they notice an alteration in demand, and are only shut out from fair competition with other countries by the restrictions and taxes imposed by iniquitous officials. Should these obstacles ever be removed, the China Tea trade may yet be spoken of as threatening dangerous rivalry to the Tea industry in India and Ceylon.

Apropos of this, a few remarks on the failure of the Foochow Tea Improvement Company will serve to throw light on some of the main difficulties that hamper the Tea trade in China. In a recent report the British Consul at Foochow remarks that, although it is admitted by all experts, both native and foreign, that the use of machinery does improve the manufacture of tea both in leaf and in liquor, the quality and quantity of the green leaf in the Pakling district, where the Company's factory was situated, afforded insufficient scope for the Company's operations. After the season 1897 was over, the manager and the Chinese manager were sent into the Panyong district to see if it were feasible to start a factory there. Their report was favorable as regards the leaf, but the trade was found to be so hedged round with monopolies that, in the absence of support from the Chinese directors and shareholders, some of whom are interested in Panyong teas, it was decided to be useless to commence operations there. The total output for 1898 was only 3,105 half-chests, 100 boxes, and 1,080 bags of siftings. All were offered at Foochow for public sale, and, when offers were unsatisfactory, shipped to London on the Company's account. The result was a very heavy loss. This is not the point of chief interest for us here, however. The British Consul observes:—"The Company's want of success is ascribed to the difficulty of getting machinery into the interior beyond treaty port limits, and to the absence of special support from the customs and Consular authorities, but the heavy fall in the prices obtainable for China teas, and the consequent tendency of tea cultivation to give way to cereals, have probably had more to do with it." These words afford food for thought.

VANILLA IN CACHAR.

From an account of an experimental garden in Cachar, printed by the *Planter*, we learn that *planifolia* is considered more suitable than *aromatica* for that district, as the latter will only grow rapidly when the temperature is pretty constant throughout the year. The vanilla under reference was planted on slightly raised beds of well-rotted leaf mould and rich sandy soil. A great many plants died off, apparently from damp, damping off near the ground. They commence to flower when they are about three years old, and as from the peculiar disposition of the male and female organs, insects are unable to fertilize them, this must be done artificially. A portion of the pollen is, therefore, taken from the anther by means of a small thin slip of the bamboo and introduced into the stigma. After the pods set, they continue to grow until several inches in length and when mature in eight or nine months, the base commences to turn yellow. They must now be carefully gathered, selecting only the ripe ones. There are several methods of curing the pods, but perhaps the simplest and best is that adopted in Mexico, where they are placed in heaps in a shed for a few days to colour, after which, if the weather is warm and dry, they are spread on blankets and exposed to the morning sun. Before mid-day they are wrapped up in thin blankets, but allowed to remain in the sun until evening, when they are taken indoors and shut up (still wrapped in their blankets) in closed boxes to "sweat" all night. The next day the same treatment is repeated, and the beans, after exposure to the sun, acquire a dark coffee colour, the shade being deeper in proportion to the success of the sweating process. If there should happen to be damp cloudy weather, the necessary heat is obtained by artificial means. The pods have then to be dried by exposure to the sun, morning and evening, after which they are tied in bundles, and packed in small air-tight tin cases like cigar boxes.

This is obviously a mere sketch of how things are managed in Cachar, but we should be glad to learn what prospect there is of vanilla proving *a commercial success* there. It is unquestionably an article that demands very skilful manipulation, especially in the curing; and probably its future in India will depend largely on the ability of planters to acquire the knack that has led some Mexican vanilla growers to fortune. Without that knack mere successful cultivation means nothing very tempting; on the other hand, successful cultivation is certainly the primary essential.

BOARD OF TRADE RETURNS FOR APRIL.

The following figures show the imports of certain commodities into the United Kingdom during April last:—

Cocoa (raw) there was a marked expansion in the supply, which, in spite of handsome deliveries piled the bonded stock up nearer to that in the previous year.

In the first four months.		1899.	1898.	1897.
Imports ...	lbs.	19,692,702	20,417,447	15,472,038
Home consumption ...	„	12,962,246	11,476,978	10,627,773
Exports ...	„	4,403,255	3,400,471	4,906,009
Stocks in bond ...	„	18,231,000	20,631,000	24,113,000
Value of imports ...		£600,277	£608,531	£414,915
„ exports ...		140,239	108,175	130,063

Cocoa (prepared).—The quantity landed was only about a moiety of that in 1898, and with fair deliveries, there was a further diminution of stock.

In the first four months.		1899.	1898.	1897.
Imports ...	lbs.	1,857,838	3,464,396	2,521,406
Home consumption ...	„	2,036,640	2,178,382	2,369,591
Exports ...	„	327,977	179,791	156,264
Stocks in bond ...	„	805,000	1,449,000	76,000
Value of imports ...		£173,898	£236,594	£187,844
„ exports ...		35,576	20,073	17,875

Coffee.—Greater abundance was observed in April, and with but trifling augmentations in the clearances, the stock in bond became of wider dimensions.

In the first four months.		1899.	1898.	1897.
Imports ...	cwts.	486,030	403,852	417,726
Home consumption ...	„	92,704	88,845	87,427
Exports ...	„	174,867	153,953	102,225
Stocks in bond ...	„	528,000	358,000	315,000
Value of imports ...	„	£1,777,538	£1,816,940	£1,926,395
„ exports ...		627,315	619,335	454,788

Chicory arrived but moderately, and, being delivered more freely, the stock was palpably diminished.

In the first four months.		1899.	1898.	1897.
Imports ...	cwts.	29,692	35,463	31,643
Home consumption ...	„	27,657	27,711	28,936
Exports ...	„	149	284	607
Stocks in bond ...	„	13,000	16,000	11,000
Value of imports ...		£14,693	£15,153	£14,152
„ exports ...		174	268	604

Tea.—The receipts were quite normal, but the duty payments, in anticipation of a higher impost being levied, were puffed out far beyond the immediate requirements of the trade, and the bonded stock was made to look very small.

In the first four months.		1899.	1898.	1897.

THE INDIAN TEA ASSOCIATION.

We are glad to see it stated in the report of the General Committee of the Indian Tea Association for the year ending 28th February 1899 that "the two Planters' Associations in the Travancore District have again subscribed liberally" to the American Tea Fund, though we should be still better pleased to see all South India working together to push trade in markets other than London. There are *three* Planting Associations in Travancore, by the way, so one of them stands out—with the rest of Southern India. For our own part, we doubt if this American trade is now being properly catered for, and the uncertainty as to whether the I. T. A. will co-operate with the Ceylon Planters' Association in pushing continental trade, or will act independently, makes it impossible to forecast the future. Some remarks of the *Times of Ceylon*, with comments by the *Madras Mail*, are given in this issue and deserve consideration. As for the rest of the report of the I. T. A., extracts from which are given on another page, we have from time to time kept our readers informed of such of the plans and operations of that body as are of interest to planters down South, and it is unnecessary either to comment upon these again or to touch upon the many important matters of purely local interest that have been dealt with by the Association during the year. We should like to see the U. P. A. S. I. as powerful and as progressive as the I. T. A., but this can hardly be, for the planting interests of Southern India are, after all, very small when compared with those of the North. We ought to push onwards, however, and to do this successfully combination and union are indispensable.

TEA FROM SEED TO CUP IN SOUTHERN INDIA.

(BY THOMAS BROWN, GLENDALE, COONOOR.)

I.

Selection of Site.—The following points should be attended to in the choice of land for tea:—

Choose—

1. Land facing east with a protecting ridge to cut-off the east winds.
2. Land with a good depth of leaf-mould.
3. Undulating land with the natural gradients never exceeding 1 in 15.
4. Land with a good stream of water with a good head, flowing through centre.

Avoid scrupulously—

1. Land with large sheets of rock.
2. Land with great hills towering over it.
3. Land cultivated for years by natives.

Elevation & Rainfall.—As to elevation and rainfall. In Ceylon tea grows from sea-level up to 7,000 feet, on the Nilgiris from 3,000 to 8,000.

At the lower elevations about 100 and at the higher elevations 60 inches of rain, equally distributed throughout the year is best.

For maximum flavour, combined with a paying yield, there is nothing to beat an elevation of 5,000 feet and a rainfall of 70 inches.

Water Power.—It adds much to the success of a garden if sufficient water, in the driest season, to drive at least 20 H. P. can be secured, and this without a long and expensive lead of pipes.

Factory Site.—Attention must be paid to the site for the future factory, which should be central, free of knolls that will need expensive cuttings, and one to which the water can be led without much cost.

Bungalow Site.—The Manager's bungalow is best by the side of the factory, with, if possible, a covered passage leading into it, so that he may be constantly in-and-out at all times without notice.

The Manager must be *always on guard* if the undertaking is to succeed well; at the same time, he must be able to be so without feeling any difficulty whatever. The factory should become a part of his home, in fact.

Clay for Bricks.—It is desirable that there should be a swamp near the site chosen, from which all bricks and tiles required can be cut. It adds considerably to the cost if these have to be transported any distance.

Fuel Supply.—This is a matter that need give no great concern (important though it is). We would advise the planting in of *Grevillea robusta* (bastard oak) along roads and as wind-breaks at the rate of 20 trees per acre, and reckon that one of these when large should supply sufficient fuel for a year for the produce of that acre (say, 500 lbs.) giving it 19 years to grow up again from the stool or better still from a new plant. For the first twenty years, old logs and reserves must be depended on, but, if these should prove inadequate, young *Grevilleas* can be cut and new ones put in as fast as older ones are removed. Thus a constant supply of fuel can be secured.

Trees fertilize Soil.—Besides the advantage of shelter and fuel from trees, they are great fertilizers of the soil, many (of which the *Grevillea* is one) adding nitrogen to the soil. It is probable, too, that white ants eating the roots of the cut trees, open up and drain the soil, while adding manure to it. I have always considered these mites great helpers of cultivation. True, they attack and spoil the tea bushes when in excess, but it has not been my experience so far to see any material damage done by them.

Site for Nurseries.—A good spot, free from wind and living trees, with a constant supply of water, must be chosen for nurseries and reserved for them. Work at these must be undertaken, if possible, while the jungle is being felled, care being taken to see that, when the burn is made, the heat is not likely to scorch the young plants. The situation should be quite near the bungalow, so that constant supervision can be exercised.

Estimated Cost.—I think it well just here to insert an estimate of cost, as it will give the young planter an idea of what he has to face, the work that must first of all be considered and the amount of money needed within the next twelve months, while to myself it will be a guide as to the points needing to be dealt with, so that nothing of importance will escape attention.

Temporary Buildings.—It is best to begin with these, as permanent buildings take time to put up, are expensive and house-room must be provided for a start.

ESTIMATE FOR BRINGING A TEA ESTATE OF 300 ACRES INTO BEARING:—

	Rs.	Rs.
1st year—		
Felling, clearing & planting 300 acres @ Rs 70	21,000	
Purchase of tools	1,000	
Temporary cooly lines, 300 coolies, 60 huts @ Rs.10	600	
Temporary bungalow, wattle and daub 50 x 40 ...	250	
2 weedings, 300 acres @ Rs.3 per acre per weeding	1,800	
Superintendent's salary @ Rs.150 per mensem ...	1,800	26,450
2nd year—		
To maintenance of 300 acres @ Rs.50, including manager		15,000
3rd year—		
Maintenance as above	15,000	
Cost of producing 15,000 lbs. tea f.o.b., London, over and above ordinary maintenance ...	3,750	
Cost of factory and machinery	50,000	
Total...	68,750	
Less value of 15,000 lbs., say	5,000	63,750
		1,05,200
4th year—		
Superintendent's bungalow	5,000	
Permanent cooly line, 60 rooms @ Rs.50 each ...	3,000	
Working expenses on produce, 60,000 lbs. @ As. 8	30,000	
Total...	38,000	
Less value of produce, 60,000 lbs. @ As. 6 ...	22,500	15,500
Total Capital		120,700
5th year—		
By value of 120,000 pounds tea at As. 6 per lb. ...	45,000	
Less expenses @ As. 4	30,000	
Profit—Rupees...		15,000

or 12·428 % on capital.

The figures have all been put at their lowest, so as not to give an extravagant ideas of possibilities.

NOTES.

Quinine in Japan. During the first quarter of 1899, Japan imported 20,000 oz. muriate of quinine, 19,000 oz. of sulphate of quinine, and 300 lbs. cinchonine muriate.

Coffee in Texas. Importations of coffee into Galveston have again begun *after a lapse of some years.* By far the largest quantity is from Brazil.

Ceylon Teas in Russia. From 439,350 lbs. in 1897 to 2,714,000 lbs. in 1898 is rapid progress. That is what the import statistics of Odessa show in regard to Ceylon tea.

Ceylon Tea Shipments. The official figures for shipments of tea from Colombo in May and June are—

May.—*Shipments* ..	8½ millions.
June.—*Estimate* ..	10½ to 11 millions

Quinine, &c., in the United States. In 1898 the United States imported 3,512,449 lbs. cinchona bark, as against 2,696,366 lbs. in 1897; and 3,893,541 oz. sulphate (&c.) of quinine, as against 4,364,823 oz. in 1897.

Cinchona. Last night's *Madras Mail* contains a Reuter's telegram which gives the result of the Amsterdam Cinchona Sales as "price in unit 8¼". Apparently this means 8¼ cents. = about $1\frac{13}{20}$d. per unit.

The Draft Allowance on Tea. The assents to the joint circular of the Ceylon and Indian Associations against the continuance of the 1 lb. draft allowance on tea in London represent 190,000,000 lbs. of tea (per annum), but Messrs. Densham, the leading dealers, threaten strong opposition.

Indian Tea 1899. Messrs. Lloyd, Matheson, and Carritt, of London, state that:—"Samples received of the new crop generally show rather better quality than those of the previous season, as was to be expected, the weather having been more favourable for manufacture than was the case last year.

China Tea. In the Consular report on the trade of Shashib for 1898, we read:—"But for the occurrence of the riot, some tea from Western Hunan would, I believe, have been offered for shipment by steamer in May. As things turned out, the intending shippers preferred to convey it to Ichang. Consequently, tea does not appear at all among articles of export in 1898.

"A Beneficent Insect" A correspondent writes to *Indian Gardening*:—"I see the 'B. I.' is called a 'red spider-eating beetle.' We have food for such a thing in tea. Will not some one—or body—help the 'B. I.' to a passage across from Queensland? Such immigration should be, of course, State-aided, or at any rate aided by our Calcutta Tea Association."

Exports of Tea from South India. The following are statistics of exports from Madras (Presidency and Port):—

YEARS.	MADRAS PRESIDENCY.	MADRAS PORT.
1893-94	1,775,812 lbs.	153,355 lbs.
1894-95	2,194,006 ,,	110,324 ,,
1895-96	2,510,059 ,,	101,923 ,,
1896-97	2,690,927 ,,	58,338 ,,
1897-98	3,242,079 ,,	99,886 ,,

Coffee. In these days of low prices it is curious to find the *I. P. G.* drawing the attention of tea-planters to "the cultivation of coffee as well as tea." "If the American people will not have as much of our teas as we would like them to, there is," says our contemporary, "no reason in the world why we should not have some share in supplying them with coffee." Is there not? At least there are reasons why that share is likely to be a small one.

The Revival of Cinchona. The *Ceylon Observer* is glad to know that quite a number of Ceylon estate proprietors in different districts have taken its advice and put in a good deal of "cinchona" in the fair hope of it turning out a valuable help when the trees come to maturity. It sees no reason to doubt the soundness of this expectation, judging by what is heard of cinchona bark supplies from South America, Africa, and India as well as Java.

The London Tea Market. In their last weekly cable, dated 1st instant, to Colombo, Messrs. Gow, Wilson and Stanton stated that the market generally was unchanged, demand for teas with quality weak. Average 8d.; fair liquoring Ceylon Pekoe Souchong 7½d.; 24,000 packages Ceylon sold out of 25,000 offered. Of Indians, only 7,000 were offered, 6,000 sold. Average 8d.—¼d. down. The recent falls in Indian averages have now totalled a serious figure. From about 9½d. to 8d. in a few weeks is a drop, indeed!

Coffee. The *Singapore Free Press* in the Straits is doleful. It says:—On the 6th of May one or two suggestions were offered in this journal towards the devising of some means of popularising coffee amidst the millions of possible consumers who will prefer tea for the plain reason that nothing is wanted for that save the boiling of the kettle. It is disappointing

to find that not one local planter, hard hit though the industry be, has yet had one idea to rub on another as to this most practical question.

Complaint of Tea Standards.

A press despatch from Halifax, Canada, says: "Merchants in this city have been bitterly complaining of the Government's tea standards ever since they were formulated. These standards exclude the cheapest teas, a class of goods, however, which is demanded by the Newfoundland trade, and the trade in fishing and other districts in the Maritime Provinces supplied by Halifax. One firm here that recently imported 200 half-chests of tea, inferior to the minimum standard quality, suffered seizure by the Government."

Tea in Russia.

The Russian *Official Messenger* gives some interesting details of the attempts that are to be made in the Caucasus to develop the local tea industry. A tea factory has been started by the authorities near Batoum, and machinery of the latest type, as used in India and Ceylon, has been ordered from London. The paper states that Russians prefer Chinese teas to those from India and Ceylon, and, accordingly, every effort is to be made to produce an article as much like the former as possible. With this view experts have been invited from Central China to assist and advise the local grower.

Neatly put.

A Canadian advertisement runs thus:—"All women are alike in some things. They all want a tea that is cleanly, pure and wholesome, one which is uniform and that can be relied upon in every instance. The women of Canada have been taught by judicious advertising, and have learned from experience that the only tea worthy of their attention comes from Ceylon and India. The grocer who is in business to make money can reap the benefit of this very easily. Just put these teas into stock and let your customers know you have them—you'll sell 'em all right. Try it and see.

Tea in the United States.

Messrs. Jas. and Jno. R. Montgomery & Co. report the statistical position of tea for the United States and Canada on May 1 as follows:

Total afloat to May 1, 1889	40,840
Receipts to May 1, 1899	81,104,329
Total shipment advised by mail	81,145,169
Leaving to be shipped	1,024,926
Estimated supply seasons 1898 and 1899 ...	82.170,095
Supply seasons 1897 and 1898	87.711,780
Supply seasons 1896 and 1897.	93,551,353
Supply seasons 1895 and 1896	105.300,581
Afloat May 1, 1898	1,940,909
Receipts to May 1, 1898	85,176,558
Total shipments advised by mail to May 1, 1898 ...	87,117,467

Tea? or Manure?

A Colombo contemporary writes under this heading:—A well-known Colombo buyer sends "A specimen of fine (!!) tea plucking, which is certainly a credit to the estate concerned." "This choice lot," he remarks, "is to be offered in next sale and is certain to be bought by natives and eventually hawked in our harbour under some such description as 'specially selected pure Ceylon tea.' It certainly is tea, but it ought never to have left the bush, or, if plucked, it should have been buried as manure. Where is the Health Officer? The tea may fetch 5 to 10 cents. per lb. It requires an expert (in manure) to value such stuff." For ourselves we may say we have never seen such coarse-plucked half-fired rubbish.

Tea in North Travancore.

A North Travancore correspondend writes to the *Ceylon Observer*:—Tea is looking wonderfully well at present and leaf everywhere coming tumbling in. I note the Travancore tea has been realising a much better price the last month or two; later on, when we get all our new factories in working order, we shall show Ceylon how to do it. So you, Johnnies, had better keep your weather-eye open. I see no reason why Travancore teas should not pretty well top the market later on. Soil is grand, jât of a superior description, labour cheaper than in Ceylon, elevation from 4,500 to 7,000 feet, and now that this part of the country is almost wholly being superintended by old Ceylon planters of experience, things ought to hum a bit soon.

Glutting the Market.

Thus the *I. P. G.*:—Already we notice that many correspondents write in congratulatory terms as to factories being so much ahead of last year in quantity, and as the teas are up to the present standard of requirements, and stocks at home pretty well depleted, unreflecting people may consider the outlook promising, but in the foregoing favourable condition lies the danger, inasmuch as it will lead up to glutting the market, and last season's experience will be reversed. As we know, 1898 opened gloomily, but partially recovered in the autumn when the greatest outturn is yielded. This season, we may say, the spring teas have been, and are, fetching fair average prices, but if all gardens are to "beat the record" in outturn, prices will fall to what they did in the early months of 1898.

Cocoa in Guayaquil.

The cocoa crop, the principal article from Ecuador, was much larger in 1898 than that of the year 1897, the difference being an increase of nearly 30 per cent., with an average price, without expenses, of 27 sucres 75c. (£2 15s. 6d.), the highest price being in June, 30 sucres (£3), and the lowest in December, 24 sucres (£2 8s.). The cocoa crop of 1898 gave a total of 422,094 quintals (nearly 19,000 tons), being 30 per cent. over 1897, and really the largest crop ever gathered in Ecuador. Added to this there have been very good prices throughout the whole year, so that the total result in value has been about 50 per cent over that of 1897. The last four years have given crops as follows:—

Year.	Quantity. Tons.
1894	17,467
1895	16,000
1896	15,500
1897	14,800

against 19,000 tons in 1898.

Tea and heavy Manuring.

After stating that "Ceylon estates used to be remarkable for high cultivation and heavy manuring," and that certain facts would seem to show that well cultivated old land is equal to virgin soil for the production of tea, the *I. P. G.* remarks:—"In this connection it would be advisable, perhaps indispensable, to collate information as to whether reduced prices for tea and the consequent necessity of

cutting down working-expenses have not forced the Ceylon men to lower their standard of cultevation, before drawing a hard-and-fast conclusion that Ceylon tea has fallen off in quality, merely because the tea lands are no longer 'virgin.' Our own planters would be able to throw more light on this question than we can hope from Ceylon. for the most ancient of the Island tea is very youthful in comparison to thousands of acres in Assam and Darjeeling." Of course, as our contemporary says, Tea was originally put down in Ceylon upon old coffee land by no means virgin soil.

Red Leaf.

The *I. P. G.* observes:—"Red leaf," which in the good old days went under the name of "monmara," appears no longer in the form that brokers knew it some forty years ago, and even few planters take the trouble to break it down to mix with dust pure and simple; it would not cover expenses to send it to auction in its old form, and even dust, though a bye-product, is hardly worth bothering about as tea; but our refuse (under which head both may be classified) can be utilized in another way, and, perhaps, in conjunction with fustic, turmeric, or even the common meadow mallow, play its part in the dyeing of cotton or silk goods. Everyone who has indulged in fishing knows the dodge of toning down the glittering of his gut traces by steeping them in the leaves left in the teapot, and though tea dye is not a fixed, that is, an enduring one, the chemist can easily rectify this, so that even our tea-house sweepings, which many boarding house-keepers dispense to their lodgers, may fetch a remunerative price when diverted into the right channel.

Cinchona in Travancore.

"Klondyke" writes to the *Ceylon Observer*:—I noted some time ago in the *Observer* you are advocating cinchona growing again, more especially in the Uva district, I think with properly selected land (but where is this to be had in Uva?) and good, fresh imported seed from Java or India, one might do worse than give the old product another trial. Land suitable for cinchona will be hard to get in Uva with the exception of some few estates, which I could name, which have some reserve of jungle, but a large number of trees might be grown throughout the tea in every, or almost every estate in Uva generally. There is a quantity of very fine cinchona, over this way, chiefly Officinalis and Hybrid, and some grand renewed bark really for harvesting, if prices were only better; and I still hear of cinchona seed being sown for the rearing of plants for future planting. Travancore North strikes me as being an ideal cinchona growing country, a bit windy perhaps during the bursts of the monsoons, but, if jungle belts were left for shelter, I think Travancore cinchona would be hard to beat."

Tea in French Colonies.

"Tea: its Culture and Manipulation" is the title of an illustrated work by Monsieur V. Bontilly, recently published in Paris. The *Revue des Cultures Coloniales* describes it as the most complete and best compiled that has yet appeared in France. Of its five chapters, the first deals with the origin and botany of tea; the second and third with the working of Ceylon estates and the methods of preparation; the fourth handles estimates of expenses, returns, etc.; in the fifth the author runs over the colonies suitable for tea cultivation. Indo-China, he says, at present gets all its tea from China, but as soon as the natives learn the processes of its manufacture they will cease to import a product they can make themselves. "Guiana, New Caledonia, Réunion, and a large part of the high plateaux of Madagascar seem as though they ought to lend themselves equally well to this cultivation, for the climate of these various regions does not sensibly differ from that of the interior of Ceylon." Finally, the author gives an estimate for the working of an estate in Réunion, where expenses would be the same as in Ceylon were it not for the scanty labor-supply, which is twice as costly.

Tea in the United States.

Now that a duty is collected on tea, it is fair to assume, says the *American Grocer*, that the returns of custom houses are correct The imports for March, as reported by the United States Treasury Bureau of Statistics, were 4,307,431 pounds, of which 3,047,021 pounds were from China and 542,479 pounds from Japan. The total imports for the nine months ending March 31, all dutiable, were as follows:

From	Quantity, Lbs.	Value.
China	29,694,621	$3,646,589
Japan	28,012,144	3,827,275
United Kingdom ...	1,150,899	254,668
East Indies	1,369,322	216,980
Other Asia and Oceanica ...	1,194,285	28,929
Other countries	9,442	3,115
Total	62,230,683	$8,103,658
Total same time 1898	60,187,766	8,244,632
Total same time 1897	85,037,698	10,743,290

The total exports for the same period in 1899 were 170 pounds, duty free, and 753,258 pounds, dutiable, which leaves net imports of 61,477,255 pounds. Evidently the Tea Act, judged by the above record, is not leading to an increased use of the article.

Coffee Bags and Aroma.

A correspondent writes to the *Journal do Commercio* in regard to the disfavour with which Brazilian coffees are regarded in Europe, saying that his own experience leads him to believe that the prejudice is well founded and due to the loss of aroma of coffee *en route*. It has always been a puzzle to us, says a Brazilian contemporary, why European consumers should find our coffees so inferior when there can be no question whatever that the coffee we drink here is infinitely superior to anything to be obtained in Europe. No doubt one of the great attractions of coffee is its delicious aroma, if that be lost or partially destroyed it is easy to understand that such coffee must lose considerably in commercial value. The correspondent of the *Journal* states that the aroma of Brazilian coffee offered for sale in Europe cannot compare with that of similar coffees here and goes on to speculate as to the cause. Is it not possible that coffee, like tobacco and tea and other substances, possesses the power of assimilating aromas, and takes that of the jute bags in which it is shipped? When delivered at the *commissarios* in cotton bags it still preserves all its delicacy. It is not possible that the Jute bag really prejudices the native aroma? The point is worth studying.

The China Tea Season.

A report from Hankow, dated May 11th, 1899, says:—Musters were put on the market from both the Hankow and Kewkiang districts on the 8th instant, and since then arrivals have taken place freely, all districts being represented,

with the exception of Hohows, Kutoans, Lielings, and Ichangs. It is satisfactory to have at last a crop that is *sound* and pure, whatever defects it may have incidental to a dry season, such as we have lately had. Keemuns have met with a poor reception, quality being considered inferior to last year, when they had exceptional merit, and which became still more pronounced in consequence of the *taint* attached to the Ningchows. A few special parcels were taken at about Tls. 60, but tea men had to abate their demands considerably to effect further sales. At the close there is more doing, and total settlements are estimated at 6,000 half-chests. Ningchows are fresh and pure, but somewhat lacking in fullness and strength. They have been fairly popular, and settlements reach about 12,000 half-chests. Hankow teas compare favourably with former seasons, though occasionally dry and somewhat burnt. Finest qualities show much better value than last year. Below Tls. 25 the demand is very strong, and common grades are about Tls. 2 dearer than they were at the corresponding period last May. We estimate settlements at 40,000 half-chests.

Quality or Quantity.

"Superior Orange Souchong" sends an amusing letter to a Colombo paper. He writes:—"The loud outcry for many years past from London and Colombo buyers of Ceylon teas has been, "You must give us better quality. Make a good article, and we will give you a good price for it." Many a superintendent has been driven to insomnia, illness, and some to premature graves, by the persistent crowing of this gigantic cock-a-doodle. Now that supply has overtaken demand, how about quality *vs.* quantity? Broken orange pekoes of undoubted quality and good make are selling within 1d. of the same estate's pekoe souchong. The *H. & C. Mail* of 12th May has the following: 'In times of scarcity *all nice distinctions of quality* and degrees of preference are silently dropped,' and fanciful pickings and choosings of favourite growths have to make room for rough-and-ready purchases of 'whatsoever ill-assorted teas may chance to be on offer.' What becomes then, now, of all this *very superior* advice doled out to us *ad nauseam* during the last few years? What do Solomon's 'Sinne Durais' of Colombo and London now advise the superintendents to do? I think it would at least be in better taste if, in future, these wiseacres would admit the law of supply and demand to be all-powerful, and not attempt to take the tarpaulins off the man at the wheel when the storm is at its height."—We can only say that if this planter allows himself to be guided entirely by what is said to happen *in times of scarcity*, he is likely to learn wisdom at a somewhat high cost!

GENERAL ARTICLES.

THE BURNING OF PAPER MONEY IN BRAZIL.

Apropos of our Editorial remarks in last issue, we quote the following from the *Brazilian Review*:—

"Paper money is still being burned, 9,000 contos having turned to smoke. We continue to receive more letters than we have space to publish on the burning question, each one flatly contradicting the other and on the most scientific principles. And yet in spite of all exchange, like Truth, looks neither to the right nor to the left, goes on its way and makes no answer! Neither up nor down and so neither the reductionists nor their adversaries get any encouragement from her! *Patiencia*! Rome was not built in a day, and after all what is 9.000:000$ amongst 770 953:500$ to which, as our readers will observe, our currency is now reduced."

Replying to the question, "What is the real economical meaning of burning paper money," the same contemporary says:—

Money of whatever kind is debt. When paper money returns to Government and is finally destroyed, that debt is at length extinguished; but when debt is made current by law, the extinction of debt means restriction of the currency and, consequently, if other factors remain the same, increase of its value.

It is a fact that debt having been thus finally extinguished it cannot be liable to be employed again in the purchase of bills of exchange or for any other purpose. But, other factors remaining constant, what is lost in quantity must be gained in value and, consequently, the whole remaining current debt be raised in value and its purchasing power be enhanced precisely by that of the moiety destroyed. With less paper money the same quantity of bills of exchange will then be purchased; and, if the necessity persist, certainly neither Agriculture nor any other interest will be freed from having precisely the same demand for remittances presented at the Banks' counters as before. In that case neither Agriculture nor anyone else will have benefited, except owners of money and fixed incomes, the result being merely a fall of prices.

Again, as regards the destruction of the currency, that so much amuses our correspondent, it must be observed that in making the above statement we did so with the reserve that *other factors remain constant and normal*. Should the one other factor of value, foreign exchanges, be abnormal and become unfavourable the depreciation thus caused might and probably would be sufficient to counteract the effect of restriction of the value of the currency and and its value fall instead of rising.

In that case the remaining currency might easily become insufficient for the wants of internal exchanges and the value of loanable capital rise extortionably with consequent paralisation of industry and business. Such a crisis was but lately provoked in India by the restriction of the currency, resulting from simply refraining to emit. Those who accustomed to 4 or 5%, saw discounts rise to 9, 10 and even 12% found it a very palpable evil and by no means a 'bogey.'

It is a fact that by the action of the *moratorium* we shall have escaped paying some £10,000,000 sterling in bills of exchange, but the internal indebtedness will not have been diminished to anything like the same extent. The total amount to be destroyed will, at 18d. to the milreis, the rate agreed on, be precisely 133.333:333$333, but it is difficult to comprehend how that sum can be regarded as equivalent of £10,000,000, when at current rates it is not much more than one-third of it. Evidently the idea of the real meaning of money has not yet penetrated our correspondent's mind.

Money is debt. When the Government receives it in payment of taxes it is a mere transfer of a debt receivable, but when it burns it that debt is destroyed, not so many promises to pay, but the right to exact its equivalent in commodities or services, which may be estimated, as far as foreign commodities and services are concerned, at the current, not *par*, rate of exchange. By burning paper money at 6d. it destroys the ability to exact so many 6d. worth of goods or services. The fact that it is a promise on the part of the Nation to pay means nothing, because its ability to do so must depend entirely on circumstances generally independent of will or inclination.

Economically, therefore, we are piling up foreign debt at the rate of £3,000,000 per annum, whilst we are reducing our home indebtedness, so long as exchange remain at less than 7d, at the rate of less than £1,200,000.

So long, therefore, as the value of the currency is not raised, so long as our reduced local debt or currency is unexchangeable for larger quantities of foreign debt we are not better off, but poorer.

It is true that what our foreign creditors fail to receive during the *moratorium* and what we fail to remit must be some gain to commerce, because it is thus freed from a ruinous competition for bills and, consequently, able to remit more advantageously. Indeed it is only on this ground that it can be defended.

Had it been possible to continue payment, even on the onerous terms of 1897-8, there would have been no excuse for not doing so.

But it was not possible and the only alternative was suspension or Bankruptcy.

In order, however, that the sacrifice may be productive, that at the end of three years the results may justify the means, there is but one course to follow, to raise the value of the currency to a level at which it will be possible for the market to supply bills again in sufficient quantity not only for its own necessities but for Governments too. That cannot be secured by merely burning paper money. It must be supplemented by *economy*, not of Government merely but of the whole community sufficient to secure a favourable balance of foreign exchanges, thus reducing payments abroad still further, and by increasing our exports, or both.

A loan or sale of property, which to many seems the plank of salvation, is but a transitory relief, a soporific not a remedy. What is required is a drastic treatment that will cure once and for all!

TEA IN THE NILGIRI-WYNAAD.

We take the following from the *Times of Ceylon*:

WAYNAAD, May 29th.

Those Amshoms of the Nilgiri district, which embrace the tract of the country extending from the confines of the Ouchterlony valley (on the western slopes of the Nilgiri hills) to the southern limit of what is known, for administrative purposes, as "The Wynaad," includes the villages of Charambady, Davalah, Gooraloor, and Nellacottah, as well as the hamlets of Mookatty, Nellialum, and Pundaloo, and is traversed by the Government highroad, leading from Calicut *viâ* the Tambercherry ghât, through Vayitri to Gooraloor, 85 miles in length, as also by the line from Gooratoor into the Mysore country, through Tippoo Cardoe and Goondelpet, to Mysore city, distance 65 miles, and by the highway linking the Mysore road, along the track which connects the latter with Manantoddy, 43 miles off, through Nellacottah and Sultan's battery.

Within the last decade the hamlet of Mookatty has sprung up, and

A GROUP OF COFFEE ESTATES

opened on either side of the road, so that, for a distance of about 5 miles, before reaching Nellacottah, the line traverses *Arabica* coffee heavily shaded with *Grevillea robusta* almost continuously. These properties are all situated on what was bamboo forest; but further on, the older Nellacottah plantations (some of which were opened in the sixties) are shaded mainly with jâk and *Ficus glomeratta* (or Utti fig). It is a notable feature of this part of the country that estates which 25 years ago had yielded phenomenal crops still present a most vigorous and regular appearance, indicating that a system of cultivation has been followed which, in combination with the fertile soil and equable climate, has proved both profitable and successful.

The general elevation of Nellacottah is probably over 3,500 feet, as some of the coffee runs up to 4,000 feet.

FINE TEA—FURTHER EXTENSIONS.

From Nellacottah the road descends for a couple of miles some 600 feet, and a short distance beyond the base of this declivity a large block of land has been taken up by some cocoa planters, one part having been planted with Arabian coffee and "Silver oak" as shade, while the contiguous tract has been reserved for tea. The coffee evidently enjoys the best of treatment, no "borer"-stricken bushes being allowed to remain in the fields, and, judging by the appearance of the place, manure is liberally applied. Of the tea opened in 1898 (when the initial clearing was planted), I have no hesitation in affirming that this clearing is second to none in the Wynaad, both in the regular growth of the young plants and in the insignificant proportion of vacancies (which are apparently under 5 per cent). Marching with the past season's young tea, a very considerable extent of land is being prepared for the current season's extensions, upon which the work is so well organized that the whole will in all probability be planted up by the 30th proximo—a most important advantage hereabouts, as the average rainfall rarely exceeds 45 inches.

The ground gradually rises from the level of the property just described towards the Nilgiris, and the road traverses several older coffee estates (which appeared to be well cared for) before it reaches the toll-gate about a quarter of a mile below Gooraloor, where the line bifurcates to Mysore.....Gooraloor itself, which the writer had not visited for nearly twenty years, is situated at the foot of the Neddenduttum ghât, 32 miles from Ootacamund, and appears to have prospered exceedingly during the past few decades .....In addition to the Government buildings, Gooraloor boasts of its hospital, dispensary, post office, Protestant and Roman Catholic churches, and is probably about the best-stocked grain market in the Nilgiri coffee districts, while the position, at an elevation of over 3,500 feet, commands a wide view of the Wynaad plateau, extending into the Mysore country on the north east, and to the confines of South Coorg in a northerly direction. The Government line to Calicut, as already mentioned, branches off the Mysore road, about a mile below Goodaloor, and, for some distance along the track, traverses a considerable extent of very fine bamboo land, consisting of the Surrey, Nundutty, and Chembaly properties: the two latter in particular, some 1,000 odd acres in extent, would, under judicious treatment, make an ideal tea estate, as the old tea already opened shows that the soil and climate are thoroughly suitable, while the situation and facilities for introducing Mysore Canarese, Coimbatore Tamils, and low-country labour are unique.

THE GOLD MINING INDUSTRY.

In the early eighties gold mining was approaching its meridian; a vast amount of cinchona had been planted, either alone or amongst *Arabica* coffee, and the latter was in many instances most imprudently ignored in favour of the two other undertakings; but all this is now a thing of the past, and tea is slowly but steadily finding its way to the lands once under coffee, the appearance of the tea-fields near Pundaloor and at Charambady being very satisfactory; and firms upon the East and West Coast are reported to be extending their tea interests, which may be said to have passed beyond the experimental stage, as Charambady tea (from Kanombyle garden) averaged 10⅛d. for many months before the drop in the London tea market, and advices of the last breaks gave an average of 8¾d. It is not improbable that an effort may be made to resuscitate gold mining in the district, the initial steps to bring about this result having been taken; and, as mica has been found at Charambady, the land in that quarter is being judiciously exploited by a West Coast firm with a view to determining whether this mineral can be profitably treated. Its proximity to the Southern Capua, as well as climatic and other advantages, will always offer numerous advantages to those desirous of investing in tea in Nilgiri-Wynaad.

CINCHONA IN JAVA.

Mr. A. F. McLachlan, who is acting as British Consul in Java, has sent a report on the business of 1898 to the Foreign Office, from which we quote the following remarks regarding cinchona:

The quinine-manufactory, established in 1897, and referred to fully in my predecessor's report, has been well supported by most of the cinchona-planters. They have given it a share of their bark for manipulation sufficient to enable it to work steadily throughout the twelvemonth, and to deliver about 500,000 oz. of sulphate of quinine, while its capacity has lately been considerably enlarged.

The bulk of the Bandong manufactory's product has been shipped to London, where it has found eager buyers at satisfactory prices, whilst large shipments have also been made to New York and Amsterdam, and smaller consignments to Australia, China, Japan, and the Straits.

Another manufactory has been erected by the Cinchona Cultivation Company ("Pandan Aroem") on its estate at Paroeng Koeda in the Preanger Regencies, to convert their bark into quinine, but so far the greater part of the output has been sold for local consumption, and only small quantities have, I understand, been exported.

Exports from Java of cinchona bark during last year amounted to 11,150,000 Amst. lbs., sold at public auction at an average price per unit of 4·78c., as against 8,511,000 Amst. lbs. in 1897, at 4·70c.; 10,079,000 in 1896, at 2·67c.; 8,827,700 in 1895, at 2·79c.; 8,917,700 in 1894, at 3·95c.; and 7,342,000 in 1893, at 4·28c.

The large quantity exported last year must be attributed to a number of the cinchona-estates having taken advantage of the rise in home prices to harvest their bark on an unprecedentedly large scale, and it must not be forgotten that the 500,000 oz. of quinine, manufactured in Java, represents in bark nearly another 350,000 Amst. lbs. of bark.

Such large exports of bark are not likely to prove permanent, especially as the Bandong manufactory expects to be able to treat this year a very much larger quantity.

There is no indication in Mr. McLachlan's report of diminished cultivation in Java.

A PROPOSED INDO-CEYLON TEA COMMISSION.

Commenting on the circular letter recently issued by the Indian Tea Association (Calcutta) with a view to the raising of funds for a campaign in foreign markets generally (not in the United States alone) the *Times of Ceylon* remarks:—

The make-shift in India of an appeal to individuals, such as we had in the days of the old Tea Fund, prevents our neighbours from knowing with certainty the amount estates will subscribe year by year; and this has always been a drawback in the joint American campaign. It will be a month, or two even, before the Indian Association can say definitely how the new appeal has been received; and we are not likely to hear until then whether they desire to join forces with us in the European campaign which both communities are to inaugurate next year. We are inclined to think that the Indian Association will make the proposal eventually, because it is decidedly in their interests to do so. Their uncertain sinews of war could be strengthened by the constant and steady flow of money on this side; and—as in North America—we have been longer in the field. The details of any such project would, of course, be critically considered; but the main idea would be sympathetically received, and would be accepted, we believe, if it were on a more liberal financial scale than India's share in the American business. There are several reasons, however, why we should exempt Russia altogether from the combination. We have struggled to get into that special market for many years, and marked success is now crowning our efforts. We also have direct shipment to Odessa, which is being increased by another Russian steamer line—the visit of whose first vessel we record to-day—while India is to be left indefinitely without any such service at all. With every desire to co-operate, therefore, we should be handicapping ourselves if India now came into the Russian campaign on equal terms. As for France, Germany, and the rest of Europe, that also cannot be on the basis of the arrangement in America. There the Indian Association had its permanent representative; and his valuable services were so acceptable to us that we were content to pay part of his remuneration, and at the same time meet the cost of Mr. Mackenzie's work as a Visiting Commissioner. This time, Ceylon has been the first to appoint her representative, for a definite term and for the whole of each year. and his qualifications are such that the Indian Association are not likely to find his equal. Thus the question is—can India adjust the balance by supplying her proper share of money? If she were leaving Russia entirely to Ceylon she could do so. We doubt her ability otherwise, though recognising that she cannot be expected to avoid that promising source of demand. If a fair basis could be arrived at the saving of outlay which might be needlessly duplicated, would bé desirable; but the difficulty is that the Indian Association may want equally good terms as in America, and without being able to guarantee any permanency. Plainly, we do not think this is good enough for jointly exploiting Europe; and an early expression of our views may cause our Indian friends—desiring success for any pending negotiations—to frame their terms on a liberal scale, without which these will have little chance of proving acceptable to Ceylon.

On this the *Madras Mail* observes:—

THE TEA CAMPAIGN.

Commenting on the circular letter lately issued by the Indian Tea Association (Calcutta) to all proprietors and agents of tea gardens, inviting subscriptions for an American and Foreign Markets Fund, the *Times of Ceylon* remarks that "the make-shift in India of an appeal to individuals, such as we had in the days of the old Tea Fund, prevents our neighbours from knowing with certainty the amount estates will subscribe year by year; and this has always been a drawback in the joint American campaign." As it will be at least a month or two before the Indian Tea Association can say definitely how the new appeal has been received, our contemporary thinks Ceylon is not likely to hear until then whether the Indian Association desires to join forces with the Ceylon Planters' Association in the European campaign that both communities are to inaugurate next year. It is "inclined to think that the Indian Association will make the proposal eventually because it is decidedly in their interest to do so. Their uncertain sinews of war could be strengthened by the constant and steady flow of money on this side; and—as in North America—we have been longer in the field."

Thinking that the details of any such project would, of course, be critically considered, the *Times of Ceylon* proceeds to throw out a series of feelers. It would not have an invitation issue in due form from Mrs. Ceylon. It takes the part of everybody's friend on itself and suggests to Lady India that she should volunteer to take part in the picnic, undertaking to furnish her own supply of tea and bread and butter, and—not to ask for any cake! "The main idea would be sympathetically received, and would be accepted," our contemporary believes, "if it were on a more liberal financial scale than India's share in the American business." But immediately after saying this it adds, "there are several reasons, however, why we should exempt Russia altogether from the combination." It also observes that France, Germany, and the rest of Europe cannot be on the basis of the arrangement in America. India, therefore, is to pay her share, and to receive such share, exclusive of Russian cake, as Ceylon may think fit to give her As for Russia, it is argued that Ceylon has struggled for many years to get into that market, and that marked success is now crowning its efforts. A hint is thrown out that if India would leave Russia entirely to Ceylon, a nice little joint arrangement might be made about the United States and the rest of Europe; and our contemporary somewhat naïvely acknowledges that its remarks on this subject are framed in the hope that they may influence its Indian friends "to frame their terms on a liberal scale, without which these will have little chance of proving acceptable to Ceylon"

This is a matter of business not of sentiment. The fact that Ceylon was the first—after China!—in the Russian field gives her no claim to a monopoly there. India is free to try to drive Ceylon teas out just as Ceylon is striving to oust China teas. The work that Ceylon has done may help India in work of this kind, that is the good fortune of the one or the bad fortune of the other, if any one likes to regard it in that manner. For ourselves, we should strongly deprecate any joint action that was not on an absolutely fair basis, every market open alike to both parties—a fair field and no favour, in fact, and the best teas to secure the trade. The fact that there is no direct line of steamers from Calcutta to Odessa is a trifle. Political reasons obstruct progress in this direction far more than do trade considerations. If the British Government would not agree to the appointment of Russian Consuls in India, we fancy a direct Russian line of steamers could be arranged for without a month's delay. As for the markets of the Continent of Europe, fair play must again be the motto. So, too, in America and Canada. In some places Ceylon will doubtless obtain the preference, in others India will. There need be no heart-burning on that account. That India should contribute liberally towards the expenses is unfair, and no better basis could be selected than that of the gross exports of Indian and Ceylon teas, the contributions of each to the foreign campaign fund to be in proportions to the magnitude of its trade. Necessarily, only approximate figures could be relied upon for this purpose, and the question arises as to whether South India would wish to be included.

Indeed, there is a larger question still unanswered. That is, whether India should or should not combine with Ceylon in this matter. On the whole, we think she would be wiser if she decided to run a campaign of her own The time for co-operation has passed. China teas no longer hold the market against the world. Indian and Ceylon teas are known by repute almost everywhere, and are sold in the chief markets of all parts of the world. The time has now arrived for discrimination between Ceylon and Indian leaf. What we should like to see is an energetic and well endowed campaign conducted by India alone. Even if South India decided to act by herself, we should not blame her. Allied with Northern India she must for many years be a nonentity; alone, she may, in her own little way, be a force, and a force of increasing magnitude. Taking up one or two markets at a time she may push her way in, secure prices that will enable her to fully maintain standards of quality, and leave a little margin for campaign expenses. What is lacking is a leader, a man who will draw up a plan of campaign and place it in convincing form before his fellow-planters. It will need a strong man to secure them as followers and as subscribers. If such an one is not forthcoming, South India will probably continue her present rôle (in which some of the Travancore planters take no part) of keeping her money in her pocket and availing herself where possible of Ceylon and India's expenditure on advertisements, canvassing, demonstration, etc.

THE YACHT AND THE POT.

AN ENGLISH LYRIC ON "SIR THOMAS JOSEPH PORTER SKIPTON."

The Irish aspirant for America's Cup honors has been known for a long time in connection with teas, cheese and smoked ham, and his efforts to gain possession of the coveted cup have caused some talk about clever advertising. But the comments on that score in the American papers have been mild and of a friendly nature. The challenger's own countrymen are now poking fun at him. In a book of "Lyrics," recently published in London, the following song appears under the title, "Sir Thomas Joseph Porter Skipton:"

When a penniless boy I formed a plan
To come to the front as a business man,
So I saved some money across the "say,"
And I opened a shop in a very small way.
Chorus:
He opened a shop in a very small way.
But I made it pay. *Chorus:*
Yes, he made it pay.
And I shouldn't be what I am to-day
If I hadn't begun in a very small way.
Chorus:
And he wouldn't be what he is to-day
If he hadn't begun in a very small way.

I endeavored to sell the best of teas,
I sold good butter, and likewise cheese.
They were all of them real, for none were sham,
And the same applied to my eggs and ham.
Chorus:
And the same applied to his eggs and ham.
And I sold good jam.
Chorus:
Yes, very good jam.
And I shouldn't have been what to-day I am
If I hadn't relied on the very best jam.
Chorus:
And he wouldn't have been what to-day he am
If he hadn't relied on the very best jam.

My one small shop I soon made two,
The business then like a snowball grew,
And a good many people appeared surprised
To find my name so popularized.
Chorus:
To find his name so popularized.
Yet I advertised. *Chorus:*
Yes, he advertised.
And I shouldn't have been so very large sized
If I hadn't so carefully advertised.
Chorus:
And he wouldn't have been so very large sized
If he hadn't so carefully advertised.

And now I'm as rich as man can be;
I give and I spend in a way that's free;
And I'm not a bit proud, and I don't demur
When you call me Tom if you prefix "Sir."
Chorus:
We may call him Tom if we prefix "Sir."
For I like that "Sir."
Chorus:
Yes, he likes that "Sir."
And I shouldn't have been a real live "Sir"
If I hadn't provided the food you prefer.
But sha'n't I carry a smiling face
If I win the Cup in the great Yacht race?
There are Skipton's Teas and I don't know what
But the Skipton favorite is Skipton's Yacht.
Chorus:
But the Skipton favorite is the Skipton Yacht.
And I want that Pot.
Chorus:
Yes, he wants that Pot.
And I shouldn't have been so near that Pot
If I hadn't sold the Bacon that bought the Yacht.
Chorus:
And he wouldn't have been so near that Pot
If he hadn't sold the Bacon that bought the Yacht.

INDIAN TEA ASSOCIATION.

The following are extracts from the Report of the General Committee for the year ending 28th February 1899:—

A considerable amount of correspondence has as usual passed between the General Committee and the Assam and Cachar Branches of the Association. Mr. J Buckingham, C.I.E., of Amguri, who has so long occupied the leading position in connection with the tea industry in Assam still continues, the Committee are glad to record, as Chairman of the Assam Branch. The printed proceedings of this Branch, with copies of which the Committee are favoured monthly, indicate very forcibly the great activity which characterizes its management, and the watchful care which it exercises over the interests of the tea industry in every possible direction. It need hardly be pointed out that the tea industry in the Province of Assam is placed in a much stronger position when representations have to be made to the authorities by the existence of this Branch of the Association with its active Committee, while on the other hand the Assam Administration, as the Chief Commissioner has more than once stated, recognize the advantages of the existence of the Branch as a means of communication between Government and the planters Reference was made in the last report to the reconstitution of the Lungla Valley and Balisera Valley Branches of the Association in Sylhet, and a hope was expressed that this was only the commencement of the re-organization of the Branch in the Sylhet District. The Committee are in full sympathy with those planters who are doing their best to re-establish branches throughout Sylhet, and regret that their efforts have not been more successful. The Committee have corresponded during the year with the various Planters' Associations both in Northern and Southern India, with which they feel it is most desirable that they should be in as close touch as possible.

INDIAN TEA IN AMERICA.

Full particulars of the campaign in America, as it is the custom to call it, have already been placed before the members of the Association in the Interim Report of the American and Foreign Tea Committee in London which was published there on the 24th February and reprinted in Calcutta on the 14th March in the present year. This Report was as usual accompanied by a very interesting summary drawn up by Mr. Blechynden of the work he had accomplished during the year. In this Mr. Blechynden said he had great pleasure in recording that his relations with Mr. Mackenzie, the representative of the Ceylon Planters' Association, continued most close and intimate.

Mr. Blechynden's mission came to an end on the 30th April, and the General Committee here desire to place on record their high appreciation of the services he has rendered in the development of the Indian tea trade and of the ability with which his enterprize has been conducted. The American and Foreign Tea Committee have recommended that another levy should be raised in Calcutta on the same lines as in former years, but on the understanding that funds shall be employed to push Indian teas in any part of the world and not in the United States alone. This proposal is now under consideration, and if it is carried into effect, funds will be available for pushing the trade in France, Russia, Germany, Turkey, South Africa and elsewhere. The Paris Exhibition of 1900 will offer a great opportunity for making Indian tea better known on the Continent, and arrangements are in progress which, it is hoped, will result in having it adequately represented. These will be referred to below. A paragraph in the last Report under this head referred to the question of raising a fund for the opening up of new markets by means of a tax to be imposed on exports of tea in India, in the same way as has been done in Ceylon for some years past. The Committee, however, after giving the matter full consideration, have decided not to proceed with it, as they have ascertained there would be little probability of Government assenting to any proposals of the kind, the circumstances of India being very different from Ceylon where tea planting is the standard industry, and where the shipment of tea is all concentrated at one port.

THE PLAGUE AND EMIGRATION TO THE TEA DISTRICTS.

On the outbreak of plague in Calcutta in May last the Committee enquired from the Superintendent of Emigration what steps were being taken to put a stop to the importation of coolies from Calcutta depôts into the tea districts, and suggested that orders should be issued to prevent labourers being so despatched. A reply was

received that every possible precaution was being taken against an outbreak of plague in the depôts, but that the despatch of coolies was not being interfered with. The Superintendent of Emigration, however, placed the Committee's letter before Government, the result being that orders were issued prohibiting coolies from up-country entering Calcutta, and providing that they should proceed to the tea districts *viâ* Naihati; coolies from Ganjam, whom it was impossible to prevent from passing through Calcutta, being quarantined at Goalundo. These orders were withdrawn on the 3rd November, but were reimposed on the 6th March in consequence of the recrudescence of plague. On the 21st March in the present year the General Committee enquired of Government what measures, if any, of a similar nature to those taken in connection with coolie emigrants had been introduced with regard to ordinary native passengers to the Assam Valley. The Committee considered that any precautionary measures which might be thought necessary for garden labourers, many of whom came from districts not infected, were even more essential in the case of native traders and others from Calcutta having their head-quarters in the parts of the city infected with plauge. In reply to this letter, on the 4th April, the Secretary to the Government of Bengal intimated that His Honor the Lieutenant-Governor, while considering it reasonable that labourers proceeding to the tea districts should be placed in quarantine, did not think any such measure would be legitimate or possible in the case of ordinary travellers.

REDUCTION OF CHARGES ON TEA.

This is a matter which has been engaging the serious attention of the General Committee on this side and also of the General Committee in London The Committee were favoured early in the year with some extremely interesting papers bearing on the subject, and also on the special question of the bulking of tea by Mr. J. Buckingham, C.I.E., Chairman of the Assam Branch, and by Mr. H. Compton, Honorary Secretary of the Kangra Tea Association. Copies of the papers were sent home to the General Committee in London for such action as they might think it desirable to take. From correspondence which has passed between the Secretary of the London Association and the Secretary of the Tea Clearing House Committee, copies of which have been placed at the Committee's disposal, it would appear that every application which is made for the reduction of warehouse charges is met with a simple *non possumus*. Mr. Tye, the Secretary of the Association in London, pointed out very clearly that the scale of charges imposed on Indian tea by Warehouse Proprietors and Dock Companies in London is out of proportion to the value of the article owing to the serious decline in the price of tea, which now realised 50 per cent. less than it did a few years ago. The Tea Clearing House Committee regret they are unable to hold out any hope of a decrease in the charges for landing, storing, bulking, and handling tea as, since the present rates were fixed, wages, cost of materials, rent, rates, and taxes have materially increased The General Committee on this side are inclined to agree with the London Committee that the present high charges with which tea is burdened afford an additional argument for continuing the agitation for the abolition of the English import duty which once effected would afford a simple solution of the question of Bonded Warehouse charges. The question of bulking in this country has not progressed materially since the last Report of the Association was written. The Committee were much interested by a recent experimental demonstration of mechanical tea bulking at the Tea Warehouse in connection with a bulking machine designed by Mr. J. H. Apjohn, C. E., Vice-Chairman of the Port Commissioners. With certain improvements and modifications this apparatus would probably answer the purpose of its design, and it is estimated by the inventor that bulking, including re-packing, taring and grossing could be undertaken by the Port Commissioners at about one-fourth of the charge levied for the unsatisfactory bulking and repacking at the London Docks and this would leave a fair profit after paying a sufficient royalty to the inventor and patentee. The General Committee will watch developments very carefully in connection with this new machine, which they feel may eventually solve the difficulties which now exist in regard to the bulking of tea to any large extent on this side, and as a natural consequence will tend to the reduction of charges in London.

SCIENTIFC EXPERT FOR THE TEA DISTRICTS.

Attention has been drawn from time to time since Mr. Kelway Bamber left the service of the Association to the necessity which existed for the appointment for a fixed term of years of a scientist of established reputation to investigate the numerous important questions and difficulties connected with the cultivation and manufacture of tea, and also to study the causes and best mode of prevention of those blights, the ravages of which inflict such injury on tea plantations and which still require elucidation. The Committee of the Assam Branch in particular have repeatedly urged upon the attention of the General Committee the desirability of making an effort in this direction, but it has always appeared to the latter that unless the aid of Government could be secured, it would not be possible while an annual levy was being taken for the extension of the tea trade in different parts of the world to raise sufficient money for this particular purpose in addition. However, as the matter was again strongly pressed upon the attention of the Committee from London, about the commencement of the year, they addressed the Chief Commissioner of Assam at some length on 21st January last, intimating that if Mr. Cotton could come to their assistance with a guarantee, say of half the expenditure, they had little doubt they would be able to raise from the tea industry the balance required. A reply was received from the Chief Commissioner of Assam to the effect that while he recognises the importance of the object in view to the tea industry and the province, Mr. Cotton regrets that he is unable to hold out any prospect of being able to contribute from provincial revenues towards the expenditure which would be involved in securing the services of a competent scientist to undertake the proposed enquiry. The Committee have since addressed the Government of Bengal on the subject, and are glad to be able to state that His Honour the Lieutenant-Governor has been pleased to sanction a grant of Rs. 5,000 a year for three years for the purpose, and they have again addressed the Chief Commissioner of Assam upon the question asking whether, in view of action taken by the Government of Bengal, Mr. Cotton would be inclined to reconsider his decision.

ENGLISH IMPORT DUTY ON TEA.

The attention of the General Committee has recently been drawn to a Resolution with reference to this matter passed by the Committee of the Planters' Association of Ceylon, and printed in their Annual Report for the year ending 17th February 1899. The Resolution was to the effect that the Ceylon Committee were not yet sufficiently convinced of the desirability of a reduction of the tea duty in England to induce them to take up an agitation on the matter at present. The General Committee of this Association having been strongly in favour of the total abolition of, or, at any rate, a considerable reduction in, the English Import duty, read this Resolution with much regret, and they have asked the Committee of the Ceylon Planters' Association if they would be good enough to favour them with their reasons for passing it. The General Committee of this Association are of opinion that the abolition of the duty would lead to a considerable increase in consumption in the United Kingdom, as they think the removal of the tax would induce a greater demand for cheap tea than at present exists among the artisans and labouring classes in England. They are further of opinion that the abolition of the duty would not only tend to the removal of the abuses now existing in the London warehouses in connection with the opening and weighment of tea, but also to the reduction of the present heavy charges with which tea is burdened under present regulations in London.

OCEAN FREIGHTS.

The question of the rate of freight on tea as provided for in the agreement between the Calcutta Steam Conference in London and shippers of tea in Calcutta has been under the consideration of the General Committee. It has been felt for some time that the margin of 15s. per ton between the rates for tea and deadweight cargo was far too high and should be reduced. The circumstances of the tea industry are very different now to what they were when this agreement was signed, and in addition Indian tea, in the opinion of the Committee, is unfairly handicapped in competition with Ceylon by the extra rate of 10s. to 15s. per ton which Calcutta shippers have to pay over and above what is paid from Ceylon. Accordingly the Committee addressed the Committee of the London Association at considerable length on the 23rd February with reference to this important subject and were glad to find that the matter had been taken up almost simultaneously in London before the movement on this side had become known there. The Committee sincerely trust that the negotiations which are now in progress

between the Committee of the London Association and the Liners' Conference will result in rates being placed on a more fair and equitable basis.

HYBRID COFFEE.

The South Sylhet correspondent of The *Planter* writes that Liberian and Arabian always flower simultaneously the first time of the season in that district about the first week in March. The Liberian of course keeps on flowering at intervals during the whole monsoon. It is, he says, just coming again into a mass of blossom at the present time, at the same time a set of fruit about the size of peas is swelling away on the bushes, and last year's 'set" is gradually becoming ripe, at least as ripe as I ever heard of this kind getting. The Liberian never gets soft ripe and never gets pulpy, as the Arabian does. In any of the descriptions of this variety which I have seen, let them be describing it in Ceylon or in the Straits, it is always described as being possessed with a hard brittle testa, even, when it has been allowed to hang on the bush till it dropped off. If I were asked how this could be accounted for, I would be inclined to put it down to us having got hold of a spurious variety. If we argue from this and that, we are forced to the conclusion that in West Africa somewhere there is to be found the parent of our Liberian, which most likely would be a more regularly growing shrub, coming true to seed as a rule and ripening off its berries thoroughly. What makes me think that our Liberian is merely a shoot from a more advanced type is that it cannot have been in existence for a very great number of years in a natural state previous to its discovery. Because if it had been so the simple process of natural selection would have brought it to a more perfect state than it is at present. For instance if it had been growing in a natural state for any considerable number of generations the birds would always have been selecting the very ripest berries, leaving the others to fall in a heap below the parent tree. In the course of a few generations certain bushes would ripen off this fruit better than other and even the ripest of those would again be selected by the birds as food and the seed disseminated. The ultimate result would be that those bushes which ripened their fruit most thoroughly would be the survival of the fittest, the others naturally going to the wall. By the time this was accomplished there would be evolved a shrub with a firmly settled character which our Liberian certainly has not got at the present time. Different bushes ripen off their fruit at different times, some bushes ripen their fruit better than others. Again some bushes have an entirely different habit to others. This all points to it being a mere variety of a species which has not been as yet found, or if found has not been recognised as its parent. Of course as it is in cultivation now it would not take long to bring it into a thorough state of civilisation, because man with his intelligence can manage things considerably quicker than nature. Although the Liberian has not the fixed character of the Arabian it could be given so in a comparatively short period of time. It has been complained that we cannot get the white colour of the parchment which can be attained in the Arabian. I am afraid we never will, the nearest I have seen being a golden colour. It is again said that it does not fill the parchment after the latter is dried, which would point to its not ripening well As a set off against this, I am assured that it greatly improves in quality by being allowed to ripen for some months in the parchment after drying, before being milled.

A good class hybrid coffee between Arabian and the present type of Liberian I would imagine rather difficult to procure. One of the parents is sufficiently formed characteristically to be depended upon for giving to its progeny a tendency towards stability. But what about the other? As far as I can judge, the Liberian is by no means in a fit state for using for breeding purposes with the intention of having its good points transmitted and its bad ones eliminated. The danger will be great of having a perfect chaos of bastards. In short, the Liberian shows none of the characteristics of a species and until such times as its character becomes good and staid, we cannot look for it producing a fixed and staid progeny. Of course, as far as constitution is concerned, a cross will always improve that, and most likely the quality and quantity of fruit be increased in some instances; but we could never depend upon that fruit good and all as it might be in itself, to reproduce itself correctly. They are following a very wise plan at Dauracherra in South Sylhet by only plucking and curing for seed purposes off the very best type of bushes, those which ripen up best and those which do not go much to stem before sending out primaries. The selection of these two qualities combined ought to give it a decided character in time, but it will have to be continued.

TEA EVOLUTION.

The *Philadelphia Evening Bulletin* says:—It is interesting to note the change that has taken place in recent years in the blending of tea for consumers' use. In olden times the Chinese merchant gathered various chops and lines together of many grades of size of leaf and shade of color and deftly mixed them so that it became one uniform grade. This was put into chests, labeled and shipped to foreign ports, and was then ready for sale. The entrance of India and Ceylon teas upon the market, containing a greater amount of body, of theine, and aroma, changed all this, for as these teas come from an immense number of gardens, and no two of them produce exactly the same quality or shape of leaf, it is impossible for the small dealer to keep his supply uniform. Thus the old methods of blending teas have passed away, and now such men as Sir Thomas Lipton, of England, and Thomas Martindale, of Philadelphia, are revolutionizing the trade, in assorting and blending in the nicest proportions (so as to produce the best results), teas from almost all quarters of the tea-producing countries of the world. This it is which has made Sir Thomas Lipton so famous across the water among housekeepers and dealers, and is now likewise doing the same thing for Thomas Martindale in the United States; for of his "Caricol" blend of tea Mr. Martindale has sold in this country, in the West Indies, Mexico and Canada over 1,000,000 pounds, so that his name, coupled with the legend "Caricol," has verily become a "household" word in the land. One reason for the success of tea blending is to be found in the fact that by the blending of a number of teas together a result can be obtained which in quality as well as cheapness literally astonishes all dealers who confine themselves to the sale of teas not blended. To illustrate—"Caricol" at 34 cents per pound, its present price, will equal in cup quality most teas that are sold at 80 cents per pound and in some cities even a dollar will not buy as good a tea as "Caricol"; therefore careful housekeepers of the United States have found the use of this delicious tea to be a delight and an advantage; and hence the large and phenomenal sales as recorded above.

PRODUCE AND PLANTING.

The Position of the Tea Industry.—After the doleful rumours about the tea industry current six months since, the majority of the recently-issued reports of companies are not so depressing after all. There have, of course, been disappointments, but things might have been much worse On the whole, the season's working may be expected to show better results than was at first anticipated. Messrs. Gow, Wilson, and Stanton, who give a list of the dividends announced in their circular, point out that the average price of teas, notwithstanding some recent weakness, is well above what it was at this time last year. Here are some recent results: Alliance Tea Company: Final of 4 per cent., making 7 per cent. for year; £300 depreciation; £500 forward. Assam Company: 12½ per cent. for year. Borokai: Accounts show a debit of £223. British Assam: 8 per cent. for year, and £128 forward. Cachar and Dooars: 3 per cent. for year; £386 forward. Ceylon Tea Plantations: 15 per cent. for year; £5,000 reserve; £5,000 depreciation; £3,908 forward. Ceylon Proprietary 4 per cent. for year; £121 forward. Carolina: An interim of 2 per cent. Darjeeling, 5 per cent.; £884 from reserve. Darjeeling Consolidated: 5 per cent preference dividend to December, 1898, Doom Dooma, 12½ per cent. for year; £4,986 forward. Eastern Assam: Five shillings per share; £2,098 forward Galaha: 4 per cent. for a period of eighteen months; £1,000 to reserve; £173 forward. Highland: 5½ per cent.; £125 written off new clearings; £70 forward. Imperial Ceylon: 4 per cent.; £42 forward. Indian Tea of Cachar: 1½ per cent.; £118 from reserve fund. Jhanzie: 5 per cent. for the year on the ordinary shares, and the proportion payable on the contributory shares, leaving £301 to carry forward. Lebong: 10 per cent for year; £2,000 from reserve; £297 forward. Mazdehee: Reports show a deficit of £681. New Sylhet: Preference dividend paid, and £18 forward. Nuwara Eliya: 6 per cent.; £300 sinking fund; £2,000 estates purchase account; £1,609 forward. Poonagalla:

4 per cent.; £164 forward. Ragalla: Preference dividend paid; £64 forward. Scottish Ceylon: 10 per cent for year; £456 forward. Standard Tea Company: 15 per cent. for year; £1,000 depreciation, £644 forward. South Wanarajah: 5 per cent. on ordinary; £400 written off; £56 to reserve. Sunnygama: 3 per cent. for year; £95 forward. Sylhet Company: Nil.

Gifts with Tea.—The gift system in connection with the sale of tea has been carried to such lengths that there is no room left for astonishment as to the nature of the devices employed But presumably these schemes pay or they would not be persisted in. *The Grocer* gives an extract from a circular issued on the subject, which runs: "On behalf of my mother, the widow of the late ——, I am pleased to inform you, in reply to your note, that she regularly receives her pension of 10s. weekly from ——, as stated on the bills. My mother had been taking ½lb. of tea weekly when my father died last ——, and immediately upon receiving evidence of the death and regular purchase of the tea the first cheque was sent, and since that time a cheque for 10s. has arrived every Saturday morning. My mother is over seventy years of age, and we can never be sufficiently thankful that her remaining years are thus rendered independent. The family would never have allowed her to want; but, still, this 10s of her own gives her many little comforts, and she often says, 'Thank God for —— and Co.!'" —*H. & C. Mail.*

ON PRUNING.

Of all operations on a tea garden this is probably that most open to discussion, or rather that on which there is the greatest diversity of opinion, and this must always be so: after results are so far reaching and the number of managers who remain long enough at one place to study the ulterior results of their system of pruning is unfortunately not very large.

The theory of pruning is sufficiently plain, namely, that all non-vigorous wood must be removed, that the bush may be induced to throw out fresh young and vigorous growth, that it may always be kept in its most vigorous condition.

Many can say, and show good argument, why their own treatment of the young bush is the best; but one would be glad to hear of the results of similar tea treated in opposite styles at its first pruning; I doubt if such an experiment has ever been tried as years must necessarily elapse before such tea would be brought into comparison.

At one time I know an idea was to cut the two year or three year bush so as to get a good thick and wide plucking head on it quickly. Was not this robbing Peter to pay Paul? for when these bushes required cutting back, the pruning had to be made far lower than with their compeers who had not been so heavily treated. I have met with the opposite extreme, the bush being left to run up to so great a size as to make plucking difficult, before it was pruned at all (unless the leaders were headed off, and I do not think so). Here doubtless much leaf was lost for one or two seasons, for which I doubt if the fine bushes resulting when the tea was pruned was any adequate compensation.

The age of the bush when first pruned must vary with the districts; as in some, a two year bush is too small, and in some passably sizeable; other bushes, especially with seed at stake, require it

Let me here diverge to the ageing of tea, as there are some that confuse it; it is simple enough if it is reckoned from seed and not from the making of the clearance; as the latter can give three ages to the same growth of tea by planting seed at stake one cold season, yearling plants from nurseries of the same years' seed the next cold season, and the remaining balance from the same nurseries the next cold season. Tea being reckoned seedlings up to the following cold season, yearlings up to the second cold season, in fact the age being the completed years from the planting of the seed.

To resume: possibly the best treatment for a new bush, *i.e.*, a fair three year old or a very vigorous two year old would be—if it has a good leader (or prominent central stem), to cut that to say eighteen inches and leave the less vigorous sides three to six inches higher: with weedy plant, *i.e.*, of no strength of wood but running high, a high cut over with the intention the next year of pruning to make the bush, would possibly be the best plan, as one would get more leaf than if the bushes were left untouched; cutting should cause the wood to thicken to a decent size and the plant to improve generally; so that at the end of the year there would be a really decent bush to be pruned into shape; after this start the tea must, of course, be pruned according to the yield and growth made, and cut back and back as required.

I have heard several outcries made against heavy pruning on the score of ruining the plant, but have not seen any really bad results from it.

With careful and considerate pruning, tea should go many years before pruning need become really heavy; but if managers will in the earlier stages prune back too liberally with young tea, they or their successors must necessarily get back to really heavy pruning before they otherwise would.

One does not require to cut far below a knot, as the new shoots usually come at least an inch below the cut, and the compacted growth near the knot would probably cause the bush to bleed less, as the term is from the cut.

Now to attempt to classify the grades of pruning as near as may be, I think the following fairly represents the usual nomenclature.

Collar pruning: the collar being where the bush emerges from soil; this covers cutting from about three inches below to three inches above the surface of the soil.

Double pruning: this would range from six to nine inches and leave little but straight stems sticking up.

Heavy pruning often covers the two above; if regarded as separate, it might be classed nine to twelve inches, getting a little forky.

Half-double pruning, say, from twelve to fifteen inches; about the first severe pruning young tea should get, the bush here retains some of its form. This is also a resource of those who are afraid to risk cutting radically back, in which case the lower knots would be left.

With all these classes, all useless thin wood is usually cleared away.

Above this comes all light pruning, which has usually no other definite name to show the class of wood operated on, and any of which is styled stick pruning if all the weak wood is cleared out and only bare sticks ranging to the size of a pencil left.

After the heaviest classes of pruning, leaving the tea unpruned the next cold weather is often advocated, to let the new wood thicken for cutting on, and the plants of backward growth grow up, so that pruning may be done the second season at a good high level. I have known bad results from this in the way of outturn as well as fair results; and I think that equal results as to growth and better results as to outturn would be the outcome of plucking the tea high enough, so that pruning out the crow's feet would yet leave the bushes high enough for a clean cut at the intended height at the end of the second season.

Where very heavy pruning is done, a very early start in doing it is distinctly advisable, as otherwise it is very late in doing anything at all, and the bushes barely yield anything in the season; while when early done, it seems to recover and get under weigh before the rising temperature can catch it, and it comes away with the rest of the pruning and quickly grows to plucking length, and before the end of the season is going strong. When one considers the small yield any block, especially one that requires cutting down, makes after the commencement of November, the loss of leaf by commencing heavy pruning then is more than compensated by the superior yield next season, by its coming into plucking earlier and more strongly.

Could coolies be brought to understand what was required of them in pruning and be trusted to do it, no doubt heavy pruning could mostly be avoided, as with each seasons pruning the bad stems would be cut back out of the bush, and the bush thus partially renewed from year to year; moreover old bushes requiring it could be cut entirely back. Of course, this would also entail more careful pluckers and intelligent plucking.

For heavy pruning nothing comes so handy as the curved draw cut pruning saw, it saves the knives being used as hatchets, and the chances of breaking in cutting heavy stems it saves the coolies hands (their palms); it saves labour as more can be done for a hand and so saves expense; and it is, on the whole when carefully done better for the bush; if the stumps are to be tarred they are possibly best left unpared with the knife after the saw has been used.

The draft and thrust double-edged saw is useful for collar pruning, but the second edge is often woefully in the way of anything lighter.—[Contributed to the *Planter.*]

DISTRICT ASSOCIATIONS.

SHEVAROY.

Proceedings of a special General Meeting of the Shevaroy Planters' Association held in the Victoria Rooms on Monday, the 5th June, at 2 p.m., to consider G. O., No. 566 Ry., of 11th May 1899, *re* certain suggestions of the Consulting Engineer for Railways with reference to a proposed wire airway to the Salem foot of the Ghât and a driving road from Yercaud to Mallapuram Railway Station. PRESENT:—Messrs. C. Dickins, F. Short, B. Short, S. M. Hight, Thurston Short, Rev. J. M. Kempf, Messrs. A. G. Nicholson, C. G. Lechler, *Chairman*, Rev. M. Andersen, Messrs. C. Rahm, E. Dickins, H. B. Evans, F. B. Nicholson, R. Foulkes, J. C. Large, and R. Gompertz, *Honorary Secretary*.

The Chairman read the correspondence out and, after some discussion, it was

Proposed by Mr. Gompertz—*seconded* by Mr. A. G. Nichloson,

That if the Madras Railway will construct a wire airway (or preferably a cable tramway) from the Salem foot of the Ghat to Yercaud, and if Government will make a driving road from Yercaud to Mallapuram, this Association will gratefully accept the proposals of the Consulting Engineer, as a fulfilment of the promise of Government and a final solution of the question.—*Carried unanimously.*

(Signed) C. G. LECHLER,
Chairman.

(Signed) R GOMPERTZ,
Honorary Secretary, S. P. A.

Proceedings of a Committee Meeting of the S. P. A. held in the Victoria Rooms on Monday, the 5th June, at 1 p.m. PRESENT: Rev. M. Andersen, Messrs. C. Dickins, Thurston Short, J. C. Large, C. G. Lechler, *Chairman*, Rev. J. M. Kempf, Messrs. C. Rahm, S. M. Hight, and R. Gompertz, *Honorary Secretary*.

1. *Read* Circular of 26th ultimo from the Secretary, U. P. A. S. I., asking for suggestions and recommendations about exhibits for the Paris Exhibition of 1900.

Proposed by Mr. S. M. Hight—*seconded* by Mr. J. C. Large.

That this Association do send a sample of Shevaroy Hill coffee through the U. P. A. S. I. to the Paris Exhibition and that all expenses thereof should be borne by this Association.—*Carried unanimously.*

2. *Read* Chairman's letter suggesting that the next Annual Meeting of the U. P. A. S. I. be opened at Bangalore, on Monday, 14th August, at 2 p.m., a Committee Meeting being held on the same day, at 11 a.m., and the dinner at the U. S. Club on the same day.—*Approved.*

3. *Resolved* that this Association request that the matter of the reduction of curing charges, as well as that of obtaining improved machinery for curing, be placed on the agenda paper at the coming meeting of the U. P. A. S. I.

4. *Read* letter No. 352 (Mis.) from the Collector of Salem, saying he could see no reason why Planters should be exempted from serving as Assessors, but that the Association might address Government on the subject if it pleased.

Resolved that the Honorary Secretary be requested to address Government on the subject through the Collector of Salem.

5. *Resolved* that the Honorary Secretary inform the Secretary, U.P.A.S.I., with reference to his Circular No. 63/99 of 30th ultimo that this Association will cordially support any action that the U. P. A. S. I. may take with the view of protesting against the enhancement of the stamp duty on hypothecations of crop.

Read and recorded the following letters:—

39/U. W. Circular from the Secretary, U. P. A. S. I. Paris Exhibition, 1900, regarding space required, if any, by the U. P. A. S. I.

40/U. W. Circular from the Secretary, U. P. A. S. I., re *Paris Exhibition*, 1900, informing that the Government of India's offer, regarding certain space in the Indian Imperial Court, has been accepted by the Association, and requesting District Associations to submit recommendations and suggestions and to instruct the delegates how to vote at the next General Meeting.

41/U.W. Circular from the Secretary, U. P. A. S. I., suggesting that the Annual Meeting of the Association be opened at Bangalore on Monday, the 14th August, at 2 p.m. A Committee Meeting being held the same day at 11 a.m, and requesting to be informed whether this will suit the S. P. A.

42/U.W. Circular from the Secretary, U. P. A. S. I., informing that the Nilgiri P. A. has requested that the subjects of adulteration of coffee and deterioration of E. I. coffee, be placed on the agenda paper for the next Annual Meeting of the U. P. A. S. I.

25/P. Circular from Mr. M. Hammick, Plague Commissioner, regarding the Plague.

26/H. Letter from Mr. Hayes, Proprietor of the *Daily Post*, requesting proceedings of the S. P. A. and other particular for publication in the above paper.

31/C. Letter from Mr. J. T. Christie, requesting a berth for his son under a coffee planter on the Shevaroy Hills.

27/H. Letter from Mr. Hayes, Proprietor of the *Daily Post*, informing that all news from the planters of the S.P.A. will be published free of charge.

32/C. Letter from the Collector, Salem, in answer to this office letter No. 898, regarding planters being called upon to act as Jurors and Assessors at the Salem Sessions.

The following papers were laid on the table:—

Proceedings of the Nilgiri Planters' Association, dated 10th May 1899.

Proceedings of a General Meeting of the Mysore Planters' Association.

The Agricultural Ledgers—No. I. (Spider-wort), No. II. (Swallow-wort), No. III. (Ban-Riha, or Wild Rhea).

Planting Opinion, 4 copies, dated May 6th, 13th, 20th and 27th.

(Signed) C. G. LECHLER,
Chairman.

(Signed) R. GOMPERTZ,
Honorary Secretary.

THEORY OF THE FLAMING SWORD.

"AH, talk of blessings! What a blessing is digestion! To digest. Do you know what it means? It is to have the sun always shining and the shade always ready for you. It is to be met by smiles and greeted with kisses. It is to hear sweet sounds, to sleep with pleasant dreams, to be touched ever by gentle, soft, cool hands. It is to be in Paradise.

"There came a great indigestion upon the earth and it was called a deluge. All the evil comes from this. Macbeth could not sleep; it was the supper, not the murder. His wife talked and talked; it was the supper again. Milton had a bad digestion, and Carlyle must have had the worst digestion in the world. Ah! to digest is to be happy!"

There!—how does that strike you for a burst of eloquence? I quote from Trollope. If there is anything wrong about the theology you must hold him responsible As for its physiology and pathology (pardon all these "ologies") I can answer for the correctness of these two. And so can millions of people besides me. They speak of the curse of indigestion continually in every language; they groan and writhe under it in every land and climate.

"For many years," says one of this innumerable army of martyrs, "I was obliged to bear as best I could the torments of indigestion. My appetite was practically destroyed. I ate, of course, because one must eat or die! but after meals I had great pain at the chest and around the sides.

Sleep almost forsook my pillow, and naturally I was tired and exhausted. Sometimes better and then worse, but never free from pain and illness, I lived on with little or no hope of getting well. It is hardly necessary to say that I had medical treatment, yet no real benefit resulted from it. Happily at this time Mother Seigel's Syrup was brought to my notice, and so strongly commended that I laid aside other medicines, which were doing me no good, and began using this one only.

"In a short time I realised a great improvement; food agreed with me and I gained strength. A little later—continuing to take the Syrup regularly as directed—the pains at the stomach, sides and chest wholly ceased, and I have not felt them since. My indigestion was cured at last, and I enjoyed the blessing of health. My son, who suffered severely from rheumatism has been relieved by Mother Seigel's Syrup as by nothing else he ever tried. In gratitude I give you full permission to publish my letter should you desire." (Signed) (Mrs.) Ann Barker, Field Lane, Braughing, Ware, Herts. Oct. 7th, 1898.

It was a fortunate circumstance for Mrs. Sarah Gell, of Melchbourne, Bedfordshire, that one day she had a personal talk with Mr. Smith, the butcher at Rushden. He told the lady that in his

opinion if she went on suffering from indigestion and asthma (one of its consequences) it would be because she neglected to use Mother Seigel's Syrup. "And," said Mr. Smith, "I speak from knowledge." She had been ill with this abominable ailment for many years, and had spent time and money in unavailing efforts to obtain relief.

Acting on Mr. Smith's advice, Mrs. Gell began using this remedy at once, and tells the outcome in a letter of which we have room for the conclusion only:—

"I was better almost immediately, and was soon as well and healthy as one could wish to be. Now I keep 'Mother Seigel' in the house and it never fails to help us when needed for any passing complaint." (Signed) Sarah Gell, Oct. 5th, 1898.

Judging from the force of his comment on the disease, I should say Mr. Trollope knew something about indigestion from experience. Most literary people do. To them, and to all other victims, I confidently commend the best remedy yet found—Mother Seigel's Syrup

MARKET REPORT.

By Mail advices of 19th May, 1899.

COFFEE.

The *London Commercial Record* says:—Supplies continue on a very liberal scale, and the demand for all fine qualities has been strong. Colory Ceylon realised very full rates, and colory East India has sold well, to an advance for exceptionally fine lots. No improvement, however, has occurred either in demand or price for the less desirable grades of East India, which still fail to attract the attention of buyers, in spite of their relative low value. Mocha all withdrawn. Jamaica dull of sale, and tending easier. Foreign growths underwent little or no change. Auctions were suspended on Wednesday for the Whitsun holidays, and a considerable quantity of catalogues is left for the re-opening on the 25th inst. Futures have been quiet, and prices generally are rather easier for the week, closing as under:—

London	... Santos	... July delivery	...	29s 0d
New York	... No. 7 Rio	... „ „	...	5.15 cents.
Hamburg	... Santos	.. „ „		29½ pf.
Havre	... Santos	... „ „	...	35¼ francs
Holland	... Good ordinary Java	..	...	27¾ cents.

Imports, Deliveries and Stock of Coffee in London are as follows:—

	Stock.		Imports.	
	1899.	1898.	1899.	1898.
Tons ...	21,906	15,083	22,481	20,675
	Home Consumption.		Export.	
	1899.	1898.	1899.	1898.
Tons ...	6,345	5,866	8,674	9,325

The preceding figures exhibit—

In the Imports an increase this year of 1,806 tons.
Home Consumption an increase of 479 „
Export a decrease of ... 651 „
Stock an increase of ... ... 6,823 „

Auctions this week have passed off as follows:—

CEYLON.—*Plantation.*—15 casks 6 tierces 21 barrels 138 bags mostly sold; pickings 28s 6d, smalls 48s to 67s, low middling to middling 92s to 104s, fair to good bold 106s to 112s, pea-berry 95s to 121s.

EAST INDIA.—5,138 bags mostly sold as follows: *Mysore*, smalls 38s to 62s 6d, low middling 42s to 55s 6d, middling to good middling colory 62s to 76s, fine middling 91s to 91s 6d, faded greenish bold 68s 6d to 74s 6d, good to fine bold blue 80s to 101s 6d, pea-berry 70s to 104s 6d, a fine mark smalls 68s 6d, medium 93s 6d, bold 108s 6d, pea-berry 110s; *Coorg*, smalls 38s 6d to 57s, low middling to middling 50s to 63s, good middling 76s to 78s, good to fine bold 80s to 96s 6d, pea-berry 72s to 96s 6d; *Neilgherry*, smalls 40s to 45s 6d, low middling to middling 48s to 59s 6d, fair to good bold 67s to 87s, pea-berry 60s to 78s 6d; *Wynaad*, smalls 36s 6d to 42s 6d, low middling 45s 6d to 52s, bold 60s to 78s, pea-berry 63s to 72s; *Nainoobatum*, smalls 56s 6d, good middling 88s, bold 100s, extra bold 110s, pea-berry 111s; *Nelliampathy*, smalls 42s 6d, bold 74s.

MOCHA.—24½-frazils withdrawn.

JAMAICA.—248 barrels 470 bags partly sold as follows:—ordinary to good ordinary pale greenish 30s to 31s, fine ordinary 37s to 39s, fine fine ordinary to low middling 40s to 48s 6d.

COSTA RICA.—4,771 bags nearly all sold, smalls 47s to 64s 6d good to fine fine ordinary 36s to 46s, low middling to middling 50s 6d to 68s 6d, good to fine middling blue 69s 6d to 83s 6d, good to fine blue bold 92s to 102s, pea-berry 55s to 90s.

GUATEMALA.—2,458 bags mostly sold—smalls 37s to 37s 6d, fine fine ordinary to low middling 42s to 48s, middling 52s to 55s 6d, good middling bright greenish 61s 6d to 62s 6d, good bold colory 69s 6d to 81s 6d, pea berry 64s to 70s.

SALVADOR.—951 bags partly sold—low middling brownish 45s 6d to 46s 6d, middling colory 50s to 55s, good gray bold 61s 6d to 62s, pea-berry 56s to 60s.

NEW GRANADA.—499 bags partly sold—middling to good middling 49s to 57s, bold 60s to 67s, pea-berry 52s to 63s.

SAVANILLA.—71 bags sold—low middling to middling 48s 6d to 53s 6d, bold 59s 6d, pea-berry 49s to 54s.

NICARAGUA.—145 bags sold—low middling to middling 44s 6d to 54s 6d.

COLOMBIAN.—231 bags partly sold—small 42s 6d, good middling 64s 6d, bold 71s, pea-berry 66s.

TEA.

INDIAN.—About 8,000 packages, a large portion of which consisted of Calcutta-bought consignments, were brought forward, against 15,200 packages last week, and 17,600 packages a year ago.

This small quantity passed with a strong demand for grades under 8d per lb., which were at times slightly dearer, but for others, unless possessing special point, there was as a rule less competition, and prices favoured buyers, many lots being withdrawn owing to low offers.

Nearly 1,000 packages from South India were included in the catalogues and received good support, quality on the whole being useful. The present state of the market is favourable to these growths as the produce of some estates is realising 1½d to 2d per lb over this time in 1898.

CEYLON.—Sales were heavier, totalling 29,300 packages compared with 22,300 packages on the 9th instant, and 20,800 packages in the foregoing year.

There was spirited bidding for tea up to 7¼d per lb., which sold at fully former rates. At and over 7½d per lb., however, better value was to be had, especially in Orange Pekoes, many of which did not bring more than the Pekoes in the same invoice. Broken Pekoes continued depressed and results were very unsatisfactory, particularly in the case of parcels drawing thin infusions which the Home Trade find unsuitable to their requirements.

JAVA.—Rather over 4,000 packages of direct import were submitted. The selection represented most of the favourite gardens and commanded attention, quotations generally shewing very little change. A small lot of 19 boxes of Flowery Pekoe from the Nangoeng Estate fetched 1s 11d per lb.

Deliveries.—The clearances of all tea (on which duty has been paid) from the London Warehouses, as per official returns, were:—

From 1st to 6th May, 1899 ... ... 7,975,710 lbs.
" " 1898 ... ... 9,338,524 "

During the week the following have been printed for sale by public auction:—

	Sold. Pkgs.	Withdrawn Pkgs.	Total offered. Pkgs.
India	6,824	1,094	7,918
Ceylon	26,517	2,781	29,298
Java	3,595	336	3,931
Total .	36,936	4,211	41,147

Also 813 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated May 19th, 1899, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON
FROM 1ST JUNE TO DATE.

	Indian	Ceylon.	Java.
1898-1899 ...	1,554,759 pkgs.	1,090,730 pkgs.	48,556 pkgs.
1897-1898 ...	1,566,395 "	1,150,783 "	42,375 "

8,932 pkgs. Indian
29,750 " Ceylon
3,931 " Java
} Total 42,631 packages were offered in public auction this week.

The following quantities of Indian and Ceylon Tea were taken by the United States and Canada during the first three months of each of the last five years. The figure for 1897 is unusually large, owing to the fear which then existed of an alteration in the Tea Duty. It is possible that the slight reduction in the first quarter of 1899 may be due to recent high prices.

1899.	1898.	1897.	1896.	1895.

Total lbs ...	1,483,947	1,809,283	1,758,365	1,050,884	714.168

Indian. With further diminution in the quantity brought forward there was a distinct improvement in the demand, the auction passing very steadily at prices fully up to last week's rates. The official telegram gives exports to U. K. for first half of May as lbs. 2,220,000, against lbs. 697,000 and from the 1st of April to 15th instant, as lbs. 2,992,000, against lbs. 1,107,000 same period 1898.

Total Tea sold on Garden Account, 1st June to date 1899, 1,149·174 pkgs., av. 8 79d. 18. 8—130,694 pkgs., av., 8 65d.

Comparative prices of Indian Tea in London.

Ceylon. The week's auction was comparatively heavy, probably owing to the pressing forward of some Teas in view of the Whitsuntide holidays The market stood the strain well for all Teas under 7½d. per lb., which were readily disposed of at firm prices; rates for Teas over this figure were slightly easier, competition however being more general. Private telegraphic advice gives the quantity exported to U. K. for the first half of May as lbs 4,100,000, against lbs. 3,500,000 last year, and estimates the quantity for the month as lbs. 10,000,000 against 9,000,000 shipped in May 1898.

Avg. for week 7·99d., against 7·78d. same period 1898.

Ceylon Tea sold on Garden Account, 1st January to date 1899, 399,452 pkgs., av., 8·41d. 1898—437,275 pkgs., av., 7·64d.

Comparative prices of Ceylon Tea in London

	1899	1898.	1897.	1896.
PEKOE SOUG (Ordinary leaf; fair liquor)	7¼d.	6d.	6¼d.	7d.
PEKOE (Ordinary leaf, little twist; fair liquor)	7¾d.	7d.	7d.	8¼d.
PEKOE SOUG (Rather bold leaf; indifferent liquor)	7d.	5d.	5d.	5¾d.
PEKOE (Somewhat bold leaf; indifferent liquor)	7¼d.	5½d.	5¾d.	6½d.

Java The selection was large and varied, comprising a number of good liquoring invoices. Competition for all descriptions was strong; Teas under 7½d. were, if anything, slightly dearer.

Bank rate 3 per cent. Exchange on London three months' sight:— Calcutta $1/4\frac{5}{32}$. Colombo $1/4\frac{5}{32}$.

COCOA.

The tendency of prices continues strongly in favour of buyers, and Importers have at length given in to the inevitable, apparently. At public sale on Tuesday the small supply of 2,398 bags was offered, of which rather more than half sold at further declensions in value. Of 474 bags Trinidad brought forward 360 bags sold at 69s to 73s 6d for good to fine red, and 62s to 65s for blacks being slightly below valuations. Of 698 bags Grenada offered 550 bags sold at a fall of 1s to 2s per cwt, viz., fair to fine red 64s to 67s 6d. 21 bags Jamaica partly sold at 63s 6d, which price was also realised for 6 bags St. Lucia. 5 bags Dominica brought 64s to 64s 6d. Of 724 bags Guayaquil offered 200 bags early Arriba were quitted at 71s—a considerable decline. 3 bags common Surinam sold, out of 59 bags offered, at 64s. 11 bags sea damaged Bahia found a buyer at 64s. Ceylon's offering comprised only 391 bags, of which only 60 bags were placed at a further fall in value, viz., fine bold and medium red 73s, good pickings 60s 6d, blacks 47s 6d to 55s per cwt. Private sales include 500 bags Guayaquil Caraquez at 67s to 69s, and about 200 bags Ceylon at 68s to 71s per cwt.

GINGER.

Cochin.—There has been some pressure to sell, and auctions registered a fall of 5s on medium cut and 1s 6d per cwt. on small, washed rough being only a little easier. Catalogues comprised 295 cases 909 bags, of which 87 cases 160 bags sold in the room as follows:—Heavily limed medium roughly cut 45s to 45s 6d, good small cut ditto 28s 6d, bold and medium Native cut 41s, dullish to fully fair medium and small washed rough 22s to 22s 6d, good ends ditto 19s 6d. fair brown Calicut sorts 22s, common small and ends 18s to 19s, lean shrivelled to fair pickings 16s to 18s, cuttings 17s per cwt.

Bengal.—100 bags bought in at 21s per cwt.

Japan.—100 bags ordinary leanish limed sold at 17s per cwt. which was cheap, but privately 200 bags fair sold at 19s per cwt.—a full price.

Jamaica quiet but steady for all except the best qualities which were rather dearer. 319 barrels offered and 105 barrels sold as follows:—good plump bold bright washed 77s 6d, medium and boldish ditto 67s to 72s, dull medium lean and brownish 60s to 64s 6d, ordinary lean small and dark 54s to 58s, mouldy ditto 52s to 52s 6d per cwt.

PEPPER.

Black.—There has been a firm market this week, and a good business has been done in Singapore at an advance of $\frac{1}{16}$d to $\frac{1}{8}$d per lb.—at 5$\frac{3}{8}$d for fair on the spot, at 5$\frac{7}{32}$d April-June shipment, at 5$\frac{9}{16}$d May-July, at 5$\frac{5}{8}$d, June-August, and at 5$\frac{5}{8}$d July-September, also some business for July delivery at 5$\frac{1}{2}$d. In all about 400 tons sold.

At auction on Wednesday 22 bags damaged Singapore bought in at 5$\frac{1}{4}$d, and 199 bags Tellicherry at 5$\frac{3}{8}$d; also 410 bags Penang. 10 bags bold washed brown Ceylon found a buyer at 6$\frac{1}{2}$d per lb.

The shipments of Black Pepper for the first half of May compar as follows:—

		1899.	1898
U.K.—Sing.	20	100	70 / 260 } 330
„ Penang.	80		
Continent		100	*nil*
United States		20	*nil*
Total tons...		230	330

White.—The market is also dearer, with sales of 150 tons reporte including Singapore July-September shipment at 8$\frac{13}{16}$d, and Penan July-September at 8$\frac{3}{16}$d. About 700 to 800 bags of the latte description have been sold on the spot at 7$\frac{7}{8}$d to 8d for fair, also small quantity of Singapore at 8$\frac{9}{16}$d for fair.

At public sale on the 17th instant 18 bags Singapore, 26 bag Siam, and 126 bags Penang all passed the hammer unsold. 14 bag Ceylon realised 8$\frac{1}{4}$d for good brownish and 7$\frac{7}{8}$d per lb. for brown.

The shipments of White Pepper for the first half of May compar as follows:—

		1899.	1898.
U.K.—Sing...	*nil*	80	20 / 120 } 140
„ Penang.	80		
Continent		50	*nil*
Total tons....		130	140

CINCHONA.

The shipments from Ceylon for the weeks ending April 18 and 2 were 38,503 lbs. and 32,443 lbs., respectively, and from January 1 t April 25:—

	1899.	1898.	1897.	1896.
Lbs.	239,719	284,371	209,745	255.614

The auctions to be held in Amsterdam on June 8 will consist 4,342 bales Ledgeriana and hybrid, and 500 cases and 614 bal Succirubra. The stock in first hand at Amsterdam, on May 1 consisted of 2,228 packages Government and 5,800 packages priva bark, including the quantity to be offered in the above auctions.

QUININE.

The market at the end of last week closed dull, and no busine of importance was done on Friday or Saturday, the nomin quotation then being 1*s.* 3$\frac{1}{2}$*d.* per oz. for August delivery. C Monday a sale of 5,000 oz. was reported at this figure. The follow ing day witnessed a decline to 1*s.* 3$\frac{1}{4}$*d.* for August delivery, a 1*s.* 3*d.* for spot, at which figure a fair amount of speculative busine was done. The market slightly recovered on Wednesday, wh small shipments of bark from Java for the first half of May we announced, and some 50,000 oz. changed hands at 1*s.* 3*d.* for spo 1*s.* 3$\frac{1}{4}$*d.* to 1*s.* 3$\frac{3}{4}$*d.* for August, and 1*s.* 3$\frac{1}{2}$*d.* per oz. for Octob To-day 1*s.* 3*d.* had been refused for spot, but little business has be done. The makers report a fair consumptive demand.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittance, should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday the 23rd instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Coorg.

Polli Betta, 14*th June.*—*Weather.*—Monsoon set in here in earnest on the afternoon of the 11th. About ·70 in. that day; ·60 in. the next day. Yesterday the rainfall was very heavy amounting to 1·50 in., most of which came down in the evening. *Crop.*—Estimated at from 1 to 1½ cwts. per acre! Going to be one of the worst years on record. *Plant diseases.*—Removing borer nearly all completed. Coffee looking very fine everywhere. *Labour.*—Plentiful. *General Health.*—Good. *Prices.*—Gram Rs.5-6 per palla. *Ragi,* 20 seers the rupee. Rice, 10—11½ seers per rupee.

DRAFTS ON TEA SALES IN LONDON.

The Associations that represent the Indian and Ceylon Tea industries in London have long shown a determination to do all in their power to bring about a reduction of the charges incurred in putting tea on the English market. They are hammering away at this matter now with revived vigour. Owing to the serious decline in the prices of tea, the London charges now represent a very formidable percentage on its value. The Tea Clearing House Committee meet this statement by saying that, since the present rates for landing, storing, bulking and handling tea were fixed, wages, cost of materials, rents. rates and taxes have advanced considerably. An understanding between the two parties has yet to be arrived at. Meanwhile, however, the Associations referred to have turned their attention to the draft allowances on tea. In a circular (which was published in our issue of 27th ultimo) they ask for the support of producers in an attempt to secure the abolition of the draft allowance on teas sold in London. They remark that, owing to the narrowness of the present margin of profit on tea

cultivation, every item of expenditure has to be curtailed to the very lowest limit, and that this pruning process must now be extended to unnecessary charges and allowances on teas in London. The "most obvious" of these is, they assert, the allowance of one pound draft per chest or half-chest. This represented last year 2,720,000 lbs. of tea. The circular also states that "by the present system of weighing by H. M. Customs, a turn of the scale is given in the buyer's favour on the gross weight and another on the tare weight." Putting the above together, it is estimated that during last year the buyers received 5,000,000 lbs. of tea more than they paid for. The Associations do not ask for any alteration in the system of weighing, but simply that the draft allowance should be abolished, and they make a point by stating that in 1890 all draft allowance was abolished on cured provisions and cheese, and the same has been done in the case of bark and other articles.

It was not to be expected that the proposal under reference would be readily accepted by buyers of tea in London. It is but natural that it should have aroused grocers and others, and that criticism should have assumed various shapes. Only in its infancy at present, it will probably soon assume much larger proportions; but care has already been taken to represent that there is "another side" to the picture given in the circular issued by the Indian and Ceylon Tea Associations. A reference made to the London Wholesale Teadealers' Association brought forth a statement that only an informal intimation had been received that importers were considering this question. The Secretary wrote to the inquirer:—"If you would be good enough to advise me, when you know that the importers have really decided upon taking such an objectionable step, I will immediately place the matter before my Committee, who will, I am sure, take prompt action to protect the interests of the trade. The subject is of special importance to the retail grocers, whose Associations would no doubt render valuable assistance in resisting any change in the old custom as regards the 1 lb. drafts. The attempt was defeated many years ago, and by united action will, if necessary, be successfully opposed again." This is a very confident statement; but, however much of bravado it breathes forth, it at least shows that strenuous opposition may be expected. Again, the Bristol Grocers' Association has taken the matter up very energetically. At a recent meeting it passed unanimously a motion—"That the members of this Association, having been informed that the Indian Tea Association and the Ceylon Association are entertaining a proposal to abolish the draft allowance on tea sold at public auction, are of opinion that such a proposal is highly detrimental to the interests of the trade generally; that as the custom has now been recognised in this country for so many years, the Bristol Association fail to see, without some justification for the proposed procedure, why the present custom should be abolished; that some sixteen or eighteen years ago the Indian Association endeavoured to institute a similar course of action, but were defeated; that as chests and half-chests of tea are received in such varied conditions, it would, in the opinion of this Association, be an injustice to the trade to allow the present proposal to become effective, and this Association therefore earnestly pray that the above-mentioned Associations will take into their prompt consideration the advisability of not stultifying so important a trade by the abrogation of the time-honoured draft allowance, which does not more than cover the incidental losses arising i transit, cooperage, and leakage." It was pointed out that, the pound draft on the chests or half-chests were abolished it would mean often that grocers would not have the te they really paid for, as loss always occurred in transit.

In this last sentence lies the key to the distributors determination to have the draft allowance continued. The want to receive, at their own places of business, as muc tea as they pay for. Naturally, they not only state thei own case, but assail that of their opponents; and the circula mentioned gives them certain opportunities of which the have been quick to avail themselves. As the *Grocer* remark the statement that the draft allowance "is a survival fro times and conditions which no longer prevail," implies als that there is a long established custom, and this is not t be lightly set aside. The planters' desire for a change i attributed to the cause mentioned in the circular, *viz.*, "th profit on tea cultivation having reached such a narrow margin," and the *Grocer* remarks:—"The growers i India and Ceylon have cut down there, and are now wish ful to cut down here. We should not have thought th Indian and Ceylon trade had been really so bad as all that though we can quite understand why cutting down shoul be attempted if people find themselves, or think themselves strong enough to do it. For our own part, however, w are bound to remember the other parties concerned, an we find the Bristol grocers asserting that the draft allow ance, which it is proposed to disallow, does no more tha cover incidental losses suffered by the buyer in transit cooperage, and leakage." This is the point the Associa tions will have to meet. As a matter of fact, we think i of little importance whether there is a draft allowance o not. The cost of conducting sales of tea is so much; th cost of transit is so much; there must be a certain wastag on the way. No matter who appears to bear these charge or this wastage in the first instance, when the selling pric between importer and wholesale buyer is adjusted, the eventually fall on the consumer. Fix charges and allow ances how one may, the prices referred to will, in course o time, adjust themselves according to the immutable law of demand and supply. The prices hitherto paid hav been reckoned according to the scale of charges and allow ances in force; if the scale be altered, so will be the syste of reckoning and, consequently, the prices.

COFFEE AND TEA AT HAMBURG.

The latest British Consular Report issued from Hambur states that the fear entertained by many persons that th further over-production of coffee in various countries durin 1898 would be attended by a further decline in prices, a well as the hopes of others, who thought business woul take a more favourable turn last year, were not realise in the market under reference. The fluctuations in pric were only of a limited extent, but, on the other hand, th low quotations left hardly any margin for profitable bus ness. A natural consequence of the low price of coffee i 1898, as in the preceding year, was its largely-increase consumption in Germany as well as in other countrie though the import duty in Germany, it may be added, i comparatively high, and thereby still renders the sale o cheaper substitutes possible. The following figures show

the comparative consumption in Germany of coffee, cocoa and tea per head of the population since the year 1870, *viz.* :—

Annual average of—	Consumption per Inhabitant of Germany per annum.			
	Coffee.		Tea.	Cocoa.
	lbs.	ozs.	ozs.	ozs.
1870—75	4	13·5	·7	1·7
1881—85	5	3·4	1·	2·1
1886–90	5	1·1	1·4	3·5
1897	5	6·565	1·7	9·4

The total importations of Coffee to Hamburg-Altona in 1898 amounted to about 3,930,000 cwts., as against 3,720,000 cwts. in the preceding year. The stock on hand, in this and other markets, has now increased to a figure never experienced before, inasmuch as consumption, though increasing, cannot keep place with the vast production of the past two years.

Business in Tea at Hamburg was limited to about the same extent as in 1897. It is considered that the mild autumn and winter of last year was unfavourable to the increase of tea consumption in Germany and Austria. Statistics showing the quantities of tea imported are not yet available; but it is stated by competent authorities that the importations of Indian and Ceylon teas were in excess of those during 1897, and the consumption of these sorts appears to be developing, though slowly, also in Germany. It is, on the other hand, also thought that the present efforts towards exploiting and developing the resources of China are likely to lead to the resuscitation, by European assistance, of the cultivation and export trade of Chinese teas at a near date.

COFFEE, TEA AND COCOA IN HOLLAND, 1898.

Coffee.—The total importations of coffee into Holland in 1898 were, as nearly as possible, the same as in the previous year, amounting to—

From	Quantity. Bags.
Dutch East Indies	572,279
Santos and the West Indies	900,591
Total	1,472,870

Prices did not fluctuate much from the low figures with which the year began, and the large importation kept the trade dull and depressed. Good ordinary Java dropped at once from 60/6*d.* to 59/6*d.* per cwt. in February, recovering in September to 60/6*d.*, but closing in December at 54/7*d.* per cwt. Santos coffee was in dull demand, but the low prices have caused this quality to replace the dearer Java sorts more extensively year by year. Prices followed the course of the market in general, dropping from 37/6*d.* to 33/*d.* per cwt. in December. It may be assumed that these figures represent the lowest point likely to be touched, since lower figures must check importation.

Tea.—The importation of tea in 1898 amounted to 67,361 chests of Java tea, 3,346 chests of China tea. The Java article continues to take the place of the good ordinary China tea, and the importation and consumption steadily increase. The average figure reached in 1898 for Java tea was 5$\frac{5}{6}$d. per lb., and there were but inconsiderable fluctuations during the year. Business was fairly good, and prices improved towards the close. The quality of the Java tea is said to be very similar to that of the Assam leaf. The number of new tea plantations in the Preanger district of Java is increasing.

Cocoa.—Holland imported in 1897 from Java 15,000 tons of cocoa, against 11,367 tons in 1896. Only 1,000 bags were received last year from Surinam, so that the trade with Holland has now nearly reached that with Great Britain. Prices were firm throughout the year with an upward tendency, the stocks held by the manufactures of cocoa and chocolate being comparatively small Quotations for good Java varied from 65/3*d.* to 79/3*d.* per cwt.

TEA FROM SEED TO CUP IN SOUTHERN INDIA.

(By Thomas Brown, Glendale Coonoor.)

II.

The Seed.—Tea plants are invariably raised from seed, of which there is at this time of the industry a full supply, at from 30 rupees to 100 rupees per maund of 82$\frac{2}{7}$ pounds (the maund being known as "the Bengal" as distinguished from the Madras maund of 25 pounds and the Bombay maund of 28 pounds).

In the tea-fever days tea seed was sold at from Rs.200 to 300 a maund, and was so badly handled that frequently but 3,000 to 5,000 unhealthy seedlings were all that was obtained from one maund.

Picking of Seed.—It is difficult to distinguish ripe from green pods, and as the seed must be gathered from the trees before the capsules burst and the seeds fall to the ground, it too often happens that immature seed is gathered, and weak sickly plants raised.

In shelling the seed, coolies are apt to use their teeth and knives, thus puncturing the shell and causing doubtful results.

A few well-trained women should therefore be employed on the important work of harvesting seed.

We cannot advise seed to be gathered off the ground, as they frequently get mouldy before being picked up, do not germinate well or healthily, (after the kernel has once shrunk), and you can never be certain of your jât, if other varieties are growing on the same slopes above your seed-bearers.

After gathering the seed, it should be placed for 48 hours in a cool airy place and then carefully shelled by hand. On no account should it be placed in the sun, to get the capsule to burst. After shelling, seed should be put down to germinate as soon as possible.

The same care in handling tea seed is needed as in the case of flower bulbs, to ensure sound healthy plants.

Germinating Seed.—There are various ways of germinating seed, but what we have found to be far and away the best is to mix the seed with fresh horse-dung and plant on an ordinary well-drained bed about 3 inches deep of seed.

The watering should be light and frequent. A layer of ferns or thatch over the bed is better than a pandal.

Planting-out into Beds.—The seed takes six weeks to germinate. The seed should be frequently turned over, after first signs of germination have appeared, and all seeds from which the radicle has come out, be planted into beds, 3 to 4 inches apart.

It must be particularly noticed that the young plant does not throw up its seed into the air as does coffee; but that root and leaflets proceed from the same point, the seed adhering to the plant like the shell to a snail, and that therefore the correct way to plant the germinated seed is with the crack or opening *horizontal*.

Coolies invariably stick the radicle and crack downwards and possibly more unhealthy plants with twisted roots arise from this mistake than from any other.

The number of plants from a maund of good seed carefully handled is 15,000 to 20,000—a maund of seed containing as many as 30,000 seeds.

Beds and andals.— The nursery beds for these are best made 4 feet wide, and any length down the hill, preferably from north to south, so that all the plants get a share of the morning sun. Low pandals, about 3 feet high are much preferable to higher ones, as wind frequently knocks the high ones down, they are expensive to construct and maintain, the morning sun cannot well be admitted to all plants and drip in wet weather is often so severe that the leaves become punctured and soil considerably disturbed.

Plants reared in high pandals are much drawn and do not succeed so well when put out as those reared in lower ones.

CACAO IN TRINIDAD.

The Superintendent of the Royal Botanic Gardens, Trinidad, writes :—I have to report the first fruiting of a tree of *Theobroma pentagona* in Trinidad. This species was introduced from Nicaragua in 1893, on Mr. Hart's return from a visit to that country. Plants were distributed to various cacao planters, and, in answer to a circular of enquiry recentlysent out, he finds that, while a few have done well, the majority are either dead, or doing badly. The following, however, was received from an experienced planter :— "The beans are very large, the skin is rough, thin and soft. There are some thirty pods of all sizes on the tree, but what is most remarkable is that every chirero (young pod) that comes out keeps healthy, and up to now I have not been able to find a single pod of any size blighted. The tree is strong and healthy, and from appearance very hardy : in my opinion will answer well here. I shall take great care to save every pod I can for plants." This letter confirms the experience of the Botanic Gardens, where the tree has fruited. It has proved a very acceptable addition to the kinds known in Trinidad, and, when better known and more widely distributed, will no doubt be very favourably thought of. Sufficient plants for an experimental row at St. Clair were raised from the one pod which was ripened, and these are now making healthy growth. Other rows of the white-seeded Creole, the Ocumare strain of Forastero, the Ceylon Red, and several grafted varieties, are under trial at that establishment also. The idea of improving the class of Cacao produced is to search out the varieties which give the largest crops and the best class of dried produce, and to propagate those by grafting.

Mr. Hart is glad to be able to put on record (he believes for the first time) successful results of Cacao grafting experiments, carried out during 1898. The operation presents no unusual difficulty. Grafting is effected by approach or in arching—a method which is by far the safest for all tropical plants, and so far it has been found that the union takes place in Cacao grafting with greater facility than with the mango or other trees. Grafting now makes it possible to propagate one desired variety, and to have that variety and nothing else upon an estate, instead of depending solely upon seedling plants, which are known, to vary iin so large a degree, and are know to produce at times varieties which spoil the samples of the better class of produce. It would not be a difficult matter, says the Superintendent, to show that an estate planted with superior grafted varieties selected from first-class estates would produce samples of Cacao that would be of the highest possible excellence; at least that is the general result in other cultivations where the practice of grafting is pursued, and it would not be easy to see why it should not be so in Cacao. The remarks of Mr. Hart and some of his colleagues on Cacao disease were given in these columns some little time ago; but he says, the Cacao pod disease is not the only thing which will blacken and destroy the pods. as there are several other causes which cause them to assume this appearance. It must not be assumed therefore, that because a pod goes black that it has an infectious disease. Neither is it to be assumed—at least for the present, that there is any connection between the Cacao disease of Ceylon, and the Cacao disease in Trinidad as this cannot be ascertained until the organization of the two fungi have been studied by expert Botanists skilled in the examination of microscopic fungi. It is quite possible, however, that they may be identical. The Trinidad disease, so far, is in no wise a serious matter, and the Trinidad planter may congratulate himself that it is no worse, and if it only enforces habits of cleanliness and watchfulness, and induces better cultivation, it may prove in reality to be a blessing in disguise. The planter, when treating these diseases. must not trust to his eyesight alone for that is not a sufficient or sure guide, as the character of the organisms causing such diseases cannot be detected without the aid of a compound microscope of high power.

WILL CHINA'S RIVALRY REVIVE?

Lord Charles Beresford's account of the mission entrusted to him by the Associated Chambers of Commerce for the purpose of inquiring into the present situation in China, with especial reference to the condition and prospects of British trade in that country, has been issued in a volume with the title "The Break-up of China, with an account of its present Commerce, Currency, Waterways, Armies, Railways, Politics, and Future Prospects." From such a title one might expect a pessimistic account of the Celestial Empire, but to judge from the review of the book in the London *Times*, Lord Charles has taken a pessimistic view. China, he insists, is still sound at the core

Its people are industrious and submissive, though, when properly trained to arms, they are among the bravest of the brave; its native merchants are notoriously men of their word, and not without capacity and enterprise in business; but its rulers are corrupt, incapable, opposed to all change, impervious to new ideas, politically hopeless and effete. Hence, if the whole fabric of the Government could be re-organised, China might be regenerated. This "if" involves "a large order." no doubt, but Lord Charles goes on to suggest the various measures that he considers essential to the proper execution of that order. It must be borne in mind that he writes in the interest of British trade. He says in one place:—"The situation in China to-day bristles with international, commercial, and financial difficulties. British commerce, once the only occupant of the field, has now to face competition and adverse political influences, and if the sixty-four per cent. of British trade is to be maintained, and increased, our commercial classes will have to use all their energies and abilities to keep the flag of Great Britain in the front of commercial enterprise in China." Lord Charles asserts that the European nations should insist on a series of reforms in Chinese administration and finance, which are as necessary to China herself as to her foreign traders. These reforms may be epitomised thus:—

1. An imperial coinage.
2. Reform in the method of collecting the land tax.
3. Removal of restrictions on the export of grain.
4. Modification of the laws governing the salt monopoly.
5. The right of foreigners to reside in the interior for purposes of trade.
6. The registration and protection of trade marks and copyright.
7. The removal of the remaining restrictions on inland water navigation.
8. The abolition of the likin, or reforms which would ensure that likin should be collected once only.
9. Greater facilities to be given to *bonâ fide* foreign syndicates to work minerals.
10. The establishment of bureaux for the regulation of finance, railways, waterways, roads, posts, and telegraphs, and a bureaux to deal with all questions connected with trade. All of these are urgently needed, particularly for the postal and telegraph service, which are at present managed under a legalised system of squeeze. The foreign merchants constantly complain that the existing service is so untrustworthy that no letters between the ports are safe unless registered. The present telegraph service is so bad that a letter from Tien-tsin to Shanghai has been known to arrive before a telegram sent at the same time. The *Times* correspondent at Pekin told me that his telegrams very often cost as much to send from Pekin to Shanghai as from Shanghai to London.
11. One other bureaux is urgently needed, and that is a Trade Intelligence Department, to deal with scientific and practical questions relating to the natural products available in China for commercial purposes. What is an insignificant export to-day may become a valuable article of commerce to-morrow. There should be a scientific classification of the products of China on the same lines as the classification of products in India.

What all this may mean to Indian Tea, should the reforms suggested ever be carried out, we scarcely dare to speculate. Abolish the likin, stop the "squeeze" system, improve facilities of communication, and you put China in the right road to get ahead of India and Ceylon in the tea trade. It is to be hoped, therefore, that whenever—if ever—the British Government decides upon a progressive line of policy in respect to China, it will bear in mind that Exports and Imports are two very different matters, and will not once again sacrifice India at the altar of Lancashire.

THE QUALITY OF INDIAN TEA.

Some "country dealers" write from Bradford to the *Grocer* that the rage for years seems to have been, in Indian and Ceylon teas, to produce quantity, quality being a secondary consideration. The result has been to drive the demand principally on low and medium kinds; and undoubtedly these have been the best value to the consumer. They think there is a decided inclination by the public to give higher prices, if they could find the quality distinctly better; but when they find they can get nearly as good tea at 1s 8d. as at a much higher price, they naturally stick to the cheaper kind. These dealers say:—"The higher-priced Indian teas have a blaze of tip, and some of them have a thick heavy liquor, which, when drunk hot and strong, tastes of something, but if allowed to cool tastes very distinctly of nothing. The ripe, well-matured, juicy teas of a few years ago are woefully scarce, and we think the difficulty of the importers would be best got over by their producing some better stuff." Attend to quality and don't bother about draft allowances, is the gist of the advice here given to planters; and the remarks of the *Ceylon Observer* on virgin soils, quoted on another page, lend support to the idea that Ceylon teas, at any rate—if not Indian also—have deteriorated in strength and in flavour. That seems to us to be the most natural deduction from our contemporary's remarks, though, perhaps, it was not the one that he desired to suggest It is a deduction that is in very unpleasing accord with the above remarks of Bradford dealers.

TEA IN THE UNITED STATES.

We append two interesting letters, giving them in full in spite of the length of one of them, because they refer to an important subject and are from the pens of men who write with authority. The remark of Mr. Mackenzie, that "'Ceylon' must now be the prominent feature as 'India' has ceased subsidising—although still assisting in advertising" favors the view that India would do better to work independently. As for Mr. Pineo's letter, it sets forth very plainly the views of a man who holds, as we do, that the virtual withdrawal from the American campaign is premature, and a blunder that may lead to considerable loss of business that might have been secured had a bolder policy been continued.

[LETTER FROM MR. WM. MACKENZIE TO MR. LANE.]

LONDON, May, 17.

DEAR LANE,—I have yours of 4th. I have already written to you, mentioning the very sum you suggest as what should be spent in America next year It would be chiefly in subsidies and demonstrations, as we could not also keep up the advertising with that amount

When writing to you about what I saw in Germany, I forgot to mention that the indefatigable Yankees have got hold of the banks of the Rhine. Sailing down one sees huge wooden placards, on the most prominent point of the famous "Castled Crags" with "Eat Quaker Oats" in very large white letters "Nothing is sacred from the sapper" may well be applied to the Yankee. I could not help wishing it were "Drink Ceylon Tea." An investigating Committee has been appointed in the States to enquire into Food Adulteration: some of the evidence is startling. Cheap as coffee is, it is manufactured in large quantities of flour paste, &c., pressed by machinery into the shape of coffee beans. I send two notices with our advertisement on the subject. I have arranged for a large advertisement to appear when tea is examined, provided ours are found

pure. In one of the cuttings sent, you will see something about the green colouring matter used in some tea. I enclose one of Finlay, Muir's Seeta Ceylon advertisements. Also a letter addressed to the ladies of Canada by the Blue Ribbon Co. (Galt & Co.)—one of those firms specially induced to help us in Canada last year. I also send you in separate envelope a list of the papers in which they are advertising and copies of the advertisements which are striking. They have sent me a huge box of newspapers with the advertisement, for which I had to pay 10s. cartage, &c. One likes to keep an eye on all our friends, and this was their crushing reply to a suggestion from me, that I would like to know what they were doing.

I send also a lot of our advertisements and those of others from recent *Canadian Grocer* papers, as you said lately in one of your letters that you took an interest in them.

Read the articles in *New York Herald* showing how politics come into every thing, and the lengths in robbery, &c., one may go, provided he has a strong political friend.

There is an immense number of things one has to watch, follow and keep in touch with. This is more difficult now, that Blechynden is no longer on the spot and working with us. I may have to go over in June, but I won't unless actually necessary, as I do not wish to put the Committee to the expense. In July and August we will, as last year, practically stop, although correspondence is incessant. However, there will be neither salary nor travelling expenses.

I am giving our allies the hint that "Ceylon" must now be the prominent feature, as "India" has ceased subsidising—although still assisting in advertising.—Yours truly,

(Signed) Wm. MACKENZIE.

[From Mr. Pineo to the Colombo papers.]

Sir,—In its Editorial of the 30th ultimo, in *re* "Our Staple and Foreign Markets," the *Times of Ceylon* suggests matter, both seasonable and comprehensive, for thoughtful, deliberate consideration, and all interested in our staple should give heed to it.

My object in now addressing you is for the purpose of again begging that greater concentration of effort be given to the markets of the United States where ground has been broken, but not yet thoroughly cultivated, and from which only a small harvest can, at this stage, reasonably be expected.

The Acting Secretary of the Indian Tea Association declares the operations in America "have admittedly been successful."

This satisfactory outcome is the result of work inaugurated and executed by Mr. Blechynden, who is deservedly entitled to great credit for satisfactory labour performed prior to, and during the opening of, and also subsequent to, the closing of the Chicago Exposition.

Mr. Blechynden was wise to study American methods, quick to accept ideas that gave promise of aiding him in accomplishing his designs; and the success he achieved was, in a measure, due to his power of assimilating what he felt would bring satisfactory results.

Ceylon is now to be congratulated on gaining the active aid and experience of Mr. Blechynden, as his services have been secured by the shrewd, progressive firm of Messrs. Whittall & Co., of Colombo, whose interests he will guide and advance in America.

The plan for the expenditure of the money voted for next year has not yet been disclosed to the public; but it will, doubtless, be largely on lines laid down and recommended by Messrs. Blechynden and Mackenzie, who, it is to be hoped, will not base their plans on a system of subsidies, which system can only be entered upon when guarded by conditions so stringent that no firm of high and honourable standing will care to accept. At best, this system is a poor make-shift affair, vicious in its bearings, and susceptible of great abuse, and ending—usually—in dissatisfaction, loss and calumny.

It may be accepted and recognised as a fact that both the American and Canadian consumer give the preference to Ceylon pure teas, and take to them more readily than to the teas of India, which are, however, used in larger proportions than Ceylon's for blending with and fortifying inferior teas of other countries.

My contention is that Ceylon has done but little more than tickle the ground in the United States, and that more aggressive work is demanded; while no thought of decreasing our efforts should—for a moment—be entertained.

A population of 75,000,000 people, increasing steadily and rapidly, cannot be reached without a protracted and vigorous siege. The people who drink tea are not those who dwell in large cities, but they who live in the smaller towns, villages, and country, many of whom use it three times a day, while the majority of them never saw Ceylon tea! How is it proposed to get at this class? The retailer is the only medium that can be used, and he is the one to be helped. If, when granting a subsidy to a wholesale man, it can be arranged that a portion, at least, goes to the retailer,—the latter will have an incentive and will, probably, do good work; otherwise he will have nothing to gain, and much cannot be expected of him. A plan for reaching the real consuming class was submitted by me, but its very simplicity has, most likely, caused it to be received with disfavor, and yet the plan is a good one and can be elaborated and improved upon and made more workable.

Canada is not nearly conquered; but it is fast coming into line. The lower or Maritime Provinces use nearly six pounds of tea per head per annum, whereas the upper Provinces only consume about three pounds.

The merchants of the Maritime Provinces have begun an aggressive campaign and our interests will be actively advanced by them, but, in the Upper Provinces, and in the Great North West, where large numbers of Russians are now settling, much remains to be done, and this work, we hope, will be conducted, with spirit and energy, by the merchants, who, however, should be assisted in every possible way, that may be considered advisable.

In Mr. Renton's guiding hands we can confidently and safely leave our interests in France, Germany, Austria, Italy, and the lesser kingdoms of the Continent; but in Russia we have much to do, and our efforts should be largely directed to securing a reduction in the duties on tea, so as to bring our tea within the reach of the masses of the people. This must, of course, be done by the aid of the Imperial Government, and through the devious, delicate channels of diplomacy; but it is a matter of vast importance to Ceylon, and hence should be constantly kept in view.

In order to reach the acme of success, Ceylon must continue to agitate, be aggressive, and, in some form, advertise. Now the principal objects to be striven for in advertising are to attract, impress, convince and convey to the mind something that will long be remembered. Having these matters constantly before us, we must study just what kind of advertisement will be best suited to our purpose and what mediums shall be used to reach the people we want to capture.

Nowhere is the art of advertising studied with greater fidelity and assiduity than in the United States, where men make it a vocation and give their undivided attention to it, and where they are a highly paid and absolutely necessary part of every establishment that seeks the purchasing public

Advertising that brings results must be bright, alert, aggressive and constant, and its main object, as before stated, should be to attract and so impress the reader's mind that he will remember it. No ordinary advertisement will do this, nor will a lack of persistent effort ever lead to success. Jumping or making a spurt and then easing off will not accomplish anything permanent, and this leads me to conclude my little say by imploring the "Thirty Committee" not to contract, but, on the contrary, to expand and increase its efforts in the United States, where a rich and satisfactory harvest may in time be secured, if cultivation of the ground be persistently conducted and uninterruptedly maintained.

Pears' soap has made a world-wide reputation and can be found in every first-class drug store in the World, and yet its owners go on increasing their advertising expenditure and effort every year, and that, too, in all parts of the globe. In the United States, the Royal Baking Powder Company—long established—spend something like a million dollars a year in advertising and making demonstrations, and yet no Grocery would think its stock complete without this article. Baker's cacao has been known for nearly a century, but the Company spends more and more money every year in advertising, and at the principal Food Exhibits in the country this cacao can be found in its attractive booths. The managers of these profitable concerns know that without constant, increasing advertising effort their business would decrease in volume and in amount. "Our own and only" Lipton's furnishes us with an object lesson, and where can a shrewder or more successful advertiser in modern, up-to date business methods and management be found?

If we want to succeed we must advertise, and if we advertise it is our bounden duty to learn how, when and where to advertise.

Circulars are mediums of waste land, no one in America heeds them. Advertising in the plethoric Sunday papers issued in the large cities of America is absolutely futile, and the same assertion is fairly applicable to the dailies—hence these mediums should all be rigorously excluded from any proposed plan.

As auxiliary to and part of my plan of demonstrations, which may be classed as one form of advertising, Cave's lecture on the buried cities of Ceylon, with its attendant paraphernalia, could be utilized and delivered before Lyceums, Lecture Rooms, and Church Vestrys, where the tea drinking class do mostly congregate during the long evenings of winter; then Ceylon tea would become popularised and known far and wide. Many other forms of useful advertising might be enumerated, but enough for my present contention has already been said.

When we have succeeded in placing 25,000,000 lbs. of our tea in the markets of America, then, and not till then, can we lay back and let the merchant, in place of the grower, advertise Ceylon tea.

If, Mr. Editor, you consider this little pipe of mine worthy of space in your valuable journal, please give it room—you will know what to do with it; should it, in your opinion, be of doubtful interest to your readers—and if it will in a feeble way arouse the planters, for whom it is primarily intended, some good may emanate from its little wail.—Yours, &c.,

R. E. PINEO.

NOTES.

Liberian Coffee in Sylhet. This is said to be growing well.

Cardamoms. Latest advices from Home point to the probability of a further decline in prices.

Herb. Sap. In time of peace prepare for war. This pertains to battling insect and fungous enemies of agriculture as well as foreign foes.

China Tea for Russia. The Hankow market opened at very high prices for common teas. Out of 180,000 half-chests settled, 165,000 half-chests, were for Russia.

British North Borneo. Exports of Coffee from British North Borneo amounted to $29,278·67 in value in 1897, and $28,620·85 in 1898. Rubber increased from $49,513·86 to $79,600·29. Pepper from $895 to $1,760.

The London Tea Market. Reuter wired on the 8th instant that common tea was firm, while other sorts were irregular. Ceylons, Fair Pekoe Souchong 7s., average 7¾d.; 32,000 sold out of 35,000 offered. *Indians*—Average 7⅞d.—13,000 packages sold out of 16,000 offered.

Cheap Freights. Almost all the tea shipped from China and Ceylon to Russia goes in vessels of the Russian Volunteer Fleet. Not only are steamer freights low, but tea imported in Russian bottoms enjoy preferential railway rates between Odessa and Moscow.

Ceylon Tea in America. Messrs. Whittall & Co., of Colombo, announce the opening of a branch at New York under the charge of Mr. Blechynden. This is an indication that the time for relying solely on the American Tea Fund and Commissioners representing the whole planting community has gone by.

The London Tea Market. In a cable to Colombo, dated 9th instant, Messrs. Gow, Wilson and Stanton reported that the market was weak, and teas with quality showed a fractional decline. They quoted fair liquoring Ceylon Pekoe 7½d. (unchanged), average 7¾d. (¼d. down). Of 35,000 packages offered 32,000 were sold.

Calcutta Tea Sales. About 9,000 packages were offered and 8,000 packages sold at Calcutta on the 9th instant. A quiet tone prevailed throughout the sale; medium kinds were 3 to 6 pies lower, common 2 to 3 pies lower, and good teas firm at previous rates. It is curious that London reports of the same day report poor liquoring sorts steady and teas with quality lower in value.

Planting Districts revisited. A veteran Ceylon resident writes to a Colombo paper:—"How changed are the districts of Dikoya and Dimbula!—with all the timber trees growing up in ravines and along roads. I think it breaks the tiring monotony of all tea in a welcome manner. I know one planter who gets all his firewood from his grevilleas and gums, besides timber for lines, &c."

Peruvian Bark. In a German official report on the trade of Peru, we find it stated that cinchona-bark is not cultivated in the country but gathered in the forests. The export of the article has considerably diminished on account of its low price in the world's market. Probably also the wild bark of Peru is inferior to its cultivated rival of Java and India.

The London Market. Our reports this week are briefer than usual, for the Whitsuntide holidays had upset business at the time the mail left, and several sales had been postponed. This, we fear, has not been to the advantage of sellers of coffee, and planters here certainly needed all the advantage they could get. The break in the spice sales was probably good for all.

Duty on Coffee in Queensland. At a recent meeting of Queensland coffee-planters at Cairns it was decided to co-operate with the local Chamber of Commerce, thereby strengthening that body's hands, in obtaining an extra duty imposed on coffee introduced into the colony, thus protecting the locally grown article. The meeting was unanimous and enthusiastic, and is expected to bear fruit in the near future.

Colombo Tea Sales. At the sale on 7th inst. about 9,004 pkgs. = 684,205 lbs. were offered, of which about 7,500 pkgs. = 574,006 lbs. were sold. A much firmer feeling was noticeable at the auctions, says the *Times of Ceylon*, and prices generally were higher, except for broken pekoes, which were very irregular, and somewhat easier. Among the best teas in the sale were Middleton and Queensland.

Geography. The *Ceylon Observer* "lifts" a para chaffing the Yankees about "Russian Caravan tea" borne by camels passing the Pyramids (1)! and in the same issue announces, under the heading of "Ceylon tea for Russia" that the Hankow market has opened at high prices, and that large purchases have been made there for Russia. Seemingly, it is not only the *Yanks* that need to study Geography.

Enlarging as it travels. The *British & Colonial Druggist* says in its Indian Notes:—"Two or three tea planters in Madras, finding tea by no means as profitable as it used to be, have devoted several acres to the cultivation of roses, and are erecting apparatus for the distillation of attar. Roses of all varieties grow readily all over India, so it is surprising that the attar industry was not started here long ago." Neither true nor *ben trovato*. Roses grow readily *all over* India?

Tea at Batoum. A very considerable increase took place in the quantity of green tea that was landed at Batoum during 1898 in transit for the Russian possessions in Central Asia and for Bokhara. In 1897 the quantity was 1,330 tons; in 1898 the figures were 4,029 tons. From this it would appear that the overland routes, through Afghanistan and Persia, must have been practically abandoned by Indian Tea merchants, in favour of the sea route *viâ* the Suez Canal and the Black Sea.

Rubber in North Borneo. The *North Borneo Herald* says:—Mr. Harold G. Parsons, of Kalgurdie, West Australia, arrived in Sandakan on the 13th, and left on the 29th April. The immediate object of Mr. Parsons' visit was to take up land for the planting of India rubber and gutta on a large scale, and we understand that Mr. Parsons left the territory fully convinced of the feasibility of obtaining profitable returns from those products, and that he hopes to put the scheme into practical working order shortly after his arrival in London, whither he is now bound.

Coffee in the United States. The imports of coffee, as reported by the United States Treasury, for the nine months ending March 31, were 607,513,143 pounds, valued at $39,656,888. The exports of coffee were 22,934,454 pounds, leaving net imports of 584,608,689 pounds. Brazil furnished 477,072,485 pounds, or 78¼ per cent. of the total. During the ten years, 1880-1889, Brazil furnished an average of 50 per cent. of the total supply. Imports from the East Indies for the first nine months of the Government fiscal year were 8,293,768 pounds, against 12,571,590 pounds in 1898 and 9,886,124 pounds in 1897. There was also a decrease in imports from Mexico, as compared with last year of 7,492,958 pounds, but 341,827 pounds greater than in 1897.

Tea Blights. Writing from home, Mr. Carr thers, the cryptogamist who w lately employed in Ceylon, says:—I know Dr. Watt's publ cations *re* tea and other blights—he only compiles the things. Massee of Kew works at them and the dry pickled specimens don't give the best material for work consequently the 'grey blight' and many other fungi hav never been investigated and only one stage of their live described—their life history is unknown. I have her material which I collected, which I hope will enable me t give a more complete account of them, but have as yet ha no time to look at it.

Tea on Virgin Soil. Reviewing some recent remark of the *I. P. G.* the *Ceylon Observe* says:—"We have no hesitation in saying that there is large and reliable body of experience before us to sho that tea grown on virgin soil in Ceylon has produced a te greatly superior in flavour, if not in strength, to tea grow on land previously occupied by coffee or other product and that, as years rolled by, the tea even on virgin so gave a leaf which did not maintain its original reputation. Our contemporary adds that, though allowance may have t be made in some cases for "a virgin soil," a good dea weaker in one district than in others—yet to keep up tea t its pristine vigour the soil must be supplied in some wa with what it loses through successive, and, perhaps, heav crops of leaf.

Misapprehensions. That the critic ought to unde stand clearly before he attempts t criticise, may be seen from the report we give elsewhere a little friendly spar between the *Times of Ceylon* and th *Madras Mail*. How entirely the Colombo paper misread an consequently misled readers is shown by the following fro the *Observer*:—"The local *Times* last night discusses a Indian point of view of Europe and British grown tea, quo ing a long extract from the *Madras Mail*. It points out th disadvantages that would ensue for India should Sout Indian planters decide to start upon a 'tea-compaign' their own, as the journal quoted suggests *more especial in view of the supposed ill-feeling from Russia towards Indi referred to in the above extract.*" The italics are ours Read fairly, the *Mail's* remarks certainly contained n suggestion of even "supposed" "ill-feeling from Russi towards India."

"Male Coffee Plants." Referring to recent remarks o this subject in PLANTING OPINIO the *Queensland Agricultural Journal* states that Mr. J. M Bailey, Government Botanist in Queensland, says that n such a thing as a male coffee plant has ever come unde his notice, nor has it, to his knowledge, been mentioned b any other botanist. The coffee plant is neither dicœcious nor monœcious, but is *hermaphrodite*, the flowers co taining both male and female organs. Our contemporar remarks:—"As to a tree which bears peaberry beans considered a male, the idea is absurd. If the tree were male it would not bear at all any more than would a ma date tree. It is possible for the flowers to lose the fema organs, and for the tree thus to be barren; but still the could not be considered a male tree unless such a condit were ever afterwards its characteristic." These remark

suggest experiments in the line of producing a new "freak," a male coffee tree, but as the tree would be of no use there is not much inducement to planters to make the experiment!

The China Tea Season.

Reports from Hankow, dated May 18th, state :—The weather has been exceptionally fine during the interval, and teas have been arriving freely and all in excellent condition. Settlements have been on an extensive scale, but a very large quantity has yet to be reported. The quality of the *second packs* of Keemuns is good and they have met with ready sale, a few crack chops selling as high as Tls. 50 per picul. Ningchows have not been popular, and a decline of Tls. 3 to 5 has failed to bring about a general demand. The better kinds of Hankow teas have fallen Tls. 2 to 3 per picul, but the strong competition for common to fair grades below Tls. 20 has caused an average advance of about one tael on such kinds and the market is strong at the close. Nothing has been settled under *fourteen taels,* or the equivalent of 6½d. per lb. usual London terms. The S.S. *Glaucus* is circulated to *clear* on the 20th instant for London. She has about 5,000 tons brick tea on board for the Yenesi river, and takes the first of the new season's teas from here, estimated about two-million pounds.

Coffee in Cachar.

A writer in the *Planter* says :—Regarding coffee in this part of India "I hae ma doots." We have only about 200 bushes here in their fifth year, so that I am not qualified to form a very decided opinion, but I fear that the near future will see a heavy fall in prices of East Indian grades, which have hitherto held their own owing to the small supply from other countries of similar high quality. But now Nyassaland, Columbia and many other new sources are sending forward large quantities of very fine coffee, fetching indeed higher prices than East Indians. Our produce seems to be of the same type as the Wynaad, which I see from London reports is selling for, say, bold coloury 53s. per cwt., medium 48s. and smalls 40s., or, say, a crop average of 48s. I fear that it is not too pessimistic to suppose that the next two or three years will see the average down to 40s., and I confess that, at, say, 5 cwts. per acre of parchment, I cannot see where the profit comes in, even with the most economical management. It would be of much interest to many of the readers of this valuable publication if your Coorg correspondent would favour us with a statement showing actual expenditure on his own or other estates, and including cost of peeling, London, Calcutta, and freight charges. I recently received from Mr. Thiselton Dyer, of Kew, a pamphlet strongly urging the advantages of sending coffee to England, in the parchment, to be peeled there,—pointing out that, while the cost of peeling would be the same here or there, quality was gained by keeping it in the parchment during the voyage home; and that the consequent increase in price more than covered the extra freight charges. Besides the advantage of not requiring to sink money in the expensive machinery required for peeling, winnowing, sizing, and separation of peaberry.

Ginger

The *London Commercial Record,* commenting on the general dulness of markets, remarks that there is one article which, although still unripe for a boom, shows unmistakeable signs of slow recovery and which, is quite worthy of being carefully watched This article is Ginger, and to be more correct, rough Ginger. Our contemporary says :—"This year's season, which we may now consider closed, has been an exceptionally unsatisfactory one, for the boom which used to visit our market annually has this year been conspicuous by its absence. True, we have seen some sort of spurt, but it has hardly been deserving of the name of boom, and nothing like the usual quantities of Ginger have changed hands Prices have risen a few shillings, and not being supported, have declined to almost the lowest point they touched last year. Business has almost entirely been confined to cut assortments, very little rough unassorted Calicut and next to no Cochin washed being bought. The result is an appreciable decline in our stock of bag Ginger and some increase in that of cut descriptions. Deliveries, on the other hand, show a most satisfactory increase, and without laying ourselves open to the reproach of being sanguine, we feel convinced that if deliveries continue on the present liberal scale for a little while longer, our stock of rough Ginger will be reduced to as low a level as we have witnessed for a long time, for any large increase of our stocks by unexpected supplies in the shape of Native consignments is practically excluded. There has been nothing tempting in our market this year to induce Bombay dealers to buy up large quantities of Ginger for the purpose of trying the London market, and we may take it for granted that very little more will come forward. The recent heavy rains have greatly interfered with the preparation of Ginger, and this fact, together with the low prices ruling here, have a deterring effect on Bombay consignors. If a little later the statistical position of Ginger improves, the article will be worth the attention of speculators."

GENERAL ARTICLES.

QUALITY AS APPLIED TO TEA.

The application recently made before Judge Lacombe for an injunction against the Collector of the Port, the Tea Examiner, and the Board of General Appraisers, to prevent the rejection of certain teas which, it is asserted, differ in certain respects from the established standards and yet are equal thereto in purity, wholesomeness, and fitness for consumption and quality within the true intent and meaning of the act, has been denied.

It is claimed that the regulations of the Treasury under which rejections are made are illegal; that the true intent and purpose of the act is to prevent the importation of pure and unwholesome tea; that it is ridiculous and unreasonable to suppose that Congress intended by this legislation to permit the Secretary of the Treasury to determine the grade of tea which the American people were permitted to drink; that Congress could not confer upon the Secretary of the Treasury the power to declare what teas should be imported into the United States; that a wrong meaning has been given to the word "quality."

"The purpose of a standard is that there may be a fixed and stable measure by which similar articles can be tested, but if by the word 'quality' Congress meant to place it in the power of the Secretary of the Treasury to fix and establish the teas admissible into the United States according to their taste and flavor, then not only is it possible that the widest fluctuations may exist from year to year in fixing of the standards, but the determination of whether teas offered for import are inferior in flavor and taste to the standards so established must necessarily fluctuate with the varying skill or delicacy of taste of tea experts. It needs no argument to show that to subject an extensive trade in a commodity of foreign production

which must be purchased many months in advance of its arrival at our ports, subject to the variations of seasons, to entry under such a rule is to imperil all security of trade and to put the merchant under a hazard of loss for which there can be no compensation of gain to any other part of the community. For even if such a construction of the statute were not oppressive upon the importer, it would still be a harsh and unjust rule in its application to the consumer. It would exclude inferior grades of tea, although entirely genuine and wholesome, and would compel the poorer classes of citizens to purchase higher grades of tea presumably more costly and possibly less to their liking. To that extent it would interfere with the natural liberty of the citizen and the choice of commodities which it is the general policy of the law to extend rather than to restrict.

"If this be so the legislation is in the nature of a police regulation, and the word 'quality' is to be read as having regard to the tea as being fraudulent or deceptive or bad. The design of the statute, then, is to exclude 'impure,' 'trashy,' and 'unwholesome' tea.

"This in effect limits the word 'quality' by the purpose of the statute as we have claimed it, and by the words with which it is associated.

"The rejection of teas equal in purity, quality, and fitness for consumption because containing a greater mixture of similar teas broken up into fragments known as dust or fannings is unauthorized by the statute. The regulations provide that in certain standards the percentage of dust or fannings must be restricted to 10 per cent., and in others that the maximum of dust or fannings shall not exceed 4 per cent.

"It is entirely manifest that the inherent substance of the tea is not altered by its being broken into small fragments, nor is there any pretence that it is thereby rendered any less wholesome or fit for consumption. If these teas were properly rejected it must have been because the 'quality' refers not to the inherent substance of the tea, but to its size and packing. We submit that such a construction of the word 'quality' is inadmissible. It is strained and unnatural. It has no justification in the reason of the law or in the plain meaning of the words, and is merely a trade regulation absolutely unauthorized by the statute.

"The regulations require the rejection of teas not equal to the standards in flavor or cup quality, although equal to the standards in every other particular, and the defendants have applied and are applying that rule.

"The defendants having prevented the importation of teas which the plaintiff is entitled to import within the true intent and meaning of the act and threatening to continue to do so, should be enjoined from such unauthorized acts."—*American Grocer.*

ENEMIES OF THE COFFEE TREE IN B. C. AFRICA.

H. B. writes to the *Ceylon Observer* :—

BORER No. 1

After a coffee clearing gets a year old, be on the outlook for the longicorn beetles, for they emerge from their cavity in the trees of the forest and begin to fly about from the middle of November to the middle of March (practically four months), during which time they are maturing and laying their eggs ; and as sure as fate many will find their way into a coffee estate. When they find coffee, as they seemingly do, a palatable food, they live on the bark of the plants, and the female lays her eggs, usually from five to seven in number. From tree to tree she flies and lays only one egg, be it remembered, at the bottom of each tree in the ground (not as is usually supposed on the tree itself) about the size of a small canary seed, dirty-yellow in colour The egg soon hatches and finds its way, as a very diminutive grub, to the root of the coffee and begins to nibble at the bark just at the collar of the plant. Working its way in it soon has a covering nest protecting it from birds and insects ; ants even cannot get at it. In the course of a month or two, the forceps of the grub become strong enough to tackle the wood, which it burrows into and lives upon till fully matured, boring up or down the tree, turning out saw-dust and keeping its hole open to prevent suffocation till fully matured, taking about six months before turning into the chrysalis stage ; during this time he either kills the young tree outright, or damages it so much that it never recovers or makes a healthy tree afterwards. After the first rains in November o December the borer grub flies as a full-fledged beetle and havi found a favourite feeding and breeding tree in our coffee estat sticks to it and again begins egg-laying. Some of my planti friends may say, " Oh I have found half a dozen borers in one tr This may be so, but I challenge any planter to produce more th one borer in young coffee under two or three years old. It is wh an estate becomes a nursery for the longicorn and several beetl lay eggs at the root of a tree, that a number are found, or t same beetle may lay more than one on the same ground. for it la six to seven eggs ; but this is not likely, for it flies about at nigh seldom resting more than an hour or so, on one tree, although sometimes feeds a whole day on the same tree : I judge from t amount of bark eaten. I feel almost certain eggs are only laid night and not during the day time when the beetle is at rest a feeding or basking half-asleep on the sunny side of a coffee tree.

So much for borer No. 1. I shall now describe

BORER No. 2,

which comes from the larva of a yellowish white moth with st bars across its body, not so bright and visible as the Ceylon mot This moth lays its eggs, usually only one, in a little web on t leaf of a coffee tree about the month of January usually, and t egg soon turns into a borer which finds its way into the coffee tr by means of a puncture it manages to make in tender green wo either in a branch or the stem of the tree and works its way in the pith along the primary and down the stem making air holes it goes along (also pushing out saw-dust the same as the longico grub) till it reaches the root: only working in the pith, be remembered, till it forms a chrysalis in four to six months' tim This borer is not very destructive, and is easily discovered as t branch or top of the tree it enters by usually dies. I have nev found more than one in a tree. Both these borers I have seen Ceylon—the first called the white borer, and the other the red bore but the damage done was so trifling that they were hardly knov to casual observers. I was always fond of "poochi" catching a have caught many of the same stag beetles and moths in Ceylon.

WHITE GRUB.

This is the most common of all grubs, and perhaps does mo damage to young coffee than the borer. The beetle is chocol coloured, and the grub is white, and curls up when exposed on t surface of the ground This insect, unlike the borer, seems propagate all the year round having no set time of year for layi eggs and lying in the chrysalis stage, for I have found grub of sizes, and beetles, all in the same place, at the same time the form busy trimming the fibrous feeding roots of the coffee as fast as th are made.

BLACK GRUB.

This grub is very destructive, especially in vegetable garde It comes to the surface at night, cuts off coffee seedlings and ri larger plants at the collar and even goes the length of climbing a leaf occasionally. In the case of its feeding operations be disturbed by the break of day, it pulls the leaf into its hole und ground where it habitually descends to rest during the day ti I do not think this insect eats the coffee roots like the white gr but it does a tremendous amount of damage to nurseries and yo plants in a new clearing—this I am certain of. The moth of t grub is black with a torpedo-shaped body, prominent eyes, and f very fast; it appears just at dusk, darting about seeking food flower gardens and elsewhere and laying its eggs, but how man do not know, in November and December. The grub lives ab six months and then turns into a repulsive looking, glossy chrys with a hard shell, sharp-pointed at one end and twists about t sharp end when touched. Black soil rich in vegetable humus full of this grub and it is seldom found in poor land.

WIRE WORM.

This is the only other grub that attacks coffee to my knowl the beetle is small, about as big as an ordinary cleg-fly, and ha habit of pretending to be dead when caught. When turned on back he lies still for a short time till he thinks all danger is ov then arching his body by drawing together both ends, springs the air about a yard and lands on his feet and flies. I do not kn how long the grub of this beetle remains alive; but in one long enough. I have known one to kill out an "anona" (bullo heart) tree three years old—I should imagine about six mon He is not very destructive to coffee (in fact not at all comm but does a lot of damage to fruit trees and vegetables.

STICK INSECT.

This caterpillar cuts off the primaries and tops of coffee plants, and arranges them round its body length ways, binding them together with a strong, tough web. This house or shell it lives in, stretching itself in and out of it, according as required to enable it to walk about with its house on its back It does a lot of damage barking the coffee plants, sometimes ringing them right round, completely stopping the flow of sap; and it should be considered an enemy of our coffee and destroyed. This caterpillar lives from February to June in Nyassaland.

CRICKETS AND LOCUSTS

comprise a very large family indeed; but there are only a few that feed on and do damage to coffee and they are principally the green-backed, handsome fellows with yellow and blue rings round the body. They have stumpy wings and a hard, horny, sword-like beak. I don't think they fly, at least I have never seen them do so. These locusts do a lot of damage barking the coffee and may well be destroyed as an enemy of the coffee tree. Several others of the cricket locust family do some damage by cutting down small plants.

BLACK BUG

I have seen, but only on an individual tree or two; but it never spreads. It appears in February or March and disappears in May and June This pest, I am of opinion, is kept in check by the lady-bird beetle, which is common in the country and is seen very lively on our coffee bushes at the time black bug appears, and it is well-known it preys upon the bug family.

COFFEE LICE

I have seen covering an individual coffee bush, but like the bug it never spreads, and is probably devoured by some tiger of the insect family.

THRIPS.

During a very dry season it appears about October and disappears with the first heavy thunderstorms towards the end of November or early in December—much damage done by the sun and heat during these two months might be attributed to thrips. I don't think, however, that much harm can be done to our coffee by this insect, for the short time it is with us (and this only, to my knowledge, on two very dry years) that it can be considered very harmful or dangerous.

CEYLON TEA IN WAR AND PRACTICE.

Mr. R. V. Webster, the well-known representative of the Co-operative Tea Gardens Co., of Colombo, Ceylon, was in Toronto for three or four days this week. Mr. Webster every year makes a trip around the world in the interests of Ceylon tea, and is naturally, therefore, an interesting man to talk with, particularly as he is a good conversationalist and a keen observer of his surroundings.

He is at present making his tenth trip around the world. It was two years ago that he last visited Toronto, and since that time he has had some interesting experience aside altogether from his calling as a representative of Ceylon tea. Early last year, for instance, when he arrived in Egypt he found the British and Egyptian troops ready to ascend the Nile to crush the Dervishes, and, realizing that it might be a good opportunity to push his tea in that part of the world, he became attached to the expedition and was given charge of the civil transport service for the contractors. He subsequently became assistant to the officer commanding the army service corps, and still later was appointed by the Sirdar war correspondent for the *London Post*.

In his capacity as war correspondent he was present at the battle of Atbara, where about 3,000 Dervishes were killed and the British and Egyptian losses were 700 men killed and wounded. Mr. Webster has some very interesting snap-shot photographs taken upon the field of battle, some of which are gory and others humorous.

"I suppose some Ceylon tea was drunk by the troops?"

"Yes," said Mr. Webster, "the troops in the Soudan drank nothing but Ceylon tea."

"No coffee or spirits?"

"No coffee or spirits."

It may be mentioned that before returning home, Mr. Webster will again ascend the Nile, probably as far as Khartoum. This time his commission will be wholly commercial and not a combination of war and commerce.

It will be remembered that Mr. Webster was here two years ago. It was stated that he intended visiting, if possible, the tea estates in the Caucasian Mountains.

"I was told when I got to Russia," he explained, "that there was no possibility of my being allowed to visit these estates, as it was against the rule to allow foreigners to do so. I, however, with a great deal of persistent effort, succeeded in getting Mr. Popoff, the proprietor of these estates, to give me permission to visit them. I did so. A great deal of money has been spent on these estates by Mr. Popoff. Up to the time I was there, the amount he had expended was about $400,000. The estates are beautifully laid out in terraces."

"What do you think of the possibilities of these estates?"

"I do not think very much of their possibilities. The climate is too severe, and I noticed that the tea bushes were all stunted in growth. There is no fear of these estates producing tea in any large quantity. I tried to get them to give me some samples of leaf on the estate, but they refused my request. Fortunately, however, I had previously secured samples from Mr. Popoff, and these I forwarded to Gow, Willson & Stanton for valuation. They advised me that they placed a value of 6d. per lb upon them, which, I might state, was also my valuation. The workmen employed on these gardens are Chinese, who were imported for the purpose. The duty upon tea entering Russia is very high, but, on account of the conditions I have already noted, I do not look for any material development in the tea industry in that country."

Mr. Webster left Colombo on his present trip around the world in September last, and since then has visited many other countries—Australia, New Zealand, Samoa and the Pacific Coast States of the American Union. Among his selection of photographs is one in which he is taken with the rebel king, Mataffa. It might be incidentally mentioned that Mr. Webster considers that the quarrel of Mataffa is a just one, and that the British and American authorities are taking the wrong side.

"In your present trip, how have you found trade in Ceylon teas?"

"I found that the demand for our teas is increasing nicely everywhere, and I might tell you that six firms in Russia have appointed offices in Colombo, showing that that country is taking an increasing interest in our teas. Formerly, the Ceylon teas which Russia imported were bought in London, but now they are importing direct, finding it more advantageous."

"The tea conditions in Ceylon are becoming more satisfactory are they not?"

"Yes," replied Mr. Webster. "The year 1897 saw the lowest price touched in Ceylon tea, but now the conditions are becoming more favorable. The exports of tea from Ceylon up to April 12, 1899, were 1,248,000 lbs. short of what they were up to this time last year, and, with the increased demand from Russia, and, in fact, the Australian market and Europe, I fail to see why there can be any drop in prices."

Mr. Webster, after concluding business on this side of the Atlantic, will cross to England and will visit the continent, and, as already stated, will go to Egypt before he returns home.

Mr. Webster, who is managing-director of one of the new coffee estates in Queensland, Australia, reports that the coffee plants there are developing nicely, and that the first crop will be gathered the year after next.—*Canadian Grocer*.

TEA, &c., COMPANIES.

Cachar & Dooars Tea Co., Ld.—Profit £2.681-6-1; dividend of 3% recommended. Average prices—Silcoorie as. 5-4¾, as against as. 70- in 1-97; Matelli as. 6-8½, as against as. 7-2.

Bengal United Tea Co., Ld—Crop 26,692 mds.; profit £13,556-7-6; dividend on preference shares paid.

Lankapara Tea Co., Ld.—Outturn 696,890 lbs., average price 7½*d.*, against 7½*d.* the previous season. Profit £4,283-7-5. Dividend 8%.

Aibheel Tea Co., Ld.—Crop 311,070 lbs., average price 6¾*d.*, against 7⅜*d.* the previous year. Profit £1,075-6-1.

Jhanzie Tea Association, Ld.—Outturn 937,470 lbs Profit £2,525-9-5. Final Dividend 3%, making 5% for the year on ordinary shares.

Bargang Tea Co.—Crop 395,438 lbs., average price 9¼*d.*, against 9 1/16*d.* in 1897. Profit £3,600-14-1. Dividend of 3% recommended.

HIGHER PRICES ON TEA IN CANADA.

There has been an active movement in tea during the past ten days at Montreal, especially in China and Ceylon stock. In the latter, round quantities have changed hands around 17c., and the fact becomes interesting when it is learned that the identical lots of tea sold about three months ago at 13c., so that the sales stand for a rise in price, in the period mentioned, of 4c. per lb.

About a month or so ago, China Congous were obtainable at 9½ to 10c., but lately the same class of tea has sold at 13½ to 15c., so that this class of tea also stands from 4 to 5c. higher than it was during the winter months.

Both Ceylons and Congous are difficult to obtain at the advanced prices.

Light supplies of Pingsueys have led to appreciation in their value also, for none are now obtainable under 12½ to 14c., the same goods selling during the winter at 9½ to 10c. These prices are, of course, for straight lots between traders, but they are having their influence in leading to a firmer attitude on the part of jobbers.

Recent cables from Japan state that new crop stock is commencing to arrive, and that the opening quotations show a decline of 10 per cent., but it is considered that, as the figures refer to first garden pickings, they afford no fair criterion for the latter descriptions of Japan tea, which are chiefly used in Canada.—*Canadian Grocer, 5th May.*

EUROPE AND BRITISH GROWN TEA.

AN INDIAN POINT OF VIEW.

The *Times of Ceylon* discusses under this heading the remarks of the *Madras Mail* on "The Tea Campaign" which we quoted in our last. The Colombo paper introduces a lengthy extract from the *Mail* bysaying:—

The *Madras Mail*, in reproducing most of our editorial of the 30th May, does not like Ceylon being in a position to discuss terms with her bigger sister; but a little chaff, which we reproduce below, does not alter the fact that this Colony has more funds at its disposal for the special exploiting of tea than the whole of India combined. The Calcutta papers will probably discuss the question in a more practical spirit, for we notice that our Madras contemporary, even when it grows sober, makes the astonishing proposal that South Indian planters should conduct a campaign of their own, *i.e.*, three separate Commissions for Europe to boom British-grown teas, with the expense of a separate one for only a sixth part of the tea output of India. Unless South Indian planters are prepared to tax themselves to the extent of at least double the Ceylon tea cess they would find their funds quite inadequate. The *Madras Mail* says that what is lacking is a leader; but when one is found—and this need not occasion great difficulty in selection—we are convinced that he will point out the utter futility of such separate action. The Tea Associations of India will understand the justice of our remarks, based upon Ceylon providing most of the money spent in North America hitherto; and, as we have already our Commissioner for Europe, the fact that a basis of co-operation more favourable to Ceylon than the old one will have to be arranged for that continent must be patent to all in India who are acquainted with the details. The Madras paper would prefer India not to work with Ceylon, and favours an antagonistic attitude that hitherto has not been taken up officially on either side; but as South India is to also separate from North India, we must await something practical from the North before such a subject need be further discussed After its introductory paragraph, containing several quotations from our article, the *Madras Mail* expresses itself as follows, carefully avoiding the subject of who has met most of the cost of the American "picnic", of the past five years and taking it for granted that leaving Russia out of the combination means attempting to exclude India from Russia altogether!

The *Times of Ceylon* adds:—

Referring to a portion of the above quotation, if there is political feeling in Russia against India, that would be an additional reason why Ceylon should keep its name separated from India in Russia.

The following is our local contemporary's reply:—

THE TEA CAMPAIGN.

The *Times of Ceylon* is not pleased with our recent remarks this subject, and even accuses us of not liking Ceylon being in position to discuss terms with her bigger sister, and of "careful avoiding the subject of who has met most of the cost of t American 'picnic' of the past five years." In pleading, "n guilty" we must urge that there is no evidence to support the acc sations, which are quite unfounded. What appears to hurt o contemporary is that we should advocate independent action on t part of India. in place of co-operation with Ceylon, and particular that we should urge South India to act for herself. Now, if Ceyl has had less advantage than India out of co-operation up to t present time, why should she wish to continue a system that is n favourable to herself; if more, then why should India take t bait that is put before her? As for the "futility" of South Ind acting independently, we can only say that, in our opinion, scheme might easily be drawn up that would be within Sou India's means, and that would give a better return in proportio to the money laid out than the past efforts of either the Planter Association of Ceylon or the Indian Tea Association have don This is a bold assertion, perhaps, but, at least, the above effor have done little for this part of India. The idea that Ceylon an Indian teas can be grouped together, and offered as if they consti tuted but one series of qualities, appears to us to be fallacio There is as wide variety between some Ceylons and other India as between any Ceylon or Indian and any China teas. South India teas are, generally speaking, totally distinct from Assams or Da jeelings, at any rate from the higher grades. Such South India teas as have been offered in the London market lately have be described as "useful sorts." That is what is wanted all the wor over, and if South India makes it known in other markets tha London that she has *useful sorts* to offer, she will reap the bene of increased competition among buyers. Whatever our Colom contemporary may say, we see no reason why India should ma terms with Ceylon in respect to tea campaigns in America or el where; and we specially deprecate the idea of South India placi herself in the position of the little streetboy, who steals a free ri at the back of a passing cab. She should push her own wares, n hang on to Ceylon or India's coat-tails.

As for the *Times of Ceylon's* remark about "political feeling Russia against India," our contemporary has so completely m understood our reference to political considerations as to try to p the boot on the wrong foot! If our contemporary will but consid that there is no Consular representative of Russia in India, and he will try to ascertain or to guess the reason, he may possi comprehend our statement that "political reasons obstruct progre in regard to a direct line of steamers from Calcutta to Odessa. rivalry with that which carries cargo from Colombo to Odessa.

COMPANIES AND COFFEE CONSUMPTION.

A sidelight was thrown from the Budget speech of the Chanc lor of the Exchequer on the prosperity of places of light refres ment which supply coffee, from the Aerated Bread Company a Lyons downwards "Coffee," said the Chancellor of the Exchequ "for once shows an increase, which may be due to the fact th there are a large and increasing number of excellent temperan refreshment rooms in London, where this excellent temperan beverage is in favour" We have had the curiosity to inquir little into the sudden increase in coffee consumption, and th results of the inquiry are remarkable. Take Spiers and Pon railway refreshment rooms, for example. We learn that at Wat loo alone 220,000 cups of coffee were consumed in the year end March, 1899, against only 48,000 cups in 1898, while at some of country stations the consumption of coffee increased sixfold Th 1,200 barmaids of the Spiers and Pond railway refreshment roo served 134 tons of coffee in 1899, representing 300,160 lbs. a 6,034,000 cups; in 1898 the figures were forty-eight tons, 107,520 and 2,678,000 cups, this being an increase of 3,356,000 cups in t year This may represent a change in public taste, but we sh imagine that it must be mainly attributed to the improvement the cup of coffee supplied under the new refreshment room mana ment of the company.—*Westminster Gazette.*

INDIAN TEA ASSOCIATION.

The following extract from Proceedings of the Eighteenth Annual General Meeting of Members of the Association, held at the Bengal Chamber of Commerce, on Monday, the 29th May 1899, will interest our readers :—

The Acting Secretary having read the notice convening the meeting, the Vice-Chairman, Mr. H. S. Ashton, in presenting the annual report said :—Gentlemen, In the absence of Mr. Anderson, who, happily for himself, is at the present moment in a much better climate than we are, it falls to me to present the report to the meeting, and I regret to say I never felt more indisposed to address a meeting than I do to-day ; not only because it is most disagreeably hot, but because I have had a very bad attack of fever. I propose to draw your attention to a few of the matters which have come before the Association during the year, and which have a direct influence upon cost of production and the cost of putting our teas into the hands of consumers. There are, of course, a large number of things which do not come exactly under that category to which it would take a great deal too long to refer. I do not for example propose to say anything about labour, or communications in Assam, or matters of that description. I think the most important matters, or perhaps the matters which we have the best chance of doing something in connexion with before very long, and which come under this category, and which affect the whole industry, are the English import duty and the dock and warehouse charges in London. These two matters in some ways are connected, because I do not think until we get rid of the duty we shall have any chance whatever of making head against what is a virtual monopoly in the hands of the dock and bonded warehouse companies in London. I wish particularly to draw this point to the attention of those who are not very keen on pressing the question of the abolition of the English import duty. This committee has recently addressed the Ceylon Association on this very subject. The Ceylon Association in their last report adopted a resolution to the effect that they did not consider it desirable to press the point. We asked the Ceylon Association their reasons for thinking an agitation undesirable. We have, however, not as yet got a reply to that question, and I do not know what their reasons are for taking up this position. But it so happens that a friend of mine in London has recently explained to me what the chief objections are on the part of those whom I may call the non-abolitionists. This gentleman, who is interested in the tea trade, has explained that the following is the argument upon which they base their contention. They say Chinese teas cost in bond, say, 5d., while Indian tea costs in bond, say, 8d. They assume, for the purpose of their argument, that two pounds of Indian go as far as three pounds of Chinese tea. Consequently they say that for the same number of cups of tea without duty you would pay 15d. in the case of Chinese, against 16d. in the case of Indian. The duty in either case is 4d., making Chinese tea 9d. and Indian tea 12d ex-bond. For three pounds of Chinese tea, therefore, with duty you would pay 27d., and for the corresponding two pounds of Indian tea 24d. The non-abolitionists, therefore, argue that with the duty India beats China on price, but if you take the duty off China beats India. That is their chief objection to the abolition of the duty. Now it seems to me that this is obviously an absurd argument, because if it were correct in principle it is quite plain that the higher the duty the better we should be protected. And they leave out of account entirely the fact that the cheaper you make tea the more you foster consumption. I have no doubt myself that, if we got rid of this duty, which amounts to 50 per cent. in the case of Indian tea at its present level, we should not only get people who do not buy tea at all now to come into the market, but we should increase the consumption the whole way up the social ladder. As my friend himself puts it, "even the ladies at the top of the ladder might be induced not to water the same charge of tea twice." Having regard to the fact that abolition means a reduction of 50 per cent. on present cost of tea *ex* warehouse, and that it would put us in a very much better position to deal with the bonded warehouse companies, I think there can be no doubt that abolition is a thing to go for. I am quite sure that the increased consumption—even if some of it did go to China—would benefit us enormously. I would urge, therefore, constant attention to this matter, and I hope that both our Ceylon friends who are lukewarm, and our London Committee, who are divided in opinion, on the question, will take up a firmer attitude, and be ready for a change of sentiment on the part of even the present Government, by which tea may be given a fair chance.

The next matter I have in mind is the one of ocean freights. Here again we knock up against what may be called a monopoly. Various points in connection therewith were brought to our attention very ably by our friend Mr. Tocher, and acting on his recommendations we brought the matter to the attention of the London Committee. The London Committee had also taken up the matter, and they are still in communication with the Calcutta Steam Conference upon it. I do not know what our chances are of satisfaction, and meantime it has been suggested to me—suggested by our most bellicose member, Mr. Carter—that we should go for the Steam Conference and try to get a very big subscription out of them for the foreign market fund. This fund, as you are all aware, is not this year to be ear-marked for use in the United States. Although the London Committee have terminated Mr. Blechynden's engagement, that does not mean that we are going to abandon America, where, up to date, we have done so well, and it is only a question of modifying the programme. With reference to enquiries we have made from the London Committee as to how they are going to spend the funds they have asked us to collect this year, they telegraphed on Friday as follows: —

"Levy will work America with Ceylon subsidise firms America, Russia, elsewhere. Balance Paris Exhibition."

The levy will, therefore, be used for America and for Russia, and the balance for the Paris Exhibition. I think I ought to point out to you—especially in view of the criticisms which have been made in the newspapers, and I think also by some of our own members since they heard of the termination of Mr. Blechynden's engagement—that the London Committee, who are our executive in all matters connected with Europe and America, are not in the happy position of our Ceylon friends. They do not know from year to year that they will get all the money they will require. They have to send out a levy, and they never know whether members of the association even will respond fully to their request for funds. Obviously this is very cramping when they have to make up a programme; and I think the details they have sent us are all we can expect at this stage of affairs I desire, therefore, to appeal most strongly to proprietors, if they accept the principle of joint advertising, to trust to the London executive, and not to cavil at details. The details of a programme can never satisfy everybody, and I confess to being a little suspicious of people who tell you that they approve of a general idea, that they are the last people in the world who seek to benefit by other people's expenditure, but that they have not subscribed because so and so is done, or has not been done. I suggest to you to subscribe first. Then, if you must swear from conscientious motives do so before you stop subscribing. Good may then result, and your suggestions be given effect to; but it appears to me that to stop subscribing first, and then to swear is not only most illogical but stupid. Gentlemen, I have seen from time to time criticism upon the action of the association in spending money upon foreign markets when they have, as it is said, a vast untapped market in India itself. Sir Alexander Mackenzie is among the latest critics, and in his evidence before the Currency Committee, the one instance he gave of the want of push he declared the tea trade guilty of, was that we had never touched the trade in India. He said in reply to question 10,534:—"There is the trade in India itself that has never been touched I may say for instance if they took a leaf out of the book of the Government of Bengal they could do something," and then he described how pice packets of quinine were distributed through the bazaars of India whereby an "enormous" trade was done. He omitted to state that the agency of distribution is the Government Post Office, but he went on to explain that "these small packets are packed by the inmates of the gaols, it is an industry for the juvenile and female prisoners."

I looked up the figures of the trade and I found that they received last year about Rs. 30,000 from the sale of the pice packets—nearly two millions of packets being sold. Well it so happens that we did try to take a leaf out of the Government book, and about a month before Sir Alexander Mackenzie gave his valuable evidence before the Currency Committee we wrote to the Director-General of the Post Office. We explained that the attention of the general committee had been drawn to the trade which might be done in Indian tea if there were adequate machinery for offering it at a cheap rate, and in small quantities to the masses of the population. Then we

asked whether Government would be disposed to sanction arrangements for Indian tea being sold by Postmasters throughout the country in small packets or tins in the same way as quinine and cinchona febrifuge are sold. It is needless to say that we met with a blank refusal. Had we known that the agency of "gaol industry" had been used as well as the Post Office, I think we should have asked for that assistance too. I think it is a pity that Sir Alexander Mackenzie, instead of reserving this information for the benefit of the Currency Committee—it had mighty little to do with currency—did not give us the tip when he was Lieutenant-Governor. Possibly it will still be worth while for the new committee to go to the Government fortified by Sir Alexander Mackenzie's opinion. With or without the aid of machinery of this sort it is, in my opinion, very difficult to increase the trade in India. I have often noticed in the criticisms people make on this matter, and the parallels they draw between what is done in India and in foreign markets, they leave out of sight the fact that in foreign markets we compete against beer, coffee, spirits, wine and so on. These are all very much more expensive articles than tea, and the difficulty in those markets is not one of price, but one of taste. We have to divert or create the taste of the people. In India it is quite different, because here the natives are almost entirely water drinkers, and tea, although it is cheap, cannot compete with water in price. The consequence is that whereas the important matter in foreign markets is taste, the important matter in India is price. It seems to me that to induce people—and a very slow moving people too—to spend more money on drink than they like is harder if you take profits into account than to divert taste, say from coffee to tea, when you at the same time save people's pockets. So personally I am not very much surprised that we have not been able to develop the trade quicker here. At the same time when Sir Alexander Mackenzie makes the statement that we have not touched the trade he is wrong, because we have touched it, and to a greater extent than appears in our own figures at present. This is a point which is having the attention of the committee, and we have been trying to get figures to revise the estimates so far as they bear upon local consumption. Though I put these points to you in opposition to what is the generally accepted view about the trade in India, I do not mean by that to advocate not pushing the trade. I think we ought to go on and try to improve matters. But the real question is one of educating the people to pay more for what is practically a luxury. It does not even yet pay us to sell tea at the price of water.

I suppose it would hardly be considered in accordance with the fitness of things if I did not refer to the currency question, but I confess I feel it difficult to know what to say, putting things briefly. The Secretary of State at the time of appointing the Currency Committee said the question of re-opening the mints did not come within the scope of their inquiry, and expressed the opinion that the supporters of such a policy were lunatics. Well the Tea Association ranged itself among those lunatics, and the agitation which followed brought home no doubt to the Secretary of State the fact that there were a good many more lunatics than there were asylums to put them in. For this reason, perhaps, or some other which has not been explained evidence on the question was taken, and we cannot complain that our views in this respect, and in connection with the Government policy generally, have not been heard. Our witnesses have contributed to the conflicting mass of evidence which in bulk seems to me to prove so little, but the folly of departing from free silver money and a sound metallic standard without any definite notion of what you are going to establish as a substitute. The committee appointed to find the best way out of the muddle has not yet announced its decision, but there can be little doubt as to their bias. It tends toward gold. Producers are meantime paying extra taxation to attain the end the Government have in view, and I do not see that we can do anything more now to prevent the burden being kept on our shoulders. We can only hope that this novel policy of making ends meet, which began by increasing the cost of administration, and as an afterthought turned to questions of expenditure through a commission that has existed for four years and has not reported yet, may ultimately result in something worth having. Till then India has a finance minister who, in his capacity of tax-gatherer, may be likened to the old man of the sea, who sat on Sinbad's shoulders and tightened his grasp whilst he plucked apples from the trees and eat them. Let us hope that, like Sinbad, India will be strong enough to stand the strain. (Applause.)

Mr. G. A. Ormiston said in the course of his remarks that there appeared to be a general impression that over-production is the main cause of recent depression, but if we had continued on t same currency basis as China, we would have been quite able have faced any fall in prices on fair terms. He also remarke —"It is very pleasing to notice the improvement in consump tion in America, but it is a pity that we should not have great scope for our production; although there may be opinions whic are at variance in regard to spending more money in Americ it might, and I hope in the end will be, to the advantag of the industry in seeking for other markets as America ma almost now be left to private enterprise. I think I am right i saying that if ten million pounds more of Indians had found othe markets than London we should not have seen the great slump i prices last season, and to this end we should not relax our effort in seeking for new markets. I trust, therefore, that all with n exception will come forward and contribute to the fund as hereto fore, as we have still much to do in securing new markets for ou produce. (Applause.) Russia seems a large field, and I notice the other day was put down as a consumer of 140 millions p annum, one-third of which was brick, and the Paris Exhibitio should do much good in bringing our tea more prominently befor all nationalities. We must not also forget India, to which th chairman has made reference.

Sir Patrick Playfair, *Kt.*, C.I.E., said, *inter alia*, I was particularly pleased to listen to the chairman's remarks upon th benefit it would be to the Indian Tea Industry, were the Britis duty abolished. In addition to the arguments that he has com bated, I may mention that an authority in the tea trade at hom lately represented to me as an argument in favour of the dut that it implies capitalists in the retail trade. We will all adm that the great capitalists and distributors, such as Lipton an others, have done a very great deal for the industry, but it ma not be altogether to our interest to check the number of tea me chants and distributors, and I do not think this argument hol good. The present may not be the most auspicious time to seek f the removal of the duty, as the British Exchequer has had lar demands made upon it of late in connection with Naval and Mi tary armaments But there is no reason why we should not colle our forces and be prepared to make a representation to H Majesty's Ministers when the proper time arrives.

The Vice-Chairman then moved the first resolution, *viz.*:—

"That the proceedings of the General Committee during the pa year be confirmed, the Report adopted, and the Accounts as audit be passed as correct."

This resolution was seconded by Mr. A. K. Muir, and on bein put to the meeting was carried unanimously.

The Vice-Chairman in moving the second resolution relating the engagement of a scientific officer said: Gentlemen,—T second resolution on the paper is one which the Committee decid to put before the General Meeting at a late stage, and as a matt of fact the resolution itself has not even been before the committ We only got a reply from the Assam Administration within th last few days. The reply is favorable to this extent: Mr. Cotto states that he now sees his way to give us a grant of Rs.2,5 a year for three years. This sum, together with Rs.5,000 a ye promised by the Government of Bengal, and the Rs.200 a mon which we have every reason to suppose the Assam branch w subscribe, makes a very fair sum of money—at any rate for thr years. It occurred to the committee that if they could, with t approval of members generally, devote a considerable amou of the surplus funds of the association, which are drawn from t ordinary subscriptions, to the purpose of appointing a scienti officer, it would be a good thing. As I had to get this resol tion on to the paper for the meeting to-day, I made it wi in scope, and I shall be glad if any gentleman, who has anythi to say on the subject, will bear that in mind. It is not the inte tion of the Committee (I mean the retiring Committee, and expect the incoming Committee will be of the same opinion even they get this authority) to go on with this scheme unless they s their way very clearly. The only thing I would mention now connexion with it is that Dr. Watt said in his book—"The Pes and Blights of the Tea Plant" that no man could thoroughly into the questions which had been up before him in less than t years. I beg to move the resolution which is as follows:—

"That the General Committee be authorised to make use of t surplus funds of the Association to such extent as they may fit for the purpose of employing an expert to study scientifical and report upon the cultivation and manufacture of tea."

Mr. D. A. Campbell in seconding the resolution said : Mr. Chairman and Gentlemen,—I have much pleasure in seconding this resolution. I do not think it is one which requires very much to be said in support of it, inasmuch as it is not really a new departure at all. You will all remember that not very long ago the Association employed Mr. Kelway Bamber in this capacity, and his services were unfortunately dispensed with somewhat prematurely, largely owing to want of funds. So what we have now to consider is the appointment of a really good man, and in order to appoint him we must be prepared to pay him well. There is nobody specially in view at present to fill the appointment so far as I know, therefore it is entirely a question of funds. The Chairman has reminded us that the appeals which have been made during the last few years on behalf of the American Market Fund have not been so well responded to as we might have wished. Upwards of 30 per cent of the industry still stand out. Our friends in Ceylon, as you know, were very quick to pick up Mr. Bamber's services, and I believe he is doing good work in the Island. In Java they are following on the same lines, and with regard to Indigo, our friends in Behar are also waking up to the necessity of utilising the services of science to at this critical stage of the existence of that industry. so we are decidedly behind the times with reference to this matter if we remain longer with our hands folded. I have therefore much pleasure in seconding the resolution the Vice-Chairman has proposed.

Sir Patrick Playfair said:—Gentlemen,—In connexion with this resolution it will be useful and necessary to understand whether the intention is to engage a Biologist, Entomologist, and Mycologist or a Chemist. It is improbable that, like Mrs Malaprop's definition of Cerberus, we shall find the three gentlemen rolled into one, carrying the highest expert authority. I understand that the subjects for enquiry are distinct in character and imply the study of a lifetime. Mr. Kelway Bamber, as a chemist, has provided in his investigations most valuable information. Dr. Geo. Watt, Director of the Economic Museum, has advanced our knowledge of the diseases of the tea plant by his most painstaking and scientific investigations of the insect and other blights with which it is attacked. It seems to me that it is now an important question to determine on what line further enquiry should be pursued. We should beware of the accusation that "they wanted an arithmetician and so chose a dancing master." I would suggest that the committee of this association should take the advice of the Director of the Economic Museum upon this very important question, and I do so, having myself been favoured with a very interesting and instructive communication from Dr. Geo. Watt in reply to enquiries made of him. His letter, which is dated 17th instant, I have the pleasure to place at the disposal of the committee of the tea association.

The Vice-Chairman.—The committee of course are quite aware that the expense is the difficulty about this matter. but the scheme will not be taken up before it has been thoroughly threshed out. The object of the resolution is, of course, to enable the committee to make use of the surplus funds for this special purpose. The committee did not think it right to utilise these funds without obtaining the authority of members for so doing.

The resolution was then put to the meeting and was declared carried.

Mr. N. McLeod then moved, and Mr. M. R. Quin seconded the third resolution, *viz.*:—

"That the rate of subscription for the current year from each garden belonging to the association be fixed at one anna per acre under tea cultivation."

This resolution. on being put to the meeting, was declared carried unanimously.

The Vice-Chairman then reported the result of the election for the general committee of the association for the year 1899-1900, held under rule 5 of the rules of the Association, as follows:—

Messrs. Balmer, Lawrie & Co.
" Begg, Dunlop & Co.
" Duncan Brothers & Co
" Finlay, Muir & Co.
" Jardine, Skinner & Co.
" Kilburn & Co.
" Octavius Steel & Co.
" Shaw, Wallace & Co.
" Williamson, Magor & Co.

With a vote of thanks to the Chair, the meeting separated.

MONTHLY MEETING.

The following are extracts from proceedings of a meeting of the General Committee of the Indian Tea Association, held on 5th June 1899 :—

On the motion of Mr. Begg, Mr. Ashton was unanimously elected Chairman of the Association for the year 1899-1900. Mr. Ashton, having taken the Chair, proposed that Mr. Begg be elected Vice-Chairman for the year. This was seconded by Mr. Tocher, and was carried unanimously. The Committee held on 1st May, having been approved in circulation, were confirmed. Proceedings of the Assam Branch for the month of April were laid on the table.

1 LB. DRAFT ALLOWANCE ON TEA SALES.

Mr Tye had forwarded copies of a joint circular issued in London by the Indian Tea Association and the Ceylon Association asking support to a proposal to abolish the 1 lb. draft allowance on teas sold at public auction in London. This circular had been reprinted in Calcutta and issued to all members of the Association. The proposal was strongly supported by the General Committee, and a number of favourable replies had been received. These were to be forwarded to London in due course. It was understood that support had been received in London to the extent of 83,880,500 lbs. of Indian, and 29,702,000 lbs. of Ceylon, tea up to the time of writing.

INDIAN COFFEE AT THE PARIS EXHIBITION.

Considered (1) letter of 21st May from the Honorary Secretary, Nilgiri Planters' Association, asking whether a coffee room could be run in connection with the proposed Indian tea room at the Paris Exhibition, and the probable expense of so doing; (2) letter of 26th May from the Secretary, United Planters' Association of Southern India, stating that that body had been informed by the Madras Government that the Government of India was prepared to allot space to the Indian Tea Association and to the United Planters' Association for an adequate exhibition of tea and coffee at the Paris Exhibition. The Government of India also suggested that should the two Associations desire to avail themselves of the offer the arrangements might be most conveniently carried out by a Central Committee working in London. The Planters' Association wished to act, as far as possible, in concert with the Indian Tea Association, and it was asked in the letter if any definite plan of action had been formulated. They were also desirous that a coffee room should be opened in co-operation with the tea room. After some discussion it was decided to forward copies of both the letters quoted to the Committee of the Association in London for their information in connection with the arrangements being made. It was also decided to write to the United Planters' Association to the effect that the General Committee were not yet in a position to state definitely what arrangements would finally be made for the representation of Indian tea, or whether the Committee in London could work in conjunction with the representatives of the coffee industry if the latter desired to exhibit. It was also to be suggested to the United Planters' Association that they should put themselves in communication with the Indian Tea Association, London, stating the amount of money they were prepared to spend in connection with the Exhibition and the space desired for both tea and coffee. The Nilgiri Planters' Association were to be informed in reply to their letter that the matter had been brought to the notice of the General Committee by the United Planters' Association, to which body they were to be referred.

AMERICAN MARKET FUND.

Letters of 14th, 21st and 28th April from Mr. Ernest Tye, Secretary, Indian Tea Association, London, dealing with the American Market Fund, came up for consideration and disposal after previous circulation. With these letters were forwarded copies of the *New York Herald* containing extracts from the European edition of that paper comparing Indian and Ceylon teas with those of China, and asserting the inferiority of the former. The extracts consisted chiefly of a lecture delivered by Dr. John Goodfellow in 1896, in which Indian tea was held to be inferior to China tea. Copies of subsequent issues of the *New York Herald* had also been received containing letters controverting the statements made in the lecture. Copies of the various papers had been published in the Calcutta newspapers. It was also stated in the letters from Mr. Tye that the Committee of the Association in London had arranged with Mr. Mackenzie to continue the joint advertising of Indian and Ceylon teas in the United States to the end of the year, although the arrangement was subject to the sanction of the Ceylon Com-

mittee. It did not appear to the General Committee to be necessary to take any action with respect to the matters referred to in these letters.

MONTHLY TEA TELEGRAMS FOR THE LONDON PRESS.

Considered letter of 19th May from Messrs. Williamson, Magor & Co. suggesting that an endeavour should be made to obtain greater publicity for the monthly telegrams sent to London during the tea season by the General Committee. Messrs. Williamson, Magor & Co. were of opinion that these telegrams, which give information as to whether in the tea districts, prospects of outturn, &c., might with advantage be published in the London newspapers. It would, they considered, be to the good of the industry generally if news items of interest from the producers' standpoint were communicated to the English public in the same way as information of interest in connection with tea in England is embodied in Reuter's commercial telegrams to India. The General Committee, after some discussion, agreed with the views expressed by Messrs. Williamson, Magor & Co. It was accordingly decided to draw the attention of the Committee of the Association in London to the matter with a view to the monthly telegrams referred to being published in the London newspapers An attempt was also to be made to give somewhat fuller information in the telegrams than has up to the present been customary. It was also agreed to draw the attention of the Branches of the Association; the affiliated Association and others by whom the telegrams are sent to the necessity for promptitude in giving the Committee information.

The further arrangements to be made in connection with the scheme in view of the resolution passed at the Annual General Meeting held on the 29th May were discussed, and it was decided to write to the Committee of the Association in London, and to the Local Associations interested, asking for suggestions as to the best means of carrying it out. The Associations were to be asked specially for their views upon the question of whether a Biologist or a Chemist should be engaged. The Committee had received, through the courtesy of Sir Patrick Playfair, *Kt.*, C.I.E., a letter dated 19th May from Dr. Geo. Watt, Reporter on Economic Products to the Government of India, upon this aspect of the question. This letter was ordered to be circulated to members of the Committee for further consideration. The Committee recognised that it would be necessary to obtain an expression of the opinion of the Planters interested, through their Associations before proceeding to take any steps for the engagement of an officer.

THE TEA TRADE OF INDIA, 1898-99.

The following extracts from the Report on the Seaborne Trade of Bengal for 1898-99 may prove of interest to our readers:—

The exports of Indian tea have been steadily rising every year for the past decade at least, and during 1898-99 were over four million pounds, or 2 8 per cent. above those of the previous year.

The following statement shows in detail the exports of Indian tea to each of the countries to which shipments are principally made:—

	1897-98. lbs	1898-99. lbs		Difference. lbs.
United Kingdom	133,773 679	135,396,722	+	1,623,043
Australia and New Zealand ...	6,776,795	6,292,995	−	483,800
United States ...	929.600	1,411,724	+	482,124
Germany	438,731	518,133	+	79,402
Russia	30,581	49,700	+	19,127
China	565,274	883,295	+	318.021
Canada	593,532	1,044,256	+	450,724
Aden	57,862	108,929	+	51,067
Arabia	101,179	220,724	+	119,545
Persia	112,881	456,613	+	343.732
Straits Settlements ...	37,324	34,287	−	3,037
Turkey in Asia ...	1,137,463	2,169,667	+	1,032,204
Egypt	123,008	124,663	+	1,655
Cape Colony ...	123,232	26,970	−	96,262
Turkey in Europe ...	314,481	536,594	+	222,113
Other countries ...	40,026	82,169	+	42,143
Total ...	145,155,648	149,357,449	+	4,201,801

It will be observed that all countries show an increase except Australia, Cape Colony, and the Straits The decline to these amounted to 7·1, 78·7, and 8·1 per cent., respectively. The exports to Australia were affected by largely-increased supplies bei taken by that Colony from Ceylon.

The principal countries showing an increase are mentioned belo with the percentage of increase in each case:—

United Kingdom	1·2 per cent.
United States	51·8 „
Canada	75·9 „
Turkey in Asia	90·7 „
Persia	304·7 „
China	56 2 „

The large improvement in the trade with Canada and the Unite States is satisfactory, and the increase to China is also noticeab

The actual yield of the Indian tea crop of 1898 was as follows:—

	lbs.
Assam	62,172,660
Cachar	20,363,496
Sylhet	24,155,196
Darjeeling	7,654.467
Terai	3,424,385
Dooars	25,717,446
Chittagong	887,263
Chota Nagpur	155,020
Kangra	2,070,000
Dehra Dun and Kumaon (estimate)	2,000,000
Private and native gardens (estimate)	4,000,000
Total...	152,900,233

The preliminary estimate was for a crop of 158,681,312 lbs. an the revised one reduced this to 154,167,817 lbs., but the actual resu turned out to be 1,267,644 lbs. below even this The production however, has been the largest on record, and is attributable to th steady extension of acreages and the maturing of seedlings. Th occurred in spite of drought in Cachar and Sylhet and insufficien rainfall in Darjeeling, which retarded flushes and reduced ou turns, and was likewise injurious to quality, particularly in th case of the two former districts. The majority of the teas of th past year have been of common grades, and this and the large pro duction have reduced the average sale-price per pound by fou pies as compared with the previous year. Consumers are willin to pay fair prices for good liquoring teas, but are tempted by lo rates to purchase the inferior grades and with a rapidly increa ing production low prices must necessarily result.

The average price per pound for the past ten years has been :—

1889-90.	1890-91.	1891-92.	1892-93.	1893-94.	Average of 5 years
As. p.	As. p	As. p.	As. p.	As. p.	As. p.
8 1	7 8	7 8	8 8	8 2	8 1
1894-95.	**1895-96.**	**1896-97.**	**1897-98.**	**1898-99.**	**Average of 5 years**
As. p.	As. p.	As. p.	As. p.	As. p.	As. p.
9 3	8 9	8 8	8 5	8 1	8 8

It will be observed that the price of the past year has been equ valent to the average of the five years preceding the great rise o 1894-95. The rise in exchange is not sufficient to account for th fall during the past as compared with the preceding year.

The extent to which Ceylon tea competes with Indian makes desirable to mention, as in previous years, the principal facts an statistics relating to the trade in that article also. The total e ports of tea from Ceylon during the past year amounted t 122,395,517 lbs., or 6·9 per cent. in excess of 1897-98. From th export figures of the past six years it will be noticed that the t trade of that island has been expanding steadily year by year:

1893.	1894.	1895.
lbs.	lbs.	lbs.
82,269,353	85,376,353	98,581,057
1896.	**1897.**	**1898.**
lbs.	lbs.	lbs
110,095,193	114,466,318	122,395,517

The principal shipments of tea from Ceylon during the past tw years have been to the following countries:—

	1897. lbs.	1898. lbs.		Difference lbs.
United Kingdom ...	97,500,012	99,256,127	+	1,756,115
Australia ...	12,925,876	15,137,846	+	2,211,973
Germany ...	272,046	390,134	+	118,088
Russia	347,140	2,431,577	+	2,084,437
Hongkong ...	478,211	698,946	+	220,735
New Zealand ...	156,179	128,574	−	27,605
United States ...	482,199	1,576,095	+	1,093,896
Canada	382,440	318,145	−	64,295
British India ...	1,189,481	1,266,253	+	76,772
China	122,931	252,636	+	129,7

In this connection it will be seen that the exports to Russia show the abnormal increase of 60·4 per cent. This increase is attributable to the vessels of the Russian Volunteer Fleet employed in the conveyance of convicts, railway materials, and munitions of war to Vladivostock and the Far East, having on their return voyage freighted themselves with tea from Ceylon for South Russian ports, whence it is conveyed by the Trans-Caspian Railway to Central Asia and Tartary. The palates of both the Russian and the Tartar have, however, yet to acquire the taste for the artificially-rolled and sirocco-withered teas of India and Ceylon, accustomed as they have been to the fermented leaves, hand-rolled and sun-dried, of Chinese manufacture, imported through Chinese Tartary. In connection with this subject it may be mentioned that there are now 500 acres of land north of Batoum under tea cultivation, and the manufacture has so far proved a success, but whether it can stand competition has yet to be proved.

The exports of Ceylon teas to the United States have also further increased by 226·8 per cent. and have fully justified the work of the Indian and Ceylon Commissioners, while the fact that direct steamers now leave Ceylon for New York, sailing under the American flag, is apparently having a beneficial effect on the trade of the island.

The trade in Ceylon tea with Australia has also expanded considerably, the increase in the exports in the past year having exceeded those of 1897-98 by 17·1 per cent. The increase has been much in excess of the decline in the exports of Indian tea to Australia, and the position of Colombo as a port of call on the route to that country gives the island an advantage over India.

The largest shipments of Ceylon teas have, however, been to the United Kingdom, and they have increased by 1·8 per cent. as compared with 1897-98.

The following figures represent the importations of tea from all producing countries into the United Kingdom and the deliveries during the years 1897 and 1898.

	1897. Imports.	Deliveries.
Indian	...134,886,000 lbs.	127,357,000 lbs.
Ceylon	... 93,447,000 „	95,173,000 „
China, &c. ...	... 32,400,000 „	38,602,000 „
	1898. Imports.	Deliveries.
Indian	...138,874 000 lbs.	139,089,000 lbs.
Ceylon	... 94,319,000 „	93,488,000 „
China, &c. ...	... 33,514,000 „	34,878,000 „

Imports increased in all cases, but principally from India. Deliveries of Indian tea also increased very largely, while those of Ceylon and China fell off.

The stocks in bond on the 31st December were—

In 1897	In 1898.
97,151,000 lbs.	96,403,000 lbs.

Stocks in bond were reduced below what they were in either of the two preceding years, but still remained higher than they had been since 1893.

The following figures show the consumption of Indian, Ceylon, and China teas in the United Kingdom since the year 1866, figures for Ceylon, however, not being available before 1890 :—

	Indian. lbs.	Ceylon. ...	China, &c. lbs.
1866 ...	4,584,000	...	97,681,000
1867 ...	6.360,000	...	104,628,000
1868 ...	7,746,000	...	99,339,000
1869 ...	10,716,000	...	101,080,000
1870 ...	13,6 0,000	...	104,051,000
1871 ...	13,956,000	...	109,445,000
1872 ...	16,656,000	...	111,005,000
1873 ...	20,216,000	...	111,665,000
1874 ...	18,528,000	..	118,751,000
1875 ...	23,220,000	.	122,107,000
1876 ...	25,740,000	...	123,364,000
1877 ...	27,852,000	...	132,263,000
1878 ...	36,744,000	...	120,652,000
1879 ...	34,093,000	...	126,340,000
1880 ...	43,836,000	...	114,485,000
1881 ...	48,336,000	...	111,715,000
1882 ...	50,496,000	...	114,462,000
1883 ...	59,000,000	...	111,780,000
1884 ...	64,217,000	...	110,843,000
1885 ...	65,678,000	...	113,514,000
1886 ...	68,420,000	...	104,226,000
1887 ...	83,112,000	...	90,528,000
1888 ...	86,210,000	...	80,653,000
1889 ...	96,000,000	...	61,109,000
1890 ...	101,961,686	34,416,469	57,530,337
1891 ...	98.941,631	51,227,602	52,287,304
1892 ...	109,528,169	63,102,127	34,483,408
1893 ...	108,143,602	64,218 062	35,735,722
1894 ...	116,965,653	71,570,078	25,805,313
1895 ...	116,343,316	74,023,809	31 433,014
1896 ...	122,941,098	80,294,475	24,549,936
1897 ...	124,534,194	85,493,552	21,372,030
1898 ...	133,430,351	82,471,745	19,512,009

The consumption of Indian tea in the United Kingdom has increased steadily year by year, with the exception of slight checks in 1874, 1879, 1891, 1893, and 1895. Ceylon teas have gone up without check and at a rapid rate until the past year, when they show a decline of three million pounds. The consumption of China teas went up with a check only in 1868, until 1877, after which there has been a steady decline with the exception of a check in 1879, 1882, and 1885. In the past year the decrease has amounted to 1,860,021 lbs., or 8·7 per cent., as compared with 1897, while Indian teas have gone up by no less than 8,896,157 lbs., or 7·1 per cent., and much more than counterbalanced not only the decrease from China, but that from Ceylon as well.

The shipments of Indian tea from Calcutta to other Indian ports showed a satisfactory increase from 2,192,872 lbs. in 1897-98 to 3,91×,618 lbs. in 1898-99, of which 1,899,601 lbs. and 3,629,644 lbs., respectively, went to Bombay. Shipments to Bombay had been restricted in the previous year on account of the plague, but the low prices of the year under review stimulated exports to Bombay, a large portion of the trade with which is intended for the Persian market and is confined to the low and cheap grades. At the same time, the direct trade of Calcutta with Persia also increased from 112,881 lbs. to 456,613 lbs.

COFFEE PLANTING IN SAN PAOLO.

The President of San Paolo, one of the States of Brazil, assumed office on the 10th November last, so that when he issued a "Message" on the 7th April, 1899, he was doubtless referring mainly to the administration of his predecessors. His own individuality is, however, so strongly marked in his words, and these are of such moment to the coffee industry, that we regard the Message as a very interesting document. It points out how for many years the tide of wealth and prosperity flowed in the City of San Paolo without interruption, raising the city from the rank of a small and uninteresting provincial town to that of a large and important capital. Government then was an easy task. Money flowed in and money flowed out. Roads and railways, new buildings, drainage, water-supply and sewage, new schools and higher education passed from the category of luxuries or dreams to that of necessities. The whole State appears to have received attention, especially in regard to drainage, and as a result the mortality returns show very considerable improvement. The cost of all this was heavy, however, and when the tide of financial prosperity was suddenly checked, while the pressure of population was, perhaps, at the highest level ever known, the Government naturally found itself embarrassed, and the State of San Paolo shared the many difficulties that have lately beset Brazilian finance in general.

The President asserts that the very energy and activity of the planters proved their own undoing. "The more they strove and laboured and planted coffee, the more it fell in price and proved their own damnation in years to come. Had they been content to leave their towns to the plague, and the rural population to be decimated year by year, had they sat down and refused to import more labour or to plant more coffee, it might have been better for them to-day—had they survived, or for their heirs had they too succumbed to the plague, as they probably would." Strong words do not necessarily mean forcible argument, but the above statement does not appear to be a mere rhetorical flourish. It is unquestionably a statement of facts, from one point of view. Paradoxical as the statement may seem, it is true that hard work and enterprise have brought the Brazilian coffee planter nigh unto ruin. So long as coffee kept up, says the Message, so long as the quantity increased year by year, the State might outrun the constable with impunity, for next year's surplus would surely compensate for any temporary deficit. Thus the Government went on

without seeking aid from outside, and doubtless too without sufficiently scrutinising its expenditure. Even at the best of times, it is now remarked, the strain put upon the State in time of plague must have proved beyond its resources, and when in 1895 the great fall of coffee prices commenced, "that seems not to have stopped even yet," revenue became absolutely inadequate to meet such extravagant calls. "As coffee fell in value and revenue diminished, one by one, works of the utmost importance to the health and well-being of the State were first of all suspended and then abandoned."

Owing its prosperity to coffee, owing also to coffee its embarrassments—for "ruin," though used by the President, appears too strong a term—what is San Paolo to do now? Evidently feeling that the word "ruin" is but an expression, the President himself urges the people to fight the battle out. He argues that the money spent has not been thrown away "To prevent" (disease) "is better than to cure," he says, and even if the process has proved somewhat costly and involved the State in temporary difficulties, it will be repaid a thousand-fold within very few years, if it is not so indeed already. He still looks to coffee as the controlling power, and in defiance of paradoxes he evidently expects salvation to be worked out by that very energy of coffee planters to which he attributes present disastrous conditions. In his opinion, the future of San Paolo is secure, whether coffee goes up or down. Not that the State is independent of coffee, or unaffected by fluctuations in its value; but rather because coffee is dependent on the State of San Paolo. The President's remarks on this point should be pondered by coffee planters in this country. "It is certain," he says, "that no other countries, nor even any other part of Brazil itself, can compete with San Paolo as regards cheap production of coffee. Should prices fall to such a level as to make cultivation impossible elsewhere, it will still be profitabe there. The more coffee is forced out of cultivation elsewhere by low prices, the sooner the inevitable reaction must come, and with it the revival of San Paolo's prosperity. "Placing faith in the doctrine of the survival of the fittest, and confident that San Paolo *is* the fittest for the coming struggle among coffee producers, the President expresses his confidence clearly, and throws down the gage to the world. The fittest in every way is San Paolo, he asserts. There, coffee will continue to be produced and profit to be made when everyone else has abandoned it as a losing business. "When, in this manner, the enormous production has been reduced to more moderate limits, San Paolo's opportunity will have arrived, when with a virtual monopoly of the coffee trade it will, with a proper organisation, be able to control prices and dictate conditions to the world."

There may be a good deal of bombast about this peroration, but the main points of the statement quoted are correct. The unfit will have a bad time while coffee prices are low, the fit will struggle through. Whether production will be lessened or not, remains to be seen, for unquestionably coffee can be produced at a profit even at present low figures. How India will stand the strain is the point of chief interest to us. She may continue to produce coffee of a very high class and thus maintain a separate level of prices for herself; or she may go in for cheap cultivation and competition with Brazil. Leguminous manuring has been recommended as economical; but before expressing an opinion on it we should like to know what class of coffee has resulted from cultivation of this kind, and what prices have been realised. So far we have heard of none but very low figures, and if leguminous manuring means deterioration of quality and direct competition with Brazilian coffee, we think it will hardly suit India. Following up the paradoxes uttered by the President of San Paolo, we may state that the great fall in prices does not appear to us to have been an unmixed evil to coffee planters. But for it consumption would probably have decreased, and tea and cocoa would have gained an advantage. The fact that coffee is "the national drink" in the United States may, we think, be mainly attributed to its cheapness; and we might almost say that Brazil's low prices have assisted Indian coffee by establishing a market for the article, and creating a taste, the education of which up to the standard of high quality Indian coffee should be the aim of the planter in this country. Thus, the reduction of cost to a minimum without lowering quality, and the reduction of all expenses of putting on the market are the ideals that the producer of Indian coffee should set before himself. If he can attain them, he will no doubt be able to face even the vigorous competition of San Paolo with a calm mind.—*Madras Mail.*

DISTRICT ASSOCIATIONS.

LOWER PULNEYS.

Proceedings of the Annual General Meeting held at the Dindig Club, on Saturday, 3rd June 1899. Present:—W. H. Gerrard, Es Chairman, H. Ludwig, Esq., E. Morgan, Esq., and F. B. Gerra Esq., Honorary Secretary.

Minutes of last Meeting taken as read.

Read notice calling Meeting.

Read letter from Mr. H. O. Newport, resigning his membership the Association.

The Chairman called on the Honorary Secretary to read the Annu Report.

REPORT.

Mr. Chairman and Gentlemen,—In presenting my Report f 1898-99, I regret I cannot record an altogether flourishing positio of affairs. Crops, which in the early part of 1898 we were so sanguin would be large, proved disappointing. The average rainfall on t Lower Pulneys and Siroomullay hills, during June, July, and to 20 August, 1898, did not exceed 55 cents, showing what a total failu the S.-W. monsoon was. This prolonged drought, accompanied wi a bad attack of Green-bug, resulted in serious damage to our crop For the present season, crops again will not be satisfactory, and price I regret to say, have fallen very low.

Roads and Communications—*Railways.*—From the occasional not of the *Madras Mail* of 16th May, I quote the following:—"T question of constructing a line of railway from Podanur to Dindig is again being discussed. The Agent and Manager of the Madr Railway, it is reported, has placed himself in communication wi his Board of Directors with a view to receiving definite instructio as to whether the proposed railway should be of the standard metre-gauge."

This is good news, though, I think, it would pay better, if the poi of junction were made at Palghât, instead of Podanur, as pointed o by us in the Memorial we presented to His Excellency Sir Arth Havelock in March 1898.

Roads—*The Ahtoor-Tandigudy Bridle-path.*—Little or nothing h been done. That fine trace (1 in 20) from the foot of the hills Tandigudy made by Lieutenant Close, R E., has been put aside for t reason, as I understand, of its being too expensive. The original es mate has to be revised. An Overseer of the P. W. D. has been f some months engaged in cutting short the trace made by Lieutena Close, with the object, of course, of reducing the original cost of t work. Let us hope, when the revised estimates are sent in to Go ernment, they will be sanctioned, and the work put in hand at once

Our thanks are due to the Local Fund Engineer for the good st of repair in which the Dindigul-Palakanuthu Road is kept. T bridle-path to the Siroomullays is also in fair order, though the sa cannot be said of the Punnaputhy-Ardalur path, which needs i mediate attention.

Ardalur Post Office.—This question was first brought up by o Association in 1895; and every year since the Postal authorities ha been addressed on the subject. The last communication I receiv was to the effect that, as no funds were available from the curre year's grant (1898-99), the proposal is postponed to the next year. have written again to the Postal Department reminding them of th promise.

Police.—Our request for the appointment of special constab during crop season, for the prevention of coffee-stealing, was, as y are all aware, acted on at once by the Superintendent of Police. Pa books were issued, and 14 * special constables were appointed, a stationed at all the principal out-lets to the plains from the Low Pulneys. All present will, no doubt, join me in saying that th steps conduced very materially to suppress coffee-stealing, which, previous years, was carried on with such impunity. Our warm thanks are due to Mr. Clement Smith for the able manner in wh this work was carried out, and for the good results achieved.

Lady-birds.—During the past year no action has been taken towa importing this useful insect (our only remedy for eradicating t

* Ayakudy, 2; Iyempolliam, 2; Sittyamkottai, 1: Ambaturai, 1: Kannivadi, Palakanuthu, 1; Virupatchi, 2; Buttagundu, 1; Puliyoor (Siroomullays), 2

awful pest—Green-bug). It has been suggested by the Nilgiri Association that Mr. Newport be asked to send periodical consignments of Lady-birds by post from Australia. Unless we have an Entomologist on this side to receive these insects, and subject them to a careful examination before setting them free, there would be the danger of introducing the parasite. We cannot be too careful, or the remedy may prove worse than the existing evil. As this question is to be discussed at this Meeting, I shall say nothing further on the subject.

U. P. A. S. I.—The book of Proceedings for 1898 is laid on the table. I have circulated to members all the circulars and letters received from the Secretary, U. P. A. S. I., during the year, so that you know all about the important subjects at present engaging the attention of the Central Association.

Mr. John Cameron's interesting report of his visit to Coorg, you have also read, and let us hope that this is but the first instalment of a series of useful reports to follow, and, when the investigations now being carried out by the Agricultural Chemist employed by the Mysore Government come to be published, they will, I feel sure, prove a valuable record of information to all of us.

Finance.—I am laying on the table copies of the balance sheet for the year.

I now place my resignation in your hands.

FRED. R. GERRARD,
Honorary Secretary,
The L. P. P. A., Dindigul.

The Chairman proposed the adoption of the Report.

The accounts having been examined were passed.

Seconded by Mr. E. Morgan—*carried.*

2. The report of the delegate to the U. P. A. S. I. Meeting was taken as read, and recorded.

3. **Alterations to Rules.**—The Chairman read out the rules, pointing out the alterations necessary. These were discussed by the meeting, and passed.

4. **Lady-birds.**—Mr. W. H. Gerrard said: "Mr. H. O. Newport was sent over to Australia to collect Lady-birds; the experiment, as you all know, was an utter, and to us disastrous, failure; for we are somewhat in the same position now, as so vividly described by Mr. Newport in a speech before the U. P. A. S. I. two years ago (1897). He then said: "Even if this bug spares our trees, it does not spare the crops, and, if something is not done—and that quickly,—we, on the Lower Pulneys, will have to abandon our estates, and leave the District." Of course the picture was overdrawn. No estates have had to be abandoned on account of the attacks of Green-bug; but there is little doubt that the continued attacks of this pest have had a good deal to do with the short crops of the last few years, and it is for this reason that we would welcome the arrival of Lady-birds to put an end to the bug: for it is very evident that, with present low prices, it is absolutely necessary for the trees to bear large crops, and any pest that prevents them from doing so, by destroying good bearing wood, becomes a very serious evil.

So much money has been spent over the Newport failure, that there is little left for further experiment, and how, now, to successfully introduce Lady-birds from Australia, will require very careful consideration at the next meeting of the U. P. A. S. I. I think you will all agree with me that a skilled Entomologist should receive the consignments as they arrive, for there is always the danger, I believe, in unskilled hands, of introducing with the insect, the parasite that feeds on it; and, with reference to this matter, I don't think that a Botanist can be expected to carry out the work of an Entomologist.

After further discussion, it was proposed by Mr. W. H. Gerrard, seconded by Mr. E. Morgan, and carried—

"That, as we do not intend sending a delegate to the U. P. A. S. I. Meeting this year, the Honorary Secretary write a letter to the Secretary, U. P. A. S. I., embodying our views on the subject of Lady-birds, and their introduction into Southern India, and requesting him to place the letter for consideration before the next meeting of the U. P. A. S. I.

5. **East India Coffee.**—The Chairman made the following remarks:—"We have heard a good deal lately of the low prices received for East India coffee. I think this is due, as far as the Lower Pulneys are concerned, partly to the long drought we had from May to 20th August 1898, and partly, of course, to large supplies from Brazil, which caused a glut in the market, rather than to bad pulping, and curing, and I agree with a correspondent signing himself "Wynaad," in the *Madras Mail* of 26th May, that "when the present glut in the market is over, and East Indian trees are not over-cropping, we shall hear no more of drying coffee by artificial heat," and he might have added—wooden pulpers."

The meeting agreed to these remarks and desired that they be recorded.

6. **"Planting Opinion."**—*Read* letter from the Proprietor, dated 3rd October 1898, and Honorary Secretary's reply, dated 10th November, 1898.

Resolved that the Lower Pulneys Planters' Association subscribe to the *Planting Opinion* from 1st June, 1899.

7. **Subscription to the U. P. A. S. I., for 1899-1900.**—Resolved that our Association pay the same subscription as last year.

8. **U. P. A. S. I. Annual Meeting, 1899.**—Our Association will not be represented at the U. P. A. S. I. Meeting.

9. **Stamp-fees on Crop Hypothecation.**—*Read* letter from Secretary, U. P. A. S. I., No. 63, dated 30th May, 1899.

Resolved that the Honorary Secretary write to the Secretary, U. P. A. S. I., to say that we agree with the remarks made by Messrs. Arbuthnot & Co., that immediate action should be taken to get this duly altered.

10. **Petty Coffee Theft Cases.**—*Read* letter from the Honorary Secretary to the Joint Magistrate, Madura District, dated 25th January, 1899, and the reply from the Joint Magistrate, dated 30th May, 1899.

After discussion, it was resolved that this matter be postponed.

With a vote of thanks to the Chairman and Honorary Secretary for the work of the past year, and a request that they continue in office for the current year, the Meeting closed.

W. H. GERRARD,
Chairman.

FRED. R. GERRARD,
Honorary Secretary,
Lower Pulneys Planters' Association.

MARKET REPORT.

By Mail advices of 26th May, 1899.

COFFEE.

The *London Commercial Record* says:—The public market reopened yesterday after the Whitsun recess, the supplies at auction chiefly consisting of Costa Rica and Central American descriptions, and formed part of the sales postponed before the holidays. The demand was very irregular, colory qualities as usual commanding attention at firm prices, whilst the less attractive grades were only partly sold at rather lower rates. A small parcel of Ceylon realised fully valuations. Mysore dull of sale, only about one-third being disposed of; prices, however, showed no alteration. A flat tone has prevailed for "futures," and closing prices are rather in favor of buyers, viz.:—

London	... Santos	... July delivery	... 28s. 6d.
New York	... No. 7 Rio	... „ „	... 5.10 cents.
Hamburg	... Santos	... „ „	... 29¼ pf.
Havre	... Santos	... „ „	... 35 francs.
Holland	... Good ordinary Java	..	... 27¾ cents.

Imports, Deliveries and Stock of Coffee in London are as follows:—

		Stock.		Imports.	
		1899.	1898.	1899.	1898.
West India ..	tons	982	700	1,153	1,397

Total tons ...		6,787	6,143	9,193	10,084

The preceding figures exhibit—

In the Imports an increase this year of 1,799 tons.
Home Consumption an increase of 644 „
Export a decrease of ... .. 891 „
Stock an increase of ... ... 6,839 „

Auctions yesterday passed off as under:—

Ceylon.—*Plantation.*—5 casks 1 tierce 8 barrels 1 bag sold, smalls 45s, low middling 80s to 92s, bold brownish 96s to 99s, pea-berry 54s to 60s.

East India.—361 bags partly sold as follows: *Mysore*, smalls 49s 6d, pea-berry 105s. *Neilgherry*, smalls 41s.

Jamaica.—Of 11 barrels 20 bags offered only one lot sold at 32s

Nyassaland.—Of 289 bags offered 50 bags sold, smalls 32s 6d, good ordinary 40s, good middling dull colory 63s, pea-berry 45s.

Costa Rica.—2,295 bags mostly sold, ordinary to fine ordinary 35s to 40s, fine fine ordinary brownish 45s, middling dull to bright blue 60s 6d to 67s 6d, good to fine middling 69s 6d to 82s 6d, good to fine bold 83s to 103s, pea-berry 39s 6d to 81s 6d.

Guatemala.—Of 434 bags catalogued about 300 bags sold, low middling to middling at 47s to 48s 6d.

Salvador.—642 bags about half sold, good to fine ordinary foxy greenish 34s to 40s 6d, fine ordinary dull grayish 40s, middling dull colory 50s, pea-berry 56s 6d.

Nicaragua.—77 bags mostly sold, low middling to good middling greenish colory 45s 6d to 58s, pea-berry 61s.

Colombian.—513 bags offered and about 300 bags sold, good ordinary to low middling greenish 40s to 44s, middling to good middling colory 52s 6d to 60s 6d, bold dull colory 66s, pea-berry 55s to 61s.

Mexican.—859 bags practically all sold, smalls 30s 6d to 33s, fine fine ordinary 47s, low middling 49s to 50s, good middling greenish 53s 6d, good middling grayish 55s 6d to 56s, bold 70s to 73s, pea-berry 61s to 73s 6d.

Auctions to-day offered 466 bags East India, 109 bags Haiti, 10 half-frazils Mocha, 5 casks 126 barrels 63 bags Jamaica, 117 bags Costa Rica, 2,192 bags Guatemala, 345 bags Salvador, 236 bags Columbian, and 31 bags Nicaragua. The sales went of at irregular prices—demand very slow.

Receipts in Rio and Santos.

Since July 1	1898-9. Bags.	1897-8. Bags.	1896-7. Bags.	1895-6. Bags
Rio	2,908,000	4,064,000	3,312,000	2,192.000
Santos ...	5,202,000	5,958.000	4,899,000	2,873,000
Total ...	8,110,000	10,022,000	8,211,000	5,065,000
Crop	—	10,461,000	8,680,000	5.489,000

Rio Exchange—7$\frac{31}{32}$d, previous day 7$\frac{15}{16}$d.

Havre, May 25.—Santos good average May opened quiet at 34$\frac{3}{4}$f. and closed quiet at 34$\frac{3}{4}$f., July opened at 35f. and closed at 35f.

Hamburg, May 25.—Good average Santos May opened quiet at 29$\frac{1}{4}$pf. and closed quiet at 29pf., September opened at 29$\frac{3}{4}$pf. and closed at 29$\frac{3}{4}$pf.

New York, May 24.—Closing prices of No. 7 Rio were as follow:—

	May	June.	July.	Aug.	Sept
May 24	... 5.00	5.00	5.10	5.20	5.25
May 23	... 5.00	5.00	5.10	5.20	5.25

COCOA.

The market is steady, though the absence of auctions keeps sales few. Guayaquil has received some attention and a fair quantity of Caraquez has sold at secret prices, also a small lot of Ceylon.

Import, Home Consumption, Export and Stock of Cocoa in London are as follows:—

		1899.	1898.	1897.	1896.
Imports, B.P.	bags	77695	88936	69909	78395
Foreign	...	31340	53730	29510	28277
Home Con., B.P	...	36447	48556	38518	34040
Foreign	...	24009	25720	27315	26691
Exports, B.P.	...	22107	14073	20721	17712
Foreign	...	13372	11747	16876	9627
Stock, B.P.	...	64724	86346	88546	92497
Foreign	..	46513	49763	45538	68324

PEPPER.

Black.—Very little business is passing. Singapore on the spot has sellers at 5$\frac{3}{8}$d, May-July (s.) at 5$\frac{9}{16}$d, and July-September at 5$\frac{5}{8}$d per lb.

White is also slow. Spot Singapore is quoted at 8$\frac{9}{16}$d. and arrive at 8$\frac{13}{16}$d; Penang on the spot has sold to a small extent 7$\frac{7}{8}$d cash or short prompt, and some for July-Sept. (s.) at 6$\frac{1}{2}$ per lb.

CINCHONIDINE.

Dealers here hold out for 10d. per oz., and a bid of a fraction under 8d. has been refused for 3,000 oz.

CINCHONA.

There was a good demand for the small supply offered in auction on Wednesday, and the bulk sold at full rates to a slight advance, the average unit working out at 1$\frac{5}{8}$d. to 1$\frac{3}{4}$d. per lb., and 2d. for cinchonidine. A parcel of 99 bales East India was withdrawn upon instructions from India. The catalogues offered by the six brokers consisted of:—

	Packages offered.			
East Indian cinchona ...	290,	of which	165	were sold.
Ceylon cinchona ...	245	„	245	„
South American cinchona	120	„	47	„
	655		457	

The following are the approximate quantities purchased by the principal buyers:—

	Lbs.
American and Italian factories	41,314
Amsterdam and Mannheim factories	26,663
Messrs. Howards & Sons	12,156
Brunswick factory	9,344
Paris factory	3,220
Druggists, &c.	6,060
Total quantity sold	98,757
Bought in or withdrawn ...	40,041
Total quantity offered	138,798

The following prices were paid:—

South American.—Bolivian cultivated Calisaya quill, fair, 9$\frac{3}{4}$d. a seron of damaged soft Colombian chips, 3d.; 21 bales of fi Cartagena were limited at 4$\frac{1}{2}$d. per lb.

Ceylon.—Succirubra, good rich chips, quilly, 7$\frac{1}{8}$d, to 5$\frac{1}{2}$d. f fair; medium. 4$\frac{1}{8}$d. to 4$\frac{3}{8}$d.; and fair root chips, 3$\frac{5}{8}$d. Officinal chips and shavings, 5$\frac{5}{8}$d to 6$\frac{7}{8}$d; renewed ditto, 4$\frac{1}{4}$d. to 6$\frac{1}{2}$d. per l

East Indian.—Good rich renewed Officinalis, chips and shaving 7$\frac{1}{2}$d to 7$\frac{1}{8}$d.; fair ditto, 4d. to 5$\frac{7}{8}$d; good quilly, 6$\frac{1}{2}$d. per lb.; fa red stem chips, 3$\frac{5}{8}$d.; ordinary renewed ditto, 3$\frac{1}{2}$d. to 4$\frac{3}{8}$d.; an medium to good druggists' quill, 5d. per lb.

The shipments from Ceylon for the week ending May 2 we 12,218 lbs. only, and from January 1 to May 2 they show the follo ing decrease:—

	1899.	1898.	1897.	1896.
Lbs. ...	251,937	284.371	273,569	441,370

The total weight of the 5,456 packages to be offered at Amste dam on June 8 is 481,80 · kilos.

QUININE.

Quinine has again shown more activity, at rising prices, an when the market opened on Tuesday small transactions were p through, mostly for August delivery, at 1s. 4$\frac{1}{2}$d. to 1s. 4$\frac{3}{4}$d., an a vance of 1d on Friday's prices; October delivery also chang hands at 1s. 5d. per oz. Wednesday saw an advance to 1s. 5d. f August, and 1s. 5$\frac{1}{4}$d. for October, with a fair business. To-day has been in good demand, and as high as 1s. 5d. spot has been pai June 1s 4$\frac{3}{4}$d. and August 1s. 5d. to 1s. 5$\frac{1}{4}$d.

INDIA RUBBER.

The market for Para has been rather firmer and up to 4s 2 was paid for June-July delivery, hard cure, but closes quiet wi sellers at this and possibly a shade less. For medium kinds the is little demand, and at auctions to-day almost everything w withdrawn, though small lots of Mollendo and New Guinea so well. All Central American scrappy Rubbers are considerab cheaper, being influenced by the decline in Para scrappies.

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-rly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, cluding postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will inserted for three issues for one rupee; non-Subscribers will be charged rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic currence will be *One Rupee* for each insertion, payable in advance.

P.B.—Remittance, should be sent to E. C. Duff & Co., Proprietors, anting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday the 30th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Coorg.

Polli Betta, 20*th June.*—*Weather.*—Heavy rain last week. On 14th, 1·80 in.; 15th, 2·45; 16th, 1·35; 17th, 2·50. From 11th to 17th inclusive about 11 inches. About 25 inches to date from 1st of January. Rain light on 18th, only ·60 inch; break set in yesterday, only ·03 inch of rain having fallen. *Plant Diseases.*—Coffee keeping fine. *Field Works.*—All seasonable works well forward. Some supply planting begun. *Labour.*—Plentiful. Canarese Mysore coolies coming in. *General Health.*—Continues good.

THE EXCHANGE PROBLEM IN BRAZIL.

There does not appear to be room for doubt as to the chief cause of the fall that has occurred in exchange in Brazil. In 1889 the paper currency of the country amounted to 198,815,562 milreis; at the end of 1897 it was 754,958,606 milreis. In 1889, exchange ranged between 26⅞*d.* and 28¼*d.* per milreis; in 1897, between 6⅞*d.* and 9⅛*d.* The regularity with which the appreciation and depreciation of the milreis has followed the reduction and increase of the paper currency is shown by Mr. Wileman in his book on "Brazilian Exchange." However much the amount of the paper currency varies, its *gold* value, calculated *per capita*, tends to be the same. The following

are the figures for the year previous and subsequent to the large issues of paper money in 1890 and 1891 :—

Year.	Total Paper Money in Circulation.	Exchange.	Paper Money in Circulation per Capita.		Population.
			Reis Currency.	Reis Gold.	
	Milreis.				
1885	207,861,450	$18\frac{15}{16}$	15$688	10$640	13,250,000
1886	213,582,588	20	15 809	12 086	13,500,000
1887	202,291,669	$22\frac{3}{8}$	14 712	12 186	13,750,000
1888	205,271,302	$25\frac{1}{4}$	14 662	13 640	14,000,000
1889	198,815,562	27	13 909	13 909	14,250,000
1892	555,825,964	$11\frac{15}{16}$	37 214	16 385	15.000,000
1893	646,917,750	$11\frac{1}{2}$	42 282	18 009	15,200,000
1894	703,825,960	$10\frac{1}{16}$	45 116	16 814	15,600,000
1895	789,464,096	10	49 316	18 265	16,000,000
1896	712,355,393	9	43 173	14 391	16.500,000
1897	754,958,606	8	44 409	13 158	17,000,000

This shows that the gold co-efficient of the currency in circulation *per capita* is now very much the same as it was previous to 1890. A very great reduction of the paper currency appears therefore to be essential to remedy its depreciation. Attempts are being made to apply the lesson taught by these figures. In December 1896 a law was passed, assigning the following funds to the redemption of the paper currency :—(*a*) The produce of the sale of a-third at least of the bonds which passed to the Treasury from the banks of issue, when the right of issue of private banks was extinguished and assumed solely by the Treasury. (*b*) Instalments of the debt of the Banco da Republica to the Treasury, including interest on cedulas. (*c*) Any budget surplus. (*d*) Part of the amount received from the lease of the State Railways. Owing to the Central Railway not having been leased, receipts from the latter source, instead of exceeding £5,000,000 as estimated, barely reached £200,000. The Banco da Republica only began in 1898 to pay the instalments of its debt. It has, however, paid the interest on the cedulas taken over by the Treasury, and this sum, amounting to 2,314,417 milreis, has been applied to the redemption. It has not been judged advisable as yet to sell the bonds referred to in (*a*). Part of the securities handed over to the Treasury by the bank in payment of its debt have been realised, notably the Leopoldina Railway debt to the bank, liquidated by the assignment of £700,000. These securities, it may be assumed, were not contemplated by the law of December, 1896. In any case the sum realised by the Treasury does not appear to have been applied to redeeming the paper currency, so that practically the law has remained ineffective.

Next to the excessive issues of paper currency, the balance of trade being unfavourable to Brazil has probably been the most important influence in depreciating the milreis. The official trade returns for 1897 show a balance of £5,184,564 in favour of exportation over importation, which in 1896 the balance was £9,004,125, and in 1893 the balance was £15,029,256, as shown in the following table :—

Year.	Exchange.	Value of Exports.		Value of Imports.	
		Currency.	Sterling.	Currency.	Sterling.
	d.	Milreis.	£	Milreis.	£
1893	13	606,052,000	32,827,826	328,589,000	17,798,57
1894	11	601,046,000	27,547,944	341,539,000	15,653,88
1895	10	696,360,000	29,015,000	370,087,000	15,420,29
1896	9	694,057,000	26,027,137	553,947,000	17,023,01
1897	$7\frac{23}{32}$	831,806,918	26,752,224	671,603,280	21,567,66

These figures which, though official, are probably n absolutely trustworthy, show a falling off in the value exports since 1893 of more than £6,000,000.

The Finance Minister calculates remittances in sterli to Europe for other purposes than payment of impor during 1897 at between £9,000,000 and £10,000,000, that taking the higher figure the balance against Bra for that year would be £4,815,436. These remittanc have not, probably, increased but decreased during th last few years for the following reasons :—(1) The retu of many Brazilians who lived abroad drawing the income from Brazil, on account of the fall in exchang (2) Diminution of number of Brazilians who travel Europe for the same reason. (3) Reduction in div dends of foreign companies, *e.g.*, the Rio de Janei Improvements Company, formerly paying good dividen on a share capital of more than £1,000,000, now pa nothing on its ordinary shares ; the Alagoas Railway Co pany, which has reduced its dividends from 5 per cent. 1896 to $3\frac{1}{4}$ per cent. in 1897, &c. (4) Diminution of profi of foreign importing houses. (5) The "Cabotagem" La prohibiting foreign vessels from taking in the coasti trade of Brazil.

ADULTERATED COFFEE IN THE UNITED STATE

The American authorities are looking very closely into t subject of the Adulteration of Food, and, as a natural co sequence, a good many newspaper paragraphs appear fr time to time referring to the matter. We do not think th too much credence should be attached to the most high coloured of these reports, or that Indian coffee-plante should run away with the idea that the abolition of adulte tion of coffee in the States would materially affect the value the true berry. It matters little to them, of course, whet the adulterant used is or is not injurious to health. T great aim must be to prevent the free use of materials t deteriorate quality. When we read that baked cereals a mixed with coffee, we judge that this is done in order reduce cost ; and this very reduction may possibly *help sell coffee*. Still, if coffee is to continue to be the natio drink of the States, it should be pure or only mixed with moderate quantity of such articles as chicory, and, wh mixed, it should not be sold as coffee. As the *Ameri Grocer* remarks, "Baked cereals may be a cheap a harmless adulterant of coffee, but coffee containing a lar proportion of chicory, peas, wheat, or other substa should be sold as a mixture : so designated that consume will know exactly what they buy." The same contemporary, however, regards as exaggerated the report of Ch

Chemist H. W. Wiley, of the United States Department of Agriculture, to the Senatorial Pure Food Investigating Committee, that fully 90 per cent. of the articles of food and drink manufactured and used in the country are frauds. As regards coffee in particular—which Dr. Wiley singled out as extensively adulterated—our contemporary says:—"The total imports of chicory represent less than two pounds to every 100 pounds of coffee imported. The manufacture of artificial coffee beans flourished for a few months and disappeared when coffee fell off in price; but at no time did their manufacture amount to any considerable quantity. In fact, there is little incentive to adulterate coffee, the bulk of which is sold in the bean. Ground coffee is undoubtedly adulterated with wholesome articles, but the proportion of such coffee to the total amount of coffee consumed is mere conjecture." The belief is also expressed that though, probably at some time or other, 90 per cent. of all articles of food have, to a greater or less extent, been adulterated, this is not the case to-day and that, if 90 per cent. of the *total number* were adulterated, probably less than 1 per cent. of the *total quantity* was adulterated and of this an infinitesimal quantity was harmfully adulterated.

THE DRAFT ALLOWANCE ON TEA.

Dealers in England have lost no time in declaring their attention to defend the 1-lb. draft on tea sales, if it be seriously attacked by importers. With Messrs. Densham & Sons at their head, practically all the leading London wholesale tea firms (with about three exceptions only) and over 330 provincial tea dealers, have signed the following protest, addressed to the Secretary, Indian Tea Association:—

London, May 23, 1899.

Dear Sir,—Our attention has been called to a circular and memorandum, issued by your Association, in conjunction with the Ceylon Association in London, to producers and importers of tea, containing a proposal to abolish the draft allowance on teas sold by public auction in London, and inviting support. In the memorandum it is stated that it would be to the interest of producers and importers that the proposal should be carried into effect, and that it has the unanimous approval of the Committee of the two Associations named. As this is a matter affecting, in a very serious way, the interests of the entire wholesale and retail tea trades, we feel that we cannot allow the circular to pass without entering a strong protest against the proposal which it contains. In opposition to the very trifling reasons advanced for the suggested alteration may be set a host of longstanding grievances under which those engaged in the tea trade in this country have been labouring for years, without being able to obtain the slightest satisfaction, mainly owing to the most unreasonable conditions of public sale. With regard to paragraph No. 8 in the memorandum, we submit that it is no argument to compare a duty-paid article like tea with bacon and cheese, as in the case of the former there is a very serious loss in the processes of handling, sampling and blending, and then again an additional waste in weighing in ordinary bulk form for general trade. This is accentuated when the retailer requires teas weighed out in small quantities, the total loss being much greater than the trifling and inadequate overdraft which it has hitherto been the custom from time immemorial to allow. Again, there is the regular loss through bad cooperage and broken, inferior lead, the latter resulting in the mixing of chips of wood with the tea, and the loss by percolation in transit. Another ever-present difficulty is that of extracting extraneous matter from teas, more especially nails, which results in considerable loss and inconvenience to dealers. What with cheesy teas, mouldy teas, badly bulked teas, teas smelling strongly of India rubber, apples, and other foreign substances, inferior returns in sample packages, and various other complaints with which the members of your Association must be well acquainted, if the suggestion to remove the last crumb of comfort is carried it will be the duty of the undersigned to take steps to protect their interests in a way which will very much outbalance any benefit which might be gained by the merchants in the abolition of the pound draft, *viz.*, by taking stringent measures to see that the conditions of sale are in every case followed to the letter, especially as regards bulking, so as to ensure teas being in every way equal to sale sample. United action will also be taken in an effective way to deal with Clause 5 of the conditions of sale, which in its present form is an utter impossibility to buyers. We request that you will place this letter before your Committee for their kind attention.

Here, a counter-attack is threatened, but the threat itself would appear to reflect a doubt whether the dealers are strong enough to stand against the importers this time, as they did many years ago when the same question of draft allowance was raised. The tone of the protest shows, nevertheless, that if they lose dealers will cherish resentment, and this would be most regrettable. A good understanding between sellers and buyers is essential to the success of trade operations, and it would, we think, be a pity for planters to press this draft question to an issue if, by doing so, they run the risk of setting dealers against them. The assertions of dealers about this allowance are very much to the point. One writer says:—"In 1896 we for six months carefully weighed gross and tare of hundreds of packages, and found in numerous cases that the 1-lb. draft was all but swallowed up, and in no case did any package contain one pound overweight, exclusive of draft. Nothing like 2,720,000 lbs. of tea, far less 5,000,000 lbs., is received and not paid for. We believe from our experience that in a rough-and-ready way the draft allowance does little more than square deficiencies."

Assuming the position of the impartial outsider who has looked facts in the face, "a London Jobber," writing to the *Grocer*, says "that he has come to the conclusion that the importers have justice on their side." But even he adds:—"Buyers when united can always beat the sellers. A buyer is not always obliged to buy, whereas a seller is always more or less obliged to sell; consequently buyers hold the reins, and doubtless importers will be compelled again to yield." It is hoped, we believe, that a conference will be held, and the subject thoroughly discussed by dealers, brokers and importers. We trust that by this means a satisfactory settlement will be arrived at.

THE TEA CAMPAIGN.

The *Times of Ceylon* has dragged us into the arena of its little sparring match with the *Madras Mail*, not "to see fair play," but as a supposed ally. We must disclaim the honour. Our contemporary introduces us in these terms:—"Meanwhile there is a little paper, known as *Planting Opinion*, which is produced much nearer to the planting districts of Southern India than the *Madras Mail*; and it does not back up the separation idea at all. It reproduces the first editorials on the subject; and is delighted that Travancore Associations are subscribing to the central fund." We need not go into the geographical question, as our greater proximity to the planting districts is a mere matter of yards, if not of inches. We would only say that when, some little time ago, we urged South Indian planters to push onwards, and to combine for the purpose, we were mostly in favour of *South Indian* combination. That we

approved of Travancore subscriptions to the I. T. A. is true. Better half a loaf than no bread at all. Our Colombo contemporary accuses our Madras neighbour of affecting a lack of perception after the former's statement that Ceylon wants the co-operative system revised because the present one is unfavourable to herself. But the *Mail's* question was to the point:—"If Ceylon has had less advantage than India out of co-operation up to the present time, why should she wish to continue a system that is unfavourable to herself?" It is, we think, absurd to suggest that India has reaped a greater advantage than Ceylon out of the joint efforts of their Commissioners. It is perfectly clear that Ceylon would not wish to continue co-operation, unless she saw something to be gained by it. As for South India, she is too small to help her big brethren materially, and, consequently, if she co-operates, can only expect to reap very small benefits, unless she attempts to get an unfair share on the sly. This would be a course unworthy of her. Of course, it is impossible for her to conduct a campaign on broad lines such as those of the Ceylon Planters' Association and the Indian Tea Association, but that she can quietly and at small cost bring her teas under the notice of buyers in various markets is beyond question. Hers cannot be a series of massed operations, where numerals count for nought so long as the battle is won. On the contrary, it must be the advance of a small but resolute body of men, bent upon making every shot tell, knowing that the "shot in the locker" is not over-plentiful.

TEA FROM SEED TO CUP IN SOUTHERN INDIA.

(By Thomas Brown, Glendale, Coonoor.)

III.

Felling, Clearing, Planting.—We have put the cost under these three headings at Rs.70 per acre and arrive at this figure as follows:—

	Rs.	a.	p.
Clearing and Burning	7	0	0
Lining and Cutting Pegs	3	0	0
Roads and Drains	10	0	0
Pitting 1,500 Pits	15	0	0
Planting do.	7	8	0
Nurseries	7	8	0
Covering in Pits @ 2/8	3	12	0
Cutting down secondary growth	5	0	0
Supervisors, etc., etc.	11	4	0
Total ...	70	0	0

Clearing.—Where there is heavy jungle to clear, the cost will run much higher, up to 25 rupees an acre, and such must be allowed for, but in such case the produce per acre will also be greater, and the profits a good deal higher. The felling must be begun about October, so that the burning can take place about February. If it is found impossible to open the whole 300 acres together, arrangements can be made to open 100 acres a year, and the cost divided up into three years; but it would be better, if possible, to open the whole 300 together, as the profits would then come in sooner. It is only a matter of organization and division of labour. A good maistry should be put in charge of each 100 acres and be made responsible for all the work connected with the opening of that hundred. The work after all cannot be as troublesome as the construction of a hundred miles of Railway!

Lining and Cutting Pegs.—Thousands of pegs, each 18 i long, should be previously prepared by each lining part A boy can cut 500 of these in a day if put on his mettle. W have contemplated planting 5 by 5, because the cost in eve way is lower, finer bushes are obtained, and hereafter th cost of pruning will be found to be far lower even per tre since standards and not bushes would be the rule. Th quality of leaf from bushes far apart is superior to tha from closely planted areas. For lining procure a half-inc cotton rope about 100 feet long and notch it 5 feet apa with pieces of red cloth. Run the rope as well as you ca north and south, using an ordinary magnetic compass f the purpose, and drive in a peg at each notch. Next, pla the rope east and west and check your angles by th geometric relation existing between the figures 3, 4 and *i.e.*, take three spaces on your base, four on the perpendicu lar, and close in or open out till you get five spaces on th third side Proceeding thus over the whole field, you wi have a very fairly lined field. Do not trouble to carry th line straight over a road, as this is difficult to do, causes los of time, and after all serves no useful purpose.

Coolies will not cut the pits exactly around the peg, no will it be possible in planting to get the plants in straight line. Attempts to accomplish these will break you heart; so don't try. It is quite enough if each plant ha its correct share of ground, and you will find that, after th bushes cover the ground, your lines look very correct. Th best laid out gardens we will guarantee have not the *stem* of the trees in a straight line. We have seen much valuabl time lost by attempts to get the plants in straight lines besides which the troubling of the coolies causes bad work Each plant must be hereafter put down as near the centr of the pit as possible, without reference to the others, in th same line. We have dealt thus at length with this point because it is one of those that give the young planter, anxiou to do well, endless concern and make his life a burden t him.

Roads and Drains.—These are put in at a gradient o 1 in 15 by the aid of a Ceylon road tracer, and are done b contract at the rate of 50 to 60 yards per rupee. Th roads are cut 3 feet into the solid, and so come out abou 5 feet wide. The drains are 18 inches deep on the lowe side, and all stones and roots must be carefully removed by the contractor. This removal makes the cost highe than it would be if such were not insisted on. Rocks mus be removed by blasting holes, for blasting usually cos 3 annas a foot. In tracing roads and drains, care mus be taken to avoid rocks, as the cost of opening will other wise be very much enhanced.

An acre of ground is roughly 70 yards by 70 yards, s that on the average one road through the centre and tw drains, one just above the road and one at foot (35 yard away) will give 210 yards to pay for, costing only 4 or rupees. Then probably one culvert will come in at a cos of Rs.3-12-0, leaving very little, it will be observed, fo blasting. Culverts are built for these narrow roads 6 fee wide. The excavation must first be made 6 feet by 6 fee by 5 feet deep at a cost of 10 annas to 12 annas. The bottom is flagged with flat stones, the sides builded up with walls 2 feet wide and 2 feet high, thus leaving a 2-foot waterway, then the whole is covered over with larg flat stones, the tops of which, it must be carefully noted are thus a full foot below road level. These culverts ar

usually most perfunctorily done by stone builders and cause endless trouble afterwards. The cost is As. 8 a running foot as against one Re.1 usually paid by public bodies. The total cubic contents of such a culvert is as follows :—

Basement 6 × 6 × 1	...	36 c. ft.
Side Walls 2 × 6 × 2 × 2	...	48 ,,
Top Cover 6 × 6 × 1	...	36 ,,
Total ...		120 ,,

or a little over 4 cubic yards. It has always been a puzzle to us why a man who will build you 4 cubic yards for Rs.1-8-0 in a revetment should demand Rs.3 for such a culvert. *Mamool,* unfortunately, is the plea, and we would commend these remarks to the special attention of Local Fund and P. W. D. Engineers. We have had hard work to bring the rate down to 8 annas in our early days of planting.

Pitting.—These we have always had cut 18 in. cube at Rs.10 per thousand, except on one occasion, when we tried the Ceylon plan of 9 in. by 18 in. *alavanga* holes, but found them not so suitable for a hard soil and short rainfall, although they appear to do very well in Ceylon. One never gets full dimensions at Rs.10 and shortcomings have to be winked at, if the labour is to keep on, or Rs.15 per thousand paid. The task for a roll-call cooly is 25 pits per day. The pitters all plead for expensive steel forks now-a-days for this work, and one must yield or pay a higher rate. One fork and one pitting bar to two men answers.

Covering in.—Before this work is undertaken, we should advise a good hoeing at Rs.3-4-0 per acre to be done, to clear off sods, some stumps, and to loosen the soil. The cost has been provided under a separate heading. Care must be taken not to return the same soil to the pit and that the edges of the pits are not broken down to make quick easy work. No rubbish of any sort, grass roots, stumps, ferns, stones, &c., must be allowed into the pits. A mound of about 9 inches depth must be made over each pit, to provide for shrinkage and to mark the spot.

Planting.—This is the most important work of all and it is almost impossible to have it well done. Before removing plants from nurseries, flood the beds well, then dig a trench at foot and fork down line by line of plants carefully. Allow all earth that will fall off to go, and dip the roots in liquid cowdung. Teach the women to dig a hole with a wall at further end and a sloping bank on near side. Then holding the plant with the left hand against the wall, throw in earth, so that the roots are carried downwards. Great care must be taken to see that the collar of the plant is not buried in the earth. The earth must be finally rammed well home by the feet, while the plant is held in the hand. The shading must be very light, six to eight ferns being all that is needed. On the average 50 plants per cooly can be put down and shaded. A heavier task results in bad work. Very wet days must be avoided. All plants not fit to go out can be at once put into bamboo pottles for vacancy planting the following season, and for this purpose pottles should be provided beforehand. Plant each plant in the centre of its pit, without reference to its being in straight line. As before stated, this matter need give no concern whatever, if the lining has been correctly done.

NOTES.

The Calcutta Tea Sales. At the sale on 16th instant, the fifth of the season—12,000 packages were offered, and 11,000 sold. Qualities inferior, common, and medium were one to two pies lower; good teas firm.

Coffee in Italy. In 1898 Genoa imported 6,567 tons of coffee, as against 6,524 in 1897; Of the former total, 5,494 tons were from Central America. It would be interesting to know if Indian planters have ever seriously "attacked" this market.

Tea in the Philippines. Mr. T. H. Stephens, who is practising his profession as dentist in Manilla, says "he can get land cheap for anyone requiring it in the Philippines." He himself is introducing tea there; but he believes in coffee as well.

An Excess of Labour n B. C. Africa. Thus the *B. C. African Times* :— "Cholo is actually turning away labour! This in itself is an index of the state of the labour market which is keeping up splendidly. Planters should take the opportunity to keep wages to their normal level."

Colombo Tea Sale. At Colombo on the 14th instant about 11,820 pkgs. = 941,111 lbs. were offered, of which about 10,399 pkgs. = 826,802 lbs. were sold. At the auction, common teas were rather firmer. Broken Pekoes, however, were not so much sought after and declined somewhat. Among the finest teas in the sale were: Devonford, Monkswood, and Iona.

The Draft Allowance on Tea. A telegram, dated London, 13th instant, to the *Times of Ceylon,* states that a special mass meeting has been held against the proposed abolition of the 1-lb. draft allowance on tea. There was a great attendance of dealers; and the Lord Mayor Sir John Voce Moore) presided. A motion in favour of the draft allowance was carried.

Effect of Insecticides on Seeds. It is often desirable to soak seeds in some solution to prevent their destruction by such pests as gophers and the like. The Kansas experiment station finds that this soaking is in no way detrimental to the germinating qualities of the seeds. On the contrary, there was an increase in the percentage which germinated.

The London Tea Market. Cabling to Colombo on the 15th instant, Messrs. Gow, Wilson & Stanton reported a weak market, teas with quality steady. Average of Ceylon tea 7½*d.* (¼*d.* down). Reuter states that 24,000 packages Ceylons were sold out of 26,000 offered. Of Indian 11,000 sold out of 12,000 offered; average 8⅛*d.* The new season's Indian teas are said to be of poor quality.

Tea in Natal. The consumption of tea per head in England is 6 lbs. per annum. The production for Natal is computed at 1,000,000 lbs. per annum, says the *Mercury*. The white population of Natal is 50,000; at 6 lbs. per head the consumption in Natal is 300,000 lbs. per annum, leaving 700,000 lbs. for export. The average retail price for tea in Natal is 1s. 5d. per lb.; hence £21,250 is spent annually in tea by a population of 50,000.

Sale of Para Rubber Seed at Colombo. On 17th instant 250,000 Pará rubber seeds were put up for sale. Messrs. Forbes and Walker bought 12 lots of 10,000 each—9 lots at Rs.15 each, one at Rs.14, one at Rs.13, and one at Rs.12. Messrs. Geo. Stewart & Co. bought 7 lots—5 lots at Rs.16 each and two at Rs.15. Messrs. Lee, Hedges & Co. bought 3 lots at Rs.16 each. The other three were bought by Messrs. Whittall & Co. at Rs.15, Rs.16, and Rs.17 each respectively.

China Tea in the United States. During the ten years 1889—98 the imports of tea from China were 468,441,681 pounds—a yearly average of 46,844,168 pounds. The maximum import was in 1897, when it reached 56,524,546 pounds; the minimum in 1898, when it fell to 39,754,736 pounds. For the four years 1894—98 the average was 53,136,559 pounds, against a yearly average of 42,621,884 pounds for the four years 1889—92. These figures show a gain of over 25 per cent. within the nine years 1889—97.

Cinchona and Quinine. In the Dutch bark auctions to be held on the 8th instant, 5,456 packages were to be offered for sale, with an average of 5·35 per cent. of quinine. At Hamburg on the 1st instant, business was done in sulphate of quinine at 43m per kilo second-hand. On 23rd May the New York market was reported to be improving, sales having taken place to the amount of nearly 100,000 oz. at from 29 to 32 cents.; but on 11th June the market was quiet, quinine 34 cents. in second-hands, firmly held. Cinchonidine 25 cents. per oz.

Fine Coffee recommended. The following advice given by the *American Grocer* to its readers should interest those planters who have been able to maintain a high standard of quality in their coffee crops:—"A high standard is an absolute requirement if a good trade in coffee is to be won and held. It means a high-grade raw bean, fresh roasted every day. Educate customers to buy high-grade bulk coffee. Once tickle the palate and price will have little consideration with the lover of a good cup of coffee."

Tea in France. Following the desire to be up to date as in London, the Parisians are taking—rather slowly, it must be admitted,—to tea, not as a decoction for invalids, but as a drink to be taken with food. Confectioners are inviting their customers to afternoon tea, and there is at length some prospect of tea becoming popular. Now is the time, says the *Home and Colonial Mail*, for developing the French taste for tea, and pushing the Indian and Ceylon product, for most of the tea sold at present in France is indescribably bad and very dear.

Coffee in the Western States of America. Mr. C. E. Bickford, San Francisco, reports Pacific coast sales of coffee in April at 60,311 bags. The stock in first hands on May 6 was 26,944 bags Central American. Prime to fancy washed Guatemala and Mexican coffee sold from 14½ to 17 cents.; strictly good at 13 cents.; fully 7½ cents below what similar grade brought in 1895. Prime washed Costa Rica 15 cents. The prices obtained at recent sales were from 4¾ cents. for very inferior Guatemala; 5 cents. for inferior Salvador, up to 17 cents. for fancy washed Guatemala.

Coffee in the Philippines. It is reported that Mr. Donaldson-Sim finds that Benquet is a splendid place for plantations. He has over 8,000 coffee trees bearing excellently, besides some 30,000 tea seedlings and some 3,000 full-grown tea plants, bearing well and ready for picking. He has one of the best plantations in northern Luzon. He has practically no neighbours, that is to say, there is no other plantation anywhere near his, and the nearest village is about four or five miles away. His place is several hundred feet higher than the village, and is 4,600 feet above sea-level. He has done a good deal of experimental planting with other things with promising results.

The Sugar-Coffee War in America. The *American Grocer* says:—The conflict between the Sugar Trust and Arbuckle Brothers is centreing here in the East, where prior to the war package coffee had a very limited sale. Very heavy advertising is being done by the rival interests to create a demand for package coffee. The Woolson Spice Company is now operating a roasting establishment in Brooklyn, and the war never was more vigorous than at present. The profit is pretty well out of sugar refining and cut to narrow margins on coffee, with the benefits, if there are any, going to the consumers.

A living Advertisement for Ceylon-Indian Tea. Thus the *American Grocer*:—A. Nicholson, of New York, resident representative of the Ceylon and India tea growers, was a welcome visitor among the "trade" here last week. Mr. Nicholson is a worthy specimen of our English cousins, and if he has thus developed by the stimulating effects of Ceylon-India tea, he presents in his physical and social qualities a "big card" to encourage its more general use. Mr. Nicholson states that the sales of the above tea in Philadelphia are in the proportion of 500 chests as against 5 chests five years ago. Coupling the above facts, we shall certainly look for a generation of Quaker giants when our growing tea-drinkers shall mature.

Thefts of Prædial Products in Ceylon. The Planters' Association of Ceylon lately passed a resolution urging that additional protection, either on

ne lines of the Madras Act, or by extending the provisions f Ordinances No. 9 of 1885, No. 2 of 1886 and No. 4 of 891, might be afforded to cacao and cardamom planters n view of the great extent to which thefts of these pro- ucts are now carried on. His Excellency the Governor as given the matter his most careful consideration, and as now expressed the opinion that fresh legislation should ot be resorted to, until the provisions of part 3 of Ordi- ance No. 16 of 1865, relating to Police in rural districts, ave been fairly tried and proved to have failed.

ne China Tea Trade. Hankow advices of 23rd May referred to settlements of 339,000 alf-chests against 204,000 half-chests for the same number days last year. The laying down cost of common Congou as 6¼d., about 1¼d. dearer than last year." On 25th idem was reported :—The continued fine weather has enabled amen to bring their produce to market early and in good ndition. Common grades have been in strong demand at e advance noted in our last issue, and the present range prices is much higher than we have been accustomed to modern times. It must, however, be borne in mind that, late years, damaged tea has added largely to the stock of *mmon*, a source of supply which, happily, does not exist present, such variety being conspicuous by its absence.

azilian Coffee. New crop Santos was expected at port of shipment early this month. gentleman who was through the new coffee district as as Ribeirao Preto, early in April, tells the *Rio News*, t the coffee plantations are in splendid condition and loaded with fruit. The crop will be a very large one. mmenting on an estimate in the papers of two million gs, one gentleman in that locality said it was likely to be millions. Ten years ago the country was quite new and coffee trees were to be seen ; now, said our informant, whole country is covered with splendid coffee orchards, l trees are just reaching their best bearing age. Advices the same paper, from one of the interior coffee districts S. Paolo. are to the effect that the growing crop is well wn and of better quality than last year. There has n plenty of rain, not too much, and now fine weather is nted for the picking, which began April 17.

ans and Congous. A New York paper says :—"Cable advices received from Japan, dated y 13, say that there continued an active speculative nand, the settlements to that date being 32,000 piculs, inst 28,000 piculs for the same period last year. spite, however, the active demand, prices have weakened htly, but, at the lower prices, there has been no buying importance for the United States nor Canada. The an crop, according to the latest information received, be about the same as last year. Recent cable advices that the market for Congou tea at Hankow has opened that there is a good demand for the common grades, gland being the principal buyer No particulars, how- , were learned as to the amount of tea thus far settled prices paid. The North China Congou crop, according he advices received, promises to be somewhat larger last year. Locally, there was a small and uninterest- market. The volume of line business transacted was of dedly limited proportions, as jobbers generally confined their purchases to only such supplies as were absolutely needed to meet current wants. Still, as there was no pressure to sell, values held to a steady basis, particularly for the common grades."

Dirt in Tea. A quite unpremeditated support to the grocers' contention, that the pound draft on tea is needed to cover various odd defects found in that article as purchased, is afforded by the paper, *Commercial Intelligence*, which prints an article with the scare-head "Dirt in Tea." According to this authority, "large importations of very inferior goods rejected by the Hamburg and New York Customs have been passed by the English Customs and sold in London. A large amount of this tea is quite unfit for consumption, and the caper and dust teas now contain up to 20 per cent. of earthy matter and sand." The paper goes on to assert that—"Samples of tea, passed by the Customs inspectors and still stored in bond, have been analysed and found to contain mineral matter varying from 10 to 20 per cent., or sand up to 14," and that "the Tea Associations will have to stamp out those practices at once, or the Mincinglane market will be seriously affected."

The "Chemist and Druggist" on the Tea Market. Portions of the following paragraph from the last number of the *Chemist and Druggist* to hand are almost prophetic :—"The tea market has been dull and dragging all through May and prices of common leaf Assam and Ceylon show a drop of about 1¼*d.* per lb. from the highest point about Easter. It is, however, only the quietness of the country demand which keeps prices down. Retailers and blenders are only buying what they are compelled to buy under the evident impression that prices are not likely to go up much, and that if they go down they may go down a good deal The position is still a very strong one : deliveries keep up fairly well in spite of high prices, and arrivals are very moderate and cannot be heavy for another couple of months. Sound sweet leaf Ceylon for price can be bought at 7*d.*, though with difficulty, and a little extra demand would send the price up to 7¼*d.* to 7½*d.* directly. Lower grades of Assam are in very small supply, and while commonest leaf Assam would fetch 7*d.* to 7¼*d.* in sale, there is practically none offering. Better Indians are getting very scarce indeed, and buyers will be well advised to cover their requirements for the next two months fully. Ceylons about 8*d.* to 10*d.* are the only sorts that can be described as showing really good value at the present time. Fine teas with flavour, and quality, and character can be bought at this range, though they are a bit too light in liquor to be used freely."

English Imports of Honey. During the past five years the annual importation of honey into the United Kingdom has averaged 2.250,000 cwt., of the declared value of 31,000*l.*, or about 3¼*d.* per lb. Among the principal countries supplying this are the United States, Chili, and Peru, the other contributors including the British West Indies, France, Australasia, Canada, Germany, Italy, and the Spanish West Indies. From the United States we receive about one-third of the total quantity imported, and about the same proportion is furnished conjointly by Chili and Peru. No particulars are available as to the

production of honey in the United States since 1890, when the yield from the hives then in existence was nearly 553,000 cwt. in the twelve months, the production of beeswax in the same period being 10,000 cwt. Most of the honey exported from the United States is shipped to Great Britain. In France, returns relating to apiculture are annually collected by the Ministry of Agriculture. The production of honey in 1896 was estimated at 17,000,000 lbs., which was somewhat above the average. There is an average exportation of about 20,000 cwt. of French honey annually, of which the greater part is sent to Belgium and Holland. The decennial inquiries of 1862, 1872, 1882, and 1892, indicate a considerable falling-off in the French production during the past thirty years. It is estimated that the annual production of honey in Russia is about 321,000 cwt., which, however, is not sufficient for home-consumption, as that country imports wax and honey.

GENERAL ARTICLES.

EUREKA.

BACTERIA TO THE RESCUE.

Mr. J. W. Moir of Landerdale, Ulanje, has been writing on this subject in the *B. C. African Times*. In one paper he discusses the nitrifying bacteria in the soil and the useful work they do. He then refers to another class of bacteria that may be enlisted in almost more important operations. He adds:—

It has long been known that leguminous, or pea and pod bearing plants, such as beans and clover, leave a field better able than before to produce cereals, etc., even although large quantities of pulse and clover-hay have been taken from it. The scientific reason has been recently discovered. Nodules or growths, formed on the roots of such plants, are found to be highly nitrogenous. The roots with these tubercles leave the soil richer in combined nitrogen than it was before the legumes were planted. The reason is that a valuable bacterium, Bacillus Radicicola, has lodged itself in myriads in these nodules, and has there been able to absorb free nitrogen from the air which permeates the soil. Combining it with other elements it passes it on to its host as ready-made albuminoid matter, perfectly available for the plants nitrogenous tissues. Seeing that the most costly manure is thus specially provided for them by their guests, it is little wonder that the pea tribe is very rich in nitrogen: peas and beans are among the most flesh-forming of foods, while the stalks and leaves also contain combined nitrogen. There has naturally been an increase in the planting of leguminous plants: and not only so but enterprising Germans have bred and propagated the bacillus, in order to have whole families of them waiting the advent of the tiny roots of the plants sown at the same time as themselves. They further found, when breeding them, that a pea-bacillus did not take kindly to a bean or vetch or clover rootlet. So the bacilli nursery men have made separate pure cultures, commercially known as Nitragin, for each legume grown by farmers. . . .

Now, if we could induce myriads of these bacilli to labour for every coffee plant we have, we should soon see the latter brighten under the treatment; the leaves grow greener with better-fed chlorophyl; the seeds finer and bigger with more albumen. But the little wretches will have nothing to say to a coffee root; although indeed another German firm advertises a bacillus to enable cereals to assimilate free nitrogen. Later, this latter gentlemen may do us good, perhaps working in the soil in combination or even in competition with the bacteria that nitrify organic matter. Leaving him apart till his capabilities are really established we can at once try to entrap that atomic chemist the Bacillus Radicicola. We must provide a suitable dwelling-place, amply supplied and furnished, and he will soon be there with chemicals and re-agents, to start work in his diminutive laboratory. In other words we can plant leguminous trees and crops, always remembering that there must be a sufficiency of soluble mineral riches such as phosphoric acid, potash and lime, in order that the plants may be able to utilise the products of the said laboratories.

First, as Shade trees, we can try Albizzia (Moluccana, the native Chikwani) Inga, Pithecolobium Saman, Pteroc (Mlombwa), Acacia, Erythrina, with many indigenous trees. among these last a few trees exist which, if planted among coffee, would shortly do a world of good to the owners I feel cer The discoverer, or rather the discerner, of such a tree woul much to place our coffee planting on a securer and better pa basis. All our planters and the administration Botanists sho keep this constantly in view: especially because any exper dealing with trees takes so long to yield definite results.

The quickest way of arriving at helpful conclusions on important point is by leaving, when felling forest for coffee, many trees as are not known to be bad, and the trees which nati are accustomed to leave in their own gardens. Any tree with well known compound leaves (that is, leaves formed of a long s or petiole with little leaflets arranged on each side) while leaves themselves are arranged alternately, any tree with pea-flowers, should receive special attention. Careful and pati study of the effects of such trees, and of trees bordering the co would surely reveal to a body of men like the planters of B. C most useful results. In addition to the benefits of other shad subject I must not touch on at present, all leguminous t probably would, by the aid of their baccilli, be constantly add to the nitrogenous richness of the soil. At the same time m such trees may so rob the coffee of water, or of potash, phosph acid and lime, as to harm instead of helping it. Such I found pra cally to be the case with Kampone, a leguminous tree with a large tap-root. Its enormous system of far-spreading sur feeders however did much more mischief than its shade and duce did good, and all had to come down.

But there is a second and readier way of enlisting the service our little chemical friends. It is by green-manuring, by sow the leguminous crop between our coffee, to be dug into the s preferably just when in full flower. This will give to our co roots, nodules, leaves, and a large supply of the best matters cumulated for the coming embryo. Or, to be more accurate, it hand these over to the nitrifying bacteria of the soil to be m into nitrates for the coffee. Of course the mineral constituents the green manure are also stored handily for the coffee.

I have made many experiments in this direction also, bu began foolishly by sowing imported seed. I put in large acreage lucerne which with its deep-reaching roots was to bring me wea from the sub-soil. But, alas! it all came to nothing. Perhaps Central African Bacillus Radicicola had not time to be accusto to the flavour of its roots and it stands to reason that a legumi plant, that has been dependent for centuries on special laborato where part of its food was cooked for it on the premises, ca get on without this help, like a less civilised "critter" that always been accustomed to do its own catering. No, we want digenous plants that will find bacilli ready to help them. S years ago I planted the common Nandolo (or Mbelemende be cutting it down and burying it; and though unfortunately, ow to my absence at home and the death of my assistant Mr. Thomp I did not get any definite report on the crop, the boundaries of application are still traceable by the healthier looking coffee. years ago therefore I planted about one hundred acres of this b a plant between every coffee bush in the rows; but far too lat the season as experience seems to prove and it is only being down now, so that there are no definite results to report. year I planted ground-nuts, some food beans, and some of much bepraised florida velvet bean (*Mucuna pruriens*, var.)

There are three problems to be solved. What is the most fitable legume, when should they be planted, and when dug in

As to the first, we have a most abundant selection. There are beans, beans for fish-poisoning, beans in the bush. The habi the plant must be taken into account. Creepers that w throttle our coffee won't do, otherwise, perhaps, the Chitedzi, brother to the velvet bean, might do. But the Chimbamba, o Red River bean, the Nyemba, a small brown bean, the Nt ground-nut, the Nzama or ground bean, the Nkwanje (or g seem particularly promising The Ombwa a fish poison merits a trial as does the Gwingwizo to a lesser extent.

As to the second, I think now that they should be plan early as possible with the natives' early maize, although I ha tried this yet. They would thus get the full benefit of the

growing season, would contend with the growth of more useless weeds, and would help to prevent wash.

As to the third problem, I am in doubt as to whether there should be one or more cuttings and also as to the very best time. The plants should be cut down if possible when in full bloom as they are then richest in plant food. In any case it should be before the end of the rains or when there is ample moisture in the soil to ensure thorough disintegration by rotting. They should be buried with plently soil; that is they should not be crushed into little pits. Rather good large trenches should be dug and the green manure mixed with as much soil as possible when filling in.

Though the last operation would entail expense, the largely increased crops and the improvement in quality for several subsequent years should leave a very large margin of profit. For combined in the above operations, you have such cultivation of the soil as liberates its mineral riches, induces air to penetrate and retains almost a maximum of moisture to carry the coffee triumphantly through the dry season, besides providing abundance of every requisite plant food.

PRICE £1000.

Another Central African writer, Mr. Kenneth J. Cameron, of Namasi, discourses thusly, taking as his text his Bangalore namesake's report on his visit to Coorg:—

At no time since I have had anything to do with the cultivation of coffee have our prospects for the future seemed brighter. At present we have low prices, but that is no reason why they should continue so. I have read over carefully the extract "On Soil, Moisture and Irrigation," and can see nothing in it which specially refers to coffee cultivation in B. C. A. On the other hand, taking Mr Cameron's address to the planters of South Coorg, as you and a few others are already aware of my views on cultivation, I can say "Amen" to all that has been stated. You think that because Mr. Cameron has been trained as a gardener and by that training should have some knowledge of Agriculture, Horticulture, and Arboriculture. Therefore you assume that he should not have the same authority as a coffee planter who has received a special training in coffee, and is therefore a specialist. How many planters in India have served their apprenticeship on a coffee plantation? Very few. Some are farmers' sons who have served some time in a lawyer's office, a few others are gardeners, etc. It would be more favourable to the cultivation of tea and coffee if there was a special training. As a rule one of the greatest recommendations to tea and coffee cultivation is a knowledge of book-keeping, the native is supposed to look after the cultivation. Gardeners again have not all received the same training. All gardens are not alike. One may be a mere vegetable garden, another fruit, and another cultivation under glass, one may be large and include all departments, and the other small and include only a few. A gardener may serve his apprenticeship of three years and then go abroad.

Has he the same training that another gardener has who served three years as apprentice, and after that has served other three years or more as journeyman and in different gardens?

Taking the views of the few gardeners in this country they all seem to recommend trenching before and after planting coffee.

I have had a little experience in fruit tree growing as it is done in the old country, both under glass and outside, I have never seen trenching or digging among fruit trees or bushes that were established.

There are two or three inches of the surface upon which manure has been spread turned over in the winter time with the spade and in Scotland, if I remember rightly, the process is called "pointing." The spade is held almost horizontal and the surface skinned the length of the blade and turned upside down.

This work is more tiresome than digging as the gardener's back suffers more having to be always in a bent position.

In all fruit tree growing outside (that is, not under glass) the roots are trained so as to be near the surface.

This is to keep them under control, to keep them from the too damp soil underneath, and so as they may be easier fed.

Manure put on the surface does not penetrate deep, as the soil is a good filter and retains the greater part of what comes out of the manure near the surface.

Sometimes stones, slates and even pavements are constructed and placed below fruit trees to prevent the roots going direct down. Fruit trees at home do not grow in the winter time, and they can then be lifted as soon as their leaves droop so as to prune their roots, which are never allowed to go direct down or to travel too far; they have therefore numerous fibrous roots near the stem and in this way are much easier transplanted should they be too crowded, and at the same time manured or fresh soil given them.

But what is done at home or in California need not always be a guide for us here.

At home in ordinary cultivation such as vegetables, cereals, etc., the soil is dug generally in the winter time and put up rough as it falls off the spade or is turned over by a plough and never broken then. The reason for this is that there is more surface exposed to the frost and in the spring time it dries sooner, it is then forked and raked or in the field it is harrowed. In the spring time we have to wait till the sun dries the soil sufficiently before planting or sowing, and the rougher it is dug the sooner it dries. Here we have to wait until the soil is sufficiently wet, which is quite the opposite to what is done at home and perhaps in California Is the climate of California not more like the climate of Britain than it is to B. C. A.?

Now, take a plantation not far from here, which was trenched. The soil was turned over in large clods and never broken, the fact is the soil contained more clay than anything else and it would take more labour to break the clods than it would to trench it. The plantation presented the appearance of a brick field with the bricks set out to dry. Now what quantity of roots were broken in the trenching of such a plantation? Seeing the soil was stiff clay the roots would not run through but get broken as the soil was turned over. It is my opinion that if the roots are never touched that you will find in the first eight or ten inches of the surface soil more fibrous roots than you will find below that depth. To me it would appear that planters were preparing for a root crop such as carrots, parsnips, beets, or such roots that expand so much in the soil. with the large pits they make and the trenching afterwards. I should say that the larger the pit was made and the less the soil was firmed the sooner it would dry in the dry season. The smaller the pit and if made reasonably firm the greater the chance is that it would keep damp much longer.

Take two flower pots, give them equal drainage, fill them with soil, one with the soil put in loose, the other with the soil firm. plunge them for a night in water. Take them out and let them dry. The one with the soil loose represents cultivated soil, the one with the firm soil represents uncultivated. The pot with the cultivated soil holds the greatest percentage of water, the other a much less percentage. Now at the end of seven days, which pot will hold the greater percentage of water? Take any plantation in B. C. A., make a pit a foot deep and six inches in diameter, plant your seedling coffee, and I believe it will grow as successfully as others that had prepared for them much larger pits.

It is very difficult to compress water, and soil porous enough to receive water should also be difficult to compress. I cannot see what we are to gain by this digging and trenching.

I have no doubt but some soils are naturally more fertile as you go below the surface than others. I was coming down Ndirande just lately and met Mr. Walker who gave me his reasons for selecting his estate there. He lifted a piece of decomposed granite and said that he believed that soil containing it was good soil for coffee and told me that Sharrer's Estates near Ndirande, Lunzu, Chipande and Chirâdzulu, had the same soil. You will notice this excavation through decomposed yellow granite on the road before you come down to Mr. Walker's place, the native trees, with only about one foot of soil on the top of this granite, are flourishing the same as if it was pure soil. One would wonder how they live through the dry season. About a week after I met Mr. Walker I was down at Gala estate and Mr. Robertson took me to see his best coffee (the largest trees and the heaviest crop); they were growing among rocks and as I saw the pits made I know they were dug out of yellow decomposed granite, the rock just soft enough to be cut by the hoe, and what was more wonderful still the coffee had stood the drought better than any coffee in the plantation. "The nearer the bone the sweeter the flesh, and the nearer the stone the sweeter the grass."

Now I suppose you will put this down as nonsense and tell me that I have not proved that such is the case. I will tell you a few facts which I can give positive proof for. The cultivation of coffee in B. C. A, will remain a failure if we continue as we are doing. No amount of pitdigging, no amount of trenching, no amount of irrigation, no amount of rain, no amount of pruning, and no amount

of shade, will save us. What is to be done? Well, we have all this time been working in the dark. We may get a few crops off a young plantation but for a certain reason that plantation will ultimately produce light berry, chipped berry, or spotted berry, not because the soil is exhausted, not for want of manure, not for the want of rain, although the want of rain is a good bit to blame it may not be the cause of the greatest damage. What then has to be done? I am quite willing to explain this mystery upon condition that I receive a cheque for one thousand pounds. After that it shall be "Light in Darkness." You may think the sum large, but if you make a turnover of the same amount or more from your first crop after following my directions, it is then only quite a trifle and you will never miss it. It is quite a small sum in comparison to the reward offered by the North Charterland Company and it may pay us better than a gold mine. It will also save a lot of labour in the picking of the bad beans. The sooner this is settled the greater good it will do the coffee industry and B. C. A. in particular.

CANADA'S DIRECT IMPORTATION TEA TRADE.

The *Canadian Grocer* says:—Canada fairly well distributes her patronage for the various descriptions of teas, although, as every grocer is aware, increased attention is being given to the importation of Indian and Ceylon teas.

The countries from which we chiefly import are Great Britain, China, Japan and the British East Indies. What we get from the United States is very little compared with that brought direct from the countries of production or that bought in bond and imported from Great Britain.

During the last few years there has been an increasing tendency on the part of the trade to import direct from the countries of production. Two causes have chiefly contributed to this. The one is the tariff, which only permits tea to be imported duty free on condition that it comes direct from the country of production, or is bought in bond in Great Britain and is accompanied with a certificate showing that same has passed inspection there as being fit for home consumption. Tea otherwise brought in is subject to a duty of 10 per cent.

The accompanying table gives the importation of tea during the past nine years. The totals do not describe exactly all the importations for each year, but they practically do, as the figures which are eliminated relate to imports from such countries, for instance, as France and Germany, and are too insignificant to be included:

	1898.	1897.	1896.	1895.	1894.
Great Britain ...	4,133,598	7,064,333	5,487,162	6,265,409	6,218,680
United States ...	521,234	252,475	238,153	849,669	221,332
China ...	3,623,616	5,418,809	5,339,748	4,437,761	4,509,374
Japan ...	8,953,186	9,164,582	10,051,516	9,081,915	8,359,885
Brit. East Indies.	2,769,961	2,406,606	1,531,214	492,011	164,518
Total lbs. ...	20,001,595	24,306,805	22,647,793	21,126,765	19,473,789

	1893	1892.	1891.	1890
Great Britain ...	7,307,389	7,110,065	7,306,768	7,905,830
United States ...	202,428	564,916	161,123	759,170
China	2,871,466	2,766,133	2,426,123	2,195,898
Japan	7,697,545	11,961,317	7,090,461	7,462,674
Brit. East Indies ...	86,616	188,416	154,159	127,611
Total lbs.	18,165,444	22,590,847	17,138,634	18,451,183

The imports last year were abnormally small, because, during the previous year, they were abnormally large, owing to the anticipated but unrealized duty

The most striking feature in the above table is the large increase in the direct importation of tea from the British East Indies, which comprise both Indian and Ceylon teas, the returns not giving separate figures for these respective countries.

This increase in the nine-year period is over 2,000 per cent.

Although the consumption of China teas is gradually falling off in Canada, the average importations direct, according to the above figures, would rather indicate that they were being well maintained, but these figures are favourable, because we are importing more teas direct than we were even six years ago and less indirect. In other words, while our direct importations of China tea during the past five years have averaged more than during the previous fi years, shown in the table, the total importation has been less.

Unfortunately, these changed conditions in regard to the dir importation of both British East Indian and China teas have be at the expense of the exporters in Great Britain. At the sa time, however, it cannot be helped, and, with the excellent stea ship service which Canada has now on the Pacific plying betwe Chinese and Japanese ports, it is only natural. This direct stea ship service has, no doubt, also tended to maintain the uniform of the importation of Japan tea during the past five years.

There is one extraordinary fact in regard to the direct impor tion of Japan tea, and that is that the average annual proportion the total of all teas imported was the same for the two-year per of 1897-98 as for that of 1890-91, namely, 40·89.

Taking China teas, the average direct annual importation for t two-year periods was 12·98 and 20·40, an increase of 7·42 per ce in favor of the 1897-98 period. The average direct importation British East Indian teas for the two-year period of 1890-91 w slightly less than 4/5 of 1 per cent. of the total. By the two-ye period of 1897-98 the average had risen to about 11·7 per cent.

From Great Britain, the average annual importation for th two-year period fell from 42·43 per cent. in 1890-91 to 257·27 p cent in 1897-98.

We have not attempted to deal with the proportion of black a green tea imported during the nine years, but may do so in a su sequent issue.

COFFEE PROSPECTS IN SOUTH INDIA.

"Planter" writes to the *Madras Mail*:—

How Indian Planters will stand the low prices now ruling in t market is a question of interest not only to investors, proprieto and superintendents, but also to members of the outside pub who may contemplate bringing out sons or relations to earn living by planting. By way of an answer to this question, I cann do better than take a rough outline of the prices of coffee n ruling, the working expenses and the crop to be expected on place of, say, 120 acres. Taking the different items separately, have worked out below a set of figures which I am sorry to s will frighten even the most sanguine. The working expenses different estates differ so considerably that it is hard to arrive even an estimate. Whereas some planters have spent as much Rs.250 per acre, others have spent next to nothing. As a rul expenses vary between Rs.50 and Rs.150, so if I put workin expenses down at Rs. 100 per acre, it would be a fair estimat Crops differ every year, but the average of several estates publish some time ago came to about 3 cwts. per acre—of course some f estates could show five or even six cwts. per acre, but these a exceptionally favoured. The local prices now being offered ran from Rs.6-8 to Rs.7-8 per bushel, or Rs.650 to Rs.750 per t (some outturns run as low as 68 bushels per ton, notably on th Shevaroy estates, others run as high as 120 bushels per ton—aft a drought; 100 bushels may be reckoned on as a rule before curing Rs.700 would be a fair price to put per ton; the price may run high as Rs.750, but investors would not be likely to take hig prices in reckoning out profits. We thus get the followin figures:—

	Rs.
Working expenses @ Rs.100 per acre on 120 acres ...	12.000
Interest @ 7 per cent on working expenses allowing Rs.1,000 per mensem (roughly) ...	450
Total expenditure ...	12,450
Crop @ 3 cwts. per acre, 18 tons at Rs.700 per ton ...	12,600

The balance is only Rs.150, and out of this sum the interest the capital has to be paid. This certainly is not a very bright vi of the position, but it is no use blinking at the fact that co planting at the present prices is likely to spell ruin to all exc those who have large capital to back them.

Among the coffee planters of this Presidency, some are alrea being sold up, and others are trying hard to sell out before th crash comes. It is the small capitalists and superintendents wh will be most affected by the present state of things. Estates w now have to be worked in the cheapest possible way. The fo

ductions made will be in the pay of superintendents, which even w is none too good. The low prices before 1892 caused owners cut down the pay of their superintendents and managers, and hough after that coffee took a turn for the better, the superinndents and managers did not benefit by the rise in price When the old days a planter came to grief, he could as a rule get an pointment under the Government or in one of the Native States. ow most of these openings have been closed to them, as men are ought straight from Home to fill the same. Can any of your aders, whom this letter may interest, suggest any way out of the fficulty? Possibly in the near future we will see a lot of penniless anters searching for work. Good times may come again, but w the men who have brought and are still bringing "creepers" t will see the fatal results of overstocking the market with sistants, superintendents and small capitalists.

PUBLIC SALES OF COFFEE.

In matters most nearly related to its material welfare, the coffee de is, says the *Grocer*, in a fairly prosperous condition, as supplies e abundant even to excess, the assortment is wide and varied, and ces for medium or useful qualities are decidedly moderate. The lers have thus opportunities of satisfying all possible requirents for home consumption on much more advantageous terms than y had a twelvemonth ago and consumers at the same time have ced before them better qualities at lower prices than they have n able to reckon upon for several seasons past. Favourable as se circumstances undoubtedly are, however, to the development l success of the trade in general, they have nevertheless been ended by one very serious drawback, and that is a congestion of blic sales, which tends to throw everything out of gear, and eatens to bring business in landed parcels of coffee to a deadlock. nplaints, though for the moment suppressed, are not the less ent and strongly made against the defective arrangements, as y now exist, for disposing of coffee by auction; and the evils ulting from the prevailing system in occasioning delays, loss of e, and postponements of sales, have caused such wide-spread invenience to importers, exporters, and wholesale dealers that s admitted of all parties that "something should be done" to edy the existing state of affairs as speedily as may be, or a plete break-down must occur in the whole commercial machinery supplying the article to the public.

lready this year public sales of coffee in Mincing-lane have n postponed more frequently than ever, entirely because of the essive quantities put forward on certain specified days, and it always been uncertain when and at what hour such and such auction in a long series would commence and finish. The same l of chaos and confusion has been repeated during the present k, when, among the brokers' catalogues printed and issued for ee to be sold under the hammer, were included eleven that con ed particulars of parcels and descriptions which had been adised for public sale on the 12th instant, being nearly a fortnight r than the date originally fixed. At this rate of progress new season will be far advanced ere the superabundant imports offee from the British East Indies, Costa Rica, Guatemala, and r parts of Central America, will be worked off, and the nearer trade get at the wind-up of the supplies for 1899, the fewer will r chances be of securing precisely the kind of coffee they re to carry their supply over till another year. A healthy comtion has prevailed at the different auctions since the earlier of the season, which fact goes to prove that both dealers and pers were practically bare of stock at the outset; and as their ts have increased rather than otherwise, the extra buying essary to replenish the exhausted stores of bonded or duty-paid e has lent additional support to the import market. Though rates submitted to have been unquestionably low for the worst riptions of coffee, they have been reasonably cheap, if at times en, for the middling and intermediate grades; whilst for ht coloury, fancy, and attractive growths of plantation coffee, ad of a reduction, a tangible advance has in many cases been

arious remedies have been suggested for preventing one day's f public sales from blocking the way for the next batch, but no ement can be drawn up that will suit all parties and interests, and nothing definite has been decided upon. In the absence of any official meeting, only informal measures have been proposed to mitigate what some persons speak of as a "nuisance," and these have been very coldly received. It is known that mild attempts at reform would be useless, and so a few of the leading members of the coffee trade, with bolder spirits than their fellows, have hinted that Monday, which from ancient custom has been regarded as an "off" day, should in future be given up for the purpose of clearing away the arrears remaining from public auctions held in the preceding week. Some such arrangement would no doubt materially help to bring the average daily supply of coffee within a manageable compass, and greatly facilitate the sale, preparation, and distribution of the article throughout the country; but from what we have heard in influential quarters so drastic a course of proceeding on the part of brokers and their merchants would be strongly opposed by the wholesale dealers, who would resist to the utmost any encroachment on their Mondays, since that day, apart from all others, is the only one they can make sure of for valuing and revaluing the coffee, raw and roasted, conducting their correspondence, forwarding special samples to travellers, and interviewing their customers, who are usually on a visit to town. To interfere with this old routine of dealing in coffee at public sale or by private contract would be to disorganise the trade and open the door to complaints of another sort, which we forbear to touch upon while there is a probability of their not assuming a formidable shape. The grievances under which buyers and sellers equally labour must, therefore, we fear, remain unredressed, and their best motto will be to "Let well alone."

CEYLON TEA IN RUSSIA AND SWITZERLAND.

Mr. M. Rogivue has sent to the "Thirty Committee" the following letter, dated Moscow 1/13 May 1899:—

Dear Sir,—I duly received your favor of the 27th February for which I thank you, also your Committee for their kind allowance of £40 towards the cost of my advertisement-cards, in the form of Ceylon views, which I have distributed over Russia. I now beg to inform you that I have this day taken the liberty to draw these forty pounds sterling upon your goodselves at ten days' sight, to the order of Messrs. P. R. Buchanan & Co., London, which I shall thank you to kindly honour on presentation. As regards the progress of Ceylon tea in Russia, I am of opinion that the last newspaper advertisements directed by Mr. Christie, under my supervision, have done a great deal of good and the fact that more of Russian Firms' Tea buyers are establishing themselves in Colombo, and that the direct exports of tea from Colombo to Russia are increasing yearly in large proportions, also that the import of Ceylon tea in Russia, through London, and Germany is also increasing steadily,—is the best illustration one can get of the progress the article is making in this country, ——— is right enough when he says that Ceylon tea is largely used for blending with Chinese teas, but he is decidedly in error when he affirms that the Russians don't drink pure Ceylon tea. Almost all tea merchants in Russia are now selling pure tea in packets, and I am not afraid of venturing to say that a few millions of pounds are now likewise (pure) sold and consumed yearly in Russia. The bulk of the trade, it is true, being however for blending purposes, because the Russians do not care any more for the weak and tasteless China tea they are getting now. I was lately in Switzerland when I had the pleasure of meeting my old friend, Mr. Bremer of Messrs. George Steuart & Co., Colombo; he was greatly interested with the work I am doing there for the introduction of Ceylon tea in Switzerland: where (at Morges on the Lake of Geneva) I have opened an Agency of Rogivue & Co., Limited, for the sale in chests and packets of *pure* Ceylon tea, which is now gaining great favour in that country. Mr. Bremer will be able to inform your Committee about my exertions in pushing the article there, and he gave me to understand that the Thirty Committee would gladly support me and reimburse me a part of my expenditure for advertisement which I am doing on a pretty large scale by the way of newspaper publications, fine placards with Ceylon views, cards, pamphlets, and samples of pure Ceylon tea distributed *gratis* all over the country.

RUBBER CULTIVATION IN CEYLON.

E. S. G. writes to the *Ceylon Observer* :—

In reply to your enquiry as to the relative merits of Castilloa and Para Rubber cultivation in Ceylon, I think, and always have thought, that the former is adapted to a wider stretch of country than Para, and it will moreover grow and flourish at a much higher elevation; but the tree (in Ceylon at all events) is slow in developing, requires a good soil, and seed is very difficult to get: in fact unless a quantity can be imported into the country, it will be a long time before we have any appreciable acreage of this class of rubber growing here. I doubt, if there are more than 50 or 60 full-grown trees in the island at the present time, and it is only *some* of these that bear fruit. Those in the Peradeniya Gardens, for instance, though well matured, I am informed, give no seed. What Mr. Willis says about Para rubber growing in Ceylon may be briefly summarized thus:—

(1) That there is only a limited area available for its successful cultivation, probably about 10,000 acres in all; the land being situated between Kalutara and Ratnapura.

(2) If planted outside this zone, the trees, although they may grow well and develop a good girth, are not likely to yield a sufficient quantity of rubber to make the industry a remunerative one by itself.

(3) That the tree will do very much better in the Straits than in Ceylon, both as regards growth and productiveness.

As regards the area available for Para cultivation in Ceylon, I am inclined to agree with Mr. Willis that it is not very extensive if the *best* results are expected, and there is no doubt that well-grown trees in the locality he speaks of will produce very much better returns than in less favoured districts where the rainfall is deficient and the soil inferior. Experiments I have made fully bear this out: the yield from trees of varying ages in the Kalutara district being largely in excess of what would be expected in a drier climate. But when Mr. Willis implies that we must not look for a satisfactory yield *outside* this zone, I join issue with him at once and inquire how about Heneratgoda and the trees that have been tapped there?

Here we have a dry, hard, cabooky soil with a scanty rainfall,—conditions altogether unfavorable for such cultivation,—and yet the trees are well grown for their age and according to the published returns the tappings have been successful, both as regards the quantity and quality of the produce. The prospects of Para cultivation in Ceylon have been based exclusively on data supplied from Heneratgoda Gardens, and it says a good deal for the future of the enterprise that the returns should have been so satisfactory, seeing that according to Mr. Willis the trees are growing in a neighbourhood which may be described as wholly unsuited to their requirements. I have always myself thought it a great pity that the Heneratgoda Gardens were chosen as a home for the Para trees, for the reason that amidst such surroundings it seemed almost impossible that results could be otherwise than unsatisfactory. The published records of the yield, however, shew to the surprise of everybody, a very good margin for profit, even if the price of rubber were to fall considerably below present quotations; and in more favoured localities, there is every reason to be well satisfied with the prospects of the enterprise.

I agree with Mr. Willis that the tree might be planted with advantage through fields of tea, and I am of opinion also that if placed at wide distances apart, the shade would be beneficial rather than otherwise to the tea underneath, but the trees would have to be kept well lopped up.

The statement made by Mr. Willis that Para rubber can be grown to better advantage in the Straits than in Ceylon applies to many other products besides Rubber, and if we are to wait until we find something that will produce better results in Ceylon than anywhere else we shall have to wait for a very long time.

Take Rice, for instance. Is this cultivation to be discouraged because it grows better in India and Burma than it does here?

Are we to cease growing Cacao because the trees give better returns in the West Indies?

Is the cultivation of Tea to be discontinued because we cannot get the flavour of Darjeeling or the strength of Assam?

In Ceylon we have labour and transport facilities which counterbalance to a great extent the drawbacks associated with an inferior soil and, what we are chiefly concerned in knowing, is not whether tropical products can be cultivated to greater advantage in other countries, but whether there is a fair prospect of ma them remunerative here.

In the case of Para rubber the only figures that have as yet made public in Ceylon go to shew that satisfactory returns ca obtained from trees growing under all the disadvantages of soil climate, and such being the case the presumption is that very m better results may be expected when the trees that have planted in other parts of the country have reached full maturit

I have figures at my disposal which point to excellent from this cultivation; but in view of the fact that more exte tappings are now in progress it may be well to withhold t statistics in the meantime, though in due course the informa may be imparted to those interested in the cultivation of Rub in Ceylon.

The yield from Rubber trees in the Straits is considerabl excess of the best returns in Ceylon; but as a set-off against labour is twice as expensive there as it is here; and there are o disadvantages to contend with, though none that are very ser so far as I am aware.

THE CURING OF COFFEE.

A correspondent writes.—Coffee planters of South India ap to be exercising themselves a great deal recently in considering effect of the sun in the curing of coffee for the market. In loo over the proceedings of a recent meeting of the Nilgiri Plan Association, I observe that a discussion has taken place regar the appearance of East Indian coffee as compared with that other countries, particularly with that from Costa Rica. It stated that the former was dull and unattractive, while the la has a brightness which commends it to the notice of dealer. T was little information elicited as to the manner in which a provement was to be made, though it was generally acknowle there is much room for it and prominence was given to the that curers in this country are working on the old lines of 2 more years ago, while other countries have shot far ahead i appliances for preparing their produce for the market. What st one as remarkable in this age of progress, when so many artif methods are employed in developing almost every industry, is no machine has been devised to dry coffee artificially. It is known that tea should never be exposed to the action of the s the process of manufacture which imparts to the leaf a pec flavour and colour.

In this connection one might reasonably enquire why the heat is indispensable so far in the curing of coffee, and o naturally disposed to think that much the same effect mus produced in regard to it as happens in the case of tea. If artii heat were applied the natural flavour would be retained, as powerful heat of the sun has the effect of absorbing or evapor the essential original properties the article possesses. Take a mon case in practice here with petty cigar dealers. When o and mould enters their premises they have recourse frequent the expedient of drying their boxes of cigars in the sun, what result only practised smokers know. The cigar loses al original flavour, the action of the sun depriving it by absor or evaporation, of its original properties. As a matter of coffee planters know that coffee dried in dull weather is al superior to that dried under other conditions. On the other h tea-planters will tell you that the sun gives a thick liquor and dish colour to tea. It must, as a logical sequence, have a si effect on coffee. In the case of coffee, it is considered by best able to form an opinion that artificial heat would the colour of the leaf and prevent the pale, scorched appea that the sun gives it.

Manufacturers of green tea are only too well acquainted wi fact that a rich bloom is given to tea in the facing proces was at one time believed that the Chinese used "Prussian B produce this tint which could not be secured by any other of manipulation. Great objection was taken to this class o that account but it was left to Western intelligence to pro this unhealthy device was quite unnecessary. It was fu monstrated that stirring the dry tea in a hot pan for a produced the desired effect. The argument follows treated in the same way will give similar satisfactory

CENSUS OF INSECTS.

An insect census has just been taken on purely scientific lines with a view to determine, as far as it is possible, which insects are a boon and a blessing to mankind, and which are the reverse. Although the statistics quite upset the old idea, that all insects and lower animals were created solely for man's benefit, yet it is conclusively proved that while some insects are rightly termed "pests," there are others that render us considerable service and fortunately for our crops and vegetation the latter are in the majority. According to the census insects are to be classified as good, bad, and indifferent; the good insects number 116 families, the bad insects amount to 113 familes, while the indifferent insects, who could not for one reason or another satisfactorily answer all the questions on their census papers, and must, therefore, for the present be looked upon as doubtful characters, reach a total of families. No fewer than 112 families of the bad or injurious insects feed upon cultivated plants and crops, doing damage to, and devouring thousands of pounds worth of vegetable produce annually; gobbling up our spring cabbages and succulent young peas, etc., in the most ruthless fashion; while the 113th family is parasitic upon and cause much harm to warm-blooded animals. Of good or beneficial insects, seventy-nine families devote themselves to the destruction of their wicked vegetable-devouring brethren, which they accomplish in a most satisfactory and wholesale manner, while the remaining useful insects thirty-two families act as scavengers, clearing away with great rapidity all sorts of decaying vegetable and animal matter, two families aid us as pollenisers and three form food for our eatable fishes.

CEYLON ASSOCIATION IN LONDON.

The Report of the executive committee, 1898-1899, laid before the eleventh annual general meeting, on 12th June, says :—

There has been again, as in every previous year, an increase in the members on the roll, the present number being 163 as against 159 in 1898.

As foreshadowed in the last report, arrangements were made by the Committee for the full statement of the case for Ceylon before the Indian Currency Committee. Messrs. T. North Christie and H. Bois gave evidence in much detail as to the effect on Ceylon producing industries of the forced appreciation of the rupee, and have thereby earned the thanks of the Association. The Currency Committee has now finished its sittings for taking evidence, and its report is awaited with interest.

On 19th December last a General Meeting of the Association was held to consider the following resolutions:—1. "That this Association strongly disapproves of the proposed expenditure on the Ceylon Northern Railway, as being opposed to the true economies of the Colony." 2. "That a deputation be appointed to wait on the Right Honourable J. Chamberlain, M.P., with the view of urging on the Government a re-consideration of the Ceylon Northern Railway scheme, and that Lord Stanmore be asked to introduce the deputation." The immediate result of the meeting was to disclose strong Ceylon residents at home, many of them with very large interests in the Colony, a remarkable consensus of opinion adverse to the Government scheme, and the resolution of disapproval was passed *nem. con.* The deputation to the Secretary of State, it was decided, should be postponed till the views of the public bodies in Ceylon could be ascertained.

The position of this very important public question in Ceylon at the date of the Association meeting was, considering the novelty and gravity of the proposals, a singular one. It is true that early in the year both the Planters' Association and the Chamber of Commerce had passed resolutions approving of the then Government proposals; but those proposals embraced another Railway, and hence the value of the resolutions, as bearing on the Northern Railway, was rendered very uncertain.

Subsequently a change was made by the Government, both in respect of the gauge and of the provision of funds for the construction of the Northern line, a change on behalf of which no word of approval has been heard as yet from any quarter. The public bodies in Ceylon accepted the amended scheme without protest. Not so the local press; and in view of published statements as to the condition of opinion in Ceylon, statements which were left without contradiction, the Executive Officers of the Association felt it their duty to allow the question to be re-opened. Their action has been justified by the subsequent proceedings of the Ceylon public bodies.

It was most unfortunate that when for a second time the question came before the Planters' Association and Chamber of Commerce calm discussion on the merits of the Northern Railway should have been prejudiced by the introduction of personal and irrelevant matter, the more so as in the result the protest to the Secretary of State for the Colonies was thereby greatly weakened.

A deputation, representing the various interests of the Colony, waited on the Secretary of State on 16th March, and was informed that the Railway would be made, and made as a broad gauge line.

The Committee is unable to share the regret expressed by the Ceylon Chamber of Commerce and by the Chairman of the Planters' Association at the action of this Association; but, on the contrary, deems it a matter of congratulation that, at last, a formal protest has been lodged against the new Railway Policy of the Government.

The vote of thanks, accorded to Mr. J. Henniker Heaton, M. P., by the Association for his services in securing for Ceylon the benefit of Imperial Penny Postage, led to an invitation from that gentleman to representatives of the Association to attend a conference at the House of Commons to consider a scheme for the reduction of the cost of telegrams between the United Kingdom and the Colonies. The invitation was readily accepted, and it is hoped that the agitation thus initiated may prove successful.

The Committee regrets to report the death, during the year, of Mr. W. Bowden Smith, a gentleman who, for forty years, had been connected with the Ceylon planting industry, and during the year 1874–76 had represented that industry in the Legislative Council.

THE TEA AND PRODUCE COMMITTEE.

REPORT.

The Committee has held four meetings during the year.

The first subject brought under notice of the Committee was the proposal for the reduction or abolition of the duty on tea imported into the United Kingdom. A Joint Committee was appointed to consider the matter, consisting of three members of the Indian Tea Association (London) and three members of this Committee, Messrs. W. H. Anderson, H. Bois and H K. Rutherford. But in view of the opinion, expressed by the Committee of the Planters' Association of Ceylon, that it was not desirable at the present time to press for the proposed relief it was decided to postpone any action.

A correspondence took place with the Postmaster-General as to the rates of postage and the limits of weight for samples of tea posted between London and Ceylon, but no modification of the rules was obtained.

The Indian Tea Association (London) submitted to the Committee certain proposals for changing the conditions of public sales of tea. The chief of these was the reduction of the biddings at sales up to 6½d from ¼d to ⅛d., but the proposed alteration did not meet with the approval of the Committee. A new scale for deposits, payable on the purchases of tea at public sales, was approved by the Committee, but it has not yet been adopted in practice.

An attempt was made without success to obtain a reduction of the very high rates of freight ruling for tea and other produce between Colombo and the Australian ports.

In conjunction with the Indian Tea Association (London) a circular has been issued to all producers and importers of Tea, inviting assent to the proposed abolition of the allowance of 1 lb. draft on each package of tea sold at public sales. A large number of assents has already been received, and it is hoped that there may be sufficient support to enable the reform to be shortly carried into effect.

The great improvement in the statistical position of tea during the year, as giving hope of a more prosperous time in the near future, is matter for congratulation to all concerned.

HOW IT STRUCK AN AMERICAN.

[EXTRACT FROM A LETTER RECEIVED FROM GENERAL NAGLE BY MR. R. E. PINEO.]

"MY DEAR SIR,—I was quite delighted with your beautiful city, and with the evidences of prosperity which we saw on every hand.

"I have just read an article from your pen entitled 'Ceylon Tea in America.' Being an American, I was struck with the force of your suggestions concerning the most effective advertising of Ceylon tea in America.

"There is no question but that you people furnish a tea that is superior in quality and flavour to anything that comes to our shores, which, if properly advertised—its merits well demonstrated—would secure for it a very large sale indeed.

"Your Exhibit at the World's Fair in Chicago in '93 certainly must have augmented the demand for it very much, BUT A LIKE AMOUNT SPENT AS YOU SUGGEST WOULD BRING FAR GREATER RETURNS. The States are of very wide extent, filled with seventy millions of prosperous consumers. There is no way to make an impression on them in favour of Ceylon tea, but by hanging your banner on the outer wall and *keeping it there* CONTINUALLY. *The people who drink tea must see the banner*—not the jobber alone—and it will be of infinitely more advantage if they can be induced to sample the tea. In almost every case this will result in securing a new customer, which will swell the demand for the tea, and will furnish an incentive to the retailer and wholesaler alike to *push* Ceylon tea. *The advertisement in the local newspaper with the dealer's name attached will be worth far more than any general advertising you can do.*

"I have been a maker of American newspapers the greater part of my life, and feel that I know something of the subject in hand. I think I am safe in saying that, if Ceylon tea is properly put before the American people, you will have gained a permanent customer that will make the beautiful island of Ceylon, with its enterprising and interesting people, wealthy beyond expectation."—*Ceylon Observer.*

ATTAR OF ROSES.

The *Chemist & Druggist* says :—

A well-informed correspondent in Bulgaria writes to us under date, May 19, as follows :—"The distillation of the new rose crop has just begun. Compared with previous crops this year's rose-harvest is at least ten days earlier. This is due to the hot and dry weather which has prevailed throughout the entire country since the beginning of May. Should this hot and dry weather continue for the rest of month the rose-harvest, instead of lasting three or four weeks, may last only two weeks, and the yield may be just about the same as last year's. If, on the contrary, cooler weather sets in and we have one or two rainfalls, the present crop is bound to be considerably larger. Everywhere the yield of rosebuds is abundant, and the one thing just at present wanted is cooler weather to keep back the rapid opening of the roses and to enable the growers to duly gather and distil the flowers."

It having been stated that certain Bulgarian rose-growers have recognised the value of guaiacum-wood oil (so-called champaca-wood oil) as an adulterant of otto of rose, Mr. E. J. Parry, B. S., F. J C., writes:—I have not been able to find much information in regard to this oil, but have recently examined eight samples from different packages of a consignment of otto of rose, of which seven gave results which agree closely with what is known of it. The congealing-points were in all cases within the usual limits of normal rose oil—from 19° to 22°—and the optical rotation was quite normal. The sp. gr f., however, varied from 0·8·0 to 0895. The stearoptene is of a beautifully crystalline character, not closely resembling that of pure rose oil in appearance; it melts at 33°—34°, but gives an acetyl number, indicating the presence of a solid alcohol. I had not sufficient of the oil to examine the stearoptene of each in this way, but it is probable that each contained this solid alcoholic constituent, and provided one can separate about 2 grammes of stearoptene the presence of this body, which is indicative of the presence of guaiacum-wood oil, may be detected with certainty.

THE FERTILISATION OF PLANTS.

M. Guignard presented to the Academy of Science on April 4 paper on "The Processes of Fertilisation as observed in Lili Martagon." The paper is very technical, and can only be follo in its entirety by specialists. In the pollen-tube, as is now kn known, are formed two cells, one vegetative, one reproductiv In the embryo-sac also are various nuclei, one of which is call the polar nucleus, as well as groups of cells at either end. As as the pollen-tube penetrates the embryo-sac, one of the two ma nuclei unites with the polar nucleus, the other with the oosphe or egg-cell. The male nuclei elongate into the form of a hook crescent, ultimately becoming spirally twisted. Although no ci are visible, M. Guignard does not hesitate to call this an "anth rozoid" from the close analogy there is between this and the ma reproductive bodies of the higher cryptogamous plants and some gymnosperms (Ginkgo, Cycas). In summing up M Gu nard says that the essential phenomenon observed by M. Nawa chin and himself, consists in a two-fold sexual union in the embry sac, the one resulting in the formation of the embryo, the oth developing into the albumen or perisperm in which is stored up t food required by the embryo. If these results be confirmed, t gap between the vascular cryptogams and the flowering plants again bridged over. The albumen, as well as the embryo, th seems to be the result of a sexual process, which is quite a no idea. The variations in the number of the chromosomes, sugge to us a possible explanation of the phenomena of "sporting" a of variation generally. It seems that the life-history of the flowe ing plants and all that it implies, must be studied in the dev lopment of the embryo-sac and its contents. These research must therefore be made by the few, for not many can be endow with the necessary skill or material requirements.

THE DETERIORATION OF COFFEE.

Apropos of the deterioration of East India coffee, w may call our readers' attention to remarks of the *America Grocer* based on the following inquiry from a Colora correspondent :—"Will you please inform me why coffee w get now is so inferior to that of 1860? Especially is th true of old Government Java. We now pay nearly thre times the price and the quality has deteriorated one-hal Other grades have suffered in like manner, but not to su an extent. Are the best products shipped to other marke or the berry picked too green, or the want of age?"

Our contemporary remarks :—It is conceded by experts that t average quality of coffee at the present time is not equal to that former years. This is probably due to the excessive producti particularly in Brazil. It is the experience of dealers that whe large crop is to be marketed, planters do not take that care its preparation which they do when the crop is small. While th is true, it is also true that it is still possible to get as fine or fi coffee as was ever imported into the United States. But the p portion of old Government Java coffee of high grade to the to supply is less than one per cent. Brazil now furnishes nearly 80 p cent. of the total supply of coffee. A large proportion of San coffee, which is mild in flavor, is used as a substitute for E India sorts, as are many of the varieties grown in Central Amer Venezuela, and the United States of Colombia.

While you can procure as fine a coffee as in former years, it somewhat more difficult, as now-a-days the great bulk of the co sold at retail is roasted before it reaches the retailer, and therefo he is not as sure that the coffee is as true to name as when bought his coffee in the raw bean and had it roasted as wa This latter policy is the invariable rule with all high-class g particularly in the largest cities, and notably in the Eastern a Middle States.

Undoubtedly the methods of preparation on the plantations superior to what they were forty years ago, but the coffee is

d to market in steamers instead of coming by sailing vessels, and thus loses the mellowing influence of time. We must also cognize that the production of coffee, while extended in Central d South America, has declined in the East Indies and Ceylon, ere the production is not over one-third to one-half of what it as-twenty years ago. The result is that there is such a demand the fine coffee of Sumatra and Java that the price is nearly ee times what it was in former years.

At the present time there is a range in the value of raw coffee of m 6 to 32 cents per pound, and it is stated that some very fancy azil Mandheling, which is very scarce, would command 2 to 3 nts per pound more.

Age is of benefit to green coffee, and hence our leading retailers re Java coffee for a long time, in order to be certain of getting e quality and keeping their standard high and uniform. The mber of dealers doing this, however, is comparatively small, cause probably 95 per cent. buy their coffee roasted, and they never ow whether it is true to name or not, as the identity of the bean appears in the roaster, at least so far as it relates to the place growth The writer has used coffee for thirty-four years, and drinking as fine coffee to-day as he ever used, but it costs a high ce and is only obtainable from the most reliable firms in the siness. "The man at i'o'keepsie," to whom "Coffee, from Plant-on to Cup," by Francis B. Thurber, was dedicated, is serving rons with as fine a cup of coffee as he was thirty years ago.

In order to test the above expression of opinion, we sought out . William Merrall, of Acker, Merrall & Condit, for fifty-four years ealer in fine coffee, who said: "I have always taken a great erest in coffee, as is indicated by the bill which you see hang-by my desk, bearing date Albany, April 5, 1830, made by R. Morris, and calling for fifty pounds of Java coffee at 15 cents pound. To-day I am figuring for a fine old Mandheling at 35 nts per pound. We have just as good coffee to-day as in 1860, the secret of it is that we maintain our high standard by rchasing the finest mat coffee, and having such as come by sail-vessels instead of steamers, and then storing them for a long e, as age improves flavor or ripens the bean, bringing out the ightful aroma. I imagine your Colorado correspondent has d in the East and is disappointed that he cannot find in the st the same sort of coffee he used to get here. Of course, the mand for fine Java coffee is so out of relation to the supply that price is high, and dealers generally sell other sorts as Java, this firm has always maintained its high standard for half a tury."

TEA CONSUMPTION IN PERSIA.

Messrs. W. S. Cresswell & Co., circulate the following correspondence regarding the consumption of tea in Persia:—

British Legation,
Teheran, May 6th, 1899.

Messrs. W. S Cresswell & Co.,
10, Hare Street,
Calcutta.

IRS,—In my letter of February 18th last I informed you that I ld make enquiries regarding the sale and consumption of tea Persia at the various trade centres, and would communicate to the results of my enquiries. I have since ascertained that you e addressed Her Majesty's Consular Officers in Persia directly he subject, and that reports with samples of tea have already n supplied to you from Meshed, Ispahan and Bushire. I smit to you herewith a report which has reached me from Her sty's Consul-General at Tabriz on the tea trade of his district, I further enclose such particulars as I have been able to obtain rding the tea trade of Teheran, together with samples of the cipal varieties of teas sold.

sting that this information may prove of use. I remain, Sirs, obedient servant—H. M DURAND.

Her Majesty's Consulate-General, Tabriz, 16th March, 1899.

His Excellency Sir Mortimer Durand, K. C. S. I., K. C. I. E., etc., H. M. Envoy Extraordinary and Minister Plenipotentiary, ran.

SIR,—In reply to Your Excellency's Circular of the 10th February transmitting the copy of a letter from Messrs. Cresswell & Co., of Calcutta, desiring information with regard to the consumption of tea and the prospects of the trade in Persia, I have the honour to submit the following information on this subject which I have been able to gather:—

The amount of Indian tea imported from Calcutta and other parts of our Indian possessions, *viâ* Trebizonde, is some 20,000 chests, weighing from 80 to 100 lbs. each, upon each of which the charges, between India and Trebizonde, are from Rs.7½ to Rs.8.

This quantity is not totally absorbed in this province, part of it being distributed to Teheran and other places.

Tea drinking is the only solace and relaxation of the Persian native, and the leaf is to be found in every corner of the land.

Its use can only augment as the population increases, for it is used in preference to water. The decoction is, however, always taken hot and weak, and the addition of water to the first brew brings the comforting draught within the means of the lowest purse.

These teas are distinguished in Persia by the following names and prices, the pound sterling being at 52 krans.

"Shahi"—(of mediocre quality) price per lb. krans 3½.

"Galami"—(pen-like) so called owing to its being a thicker and long leaf, ordinary quality 3 to 3¼ krans per lb.

"Agh Par"—(white leaves) owing to white or greyish leavel being found in it, considered best quality, 4 to 5 krans per lb.

Natives alone are importers of these teas, and they pay 5 per cent. duty to the Customs, but are subjected to fees and dues exacted by Custom, etc., amounting to another 5 per cent.

Indian teas are transported in bulk in zinc or lead paper lined cases of the weights already mentioned (80 to 100 lbs.)

Some 383 cases, containing about 200 packets of 1 lb. of Russian (caravan) tea, are imported over the border, but is only used now and again by the wealthiest classes, for it is mostly high priced.

Carefully selected and docketed samples of the Indian and Russian teas used in these parts accompany this report.

I have, &c., (Sd.) CECIL G. WOOD.

TEHERAN TEA TRADE.

General.—All the tea consumed in Teheran appears to be imported, directly or indirectly, from India or Ceylon None is imported from China. Import, say, 600 cases monthly. The trade is almost entirely in the hands of Persian merchants, but Parsis import five to six hundred cases yearly. The trade is said to be increasing. The duty (octroi) is ten shahis per case The credit system of purchase prevails, as far as the wholesale trade is concerned.

"Kalameh."—The variety most commonly consumed is called "Kalameh," about 400 cases monthly being imported. Each case contains about 15 maunds (say 100 lbs.). There are three qualities of this tea, and the wholesale prices average 15 to 17 krans a maund, though higher rates rule occasionally. Imported *viâ* Persian Gulf.

"Sefid Kerpek."—Tea is also imported *viâ* the Persian Gulf, to the extent of about 80 cases monthly. There are two qualities. The better is packed in green wooden boxes and fetches about krans 50 per maund. The second quality is packed in tin boxes, and averages about krans 25 per maund.

"Pashmeik Sefid."—About ten cases of this quality are consumed monthly, and present price is about krans 34 per maund. Import is *viâ* the Persian Gulf.

"Tabriz" tea is of two qualities. It reaches Teheran *viâ* Trebizonde and Tabriz, packed in ten-maund cases. The best quality fetches krans 30, and the second krans 22 a maund as an average.

"Russian" tea, so-called, is imported to the extent of 50 cases monthly. It originally comes from India, but passes *en route* to Persia through the Moscow district, where it is adulterated to suit the taste of a section of the Persian tea drinkers. This tea is packed in "Gervonkehs" of 80 miscals each, to case containing 260 gervonkehs (100 miscals equal about 1 lb.). Prices about krans 3 per gervonkeh. About ten cases monthly are imported containing pictured tins of this tea, which realise about krans 5 each.

DISTRICT ASSOCIATIONS.

WYNAAD.

Proceedings of a Committee Meeting of the Wynaad Planters' Association held at Meppadi, on 7th June 1899. PRESENT:—Messrs. J. W. Hockin (Chairman), C. E. Abbott, D. Mackenzie, J. R. Malcolm, S. Robinson and E. de Fonblanque, Honorary Secretary.

Roads.

Resolved,—That Mr. W. B. deWinton, Chief Engineer, P. W. D., be addressed on the subject of the large deduction made from the Government Grant towards the up-keep of the Calicut-Choladi road by the amount diverted for the maintenance of *The Chundale*—Sultan's Battery road.

Read letter from Mr. R. K. Walker resigning his seat on the Committee and on the District Board, Calicut, owing to his leaving for England.

Resolved,—That Mr. M. Douglas Taylor be requested to act on the Committee in Mr. Walker's place.

Pudu Padi Hotel.

Resolved,—That C. Shangran's pay be stopped until the stables and bungalow be put in order.

Next General Meeting.

Resolved,—That the next General Meeting be held at the Jubilee Hall, Vayitri, at 2 p.m., on 2nd August.

E. DE FONBLANQUE,
Honorary Secretary, W. P. A.

COORG.

Proceedings of the Annual General Meeting of the Coorg Planters' Association, held at the North Coorg Club, June 1st, 1899. PRESENT:—Messrs. R. Selby Branson, H. F. Davy, T. L. Hext, J. W. Irwin, C. G. Maclean, W. G. Mackilligin, J. S. Morgan, A. W. Ogilvie, A. E. Wright, and W. H. Sprott, Acting Honorary Secretary.

The accounts for the year were submitted and showed an expenditure of Rs.1,349-13-6 and a balance of Rs.410-1-3, of which nearly the whole are outstandings. The acting Honorary Secretary then read the Annual Report.

Annual Report, May 31st 1899.

GENTLEMEN,—Owing to the retirement of Mr. Parsons from the Secretaryship on his leaving for England, I have carried on the work of the Association for the last six weeks, until a new Secretary could be appointed at this Meeting; and, in presenting to you this report, on behalf of the Committee, hope you will remember that I have only been acting as Secretary for a very short time. I am sure you will agree with me that the hearty thanks of the Association are due to Mr. H. G. Parsons for the very efficient way in which he has carried on the work of the Association and regret his retirement from the post of Secretary, which he has so ably filled for the last five years.

Crop.—The coffee crop just gathered was one of the best the country has given for some years; but, unfortunately, the poor quality of the coffee, owing to the season, and the great drop in prices, owing to the large Central American and Brazil productions, has deprived us, to a great extent, of the benefit of the good crop. The price of native coffee was also extremely low, and large areas have been abandoned by the natives and have gone out of cultivation. The official returns of the coffee crop for 1897-98 were 2,500 tons against 2,030 tons for 1896-97, and this year, in spite of the decrease of native, coffee should show a substantial increase. Next year the prospects are almost universally poor, and a great deal of damage is reported to have been done by abnormally heavy rain in April. However, we can only hope for better quality and better prices. Mr. Cameron, whose services were so kindly lent by the Mysore Durbar, made a tour of these coffee districts during November, and delivered two very interesting and instructive lectures at Mercara and Pollibetta, a report of which has been printed and circulated, and has also been sent to the U. P. A. S. I., and will doubtless form a subject for discussion at the next Meeting. Our best thanks are due to Mr. Cameron for the trou[ble] took, and for his very able and instructive lectures, and to Mysore Durbar for lending his services.

Tea.—About 50 acres have been planted by Mr. Parsons du[ring] the year, but, owing to small plants being put out, the clearing not so successful as it might have been. This industry is b[eing] watched with great interest.

Cinchona.—Owing to the rise in the price of this product, increa[sed] interest has been given to the hitherto-neglected cinchona t[rees] and several lots of bark have been sent home for sale.

U. P. A. S. I.—One of the most important matters brought before the Meeting in August 1898 was the currency question, a[nd] the policy of Mr. Acworth. Your delegates, acting under [in]wishes there, disapproved of it and were supported by South M[alabar].

There now seems little doubt that the Currency Committee w[ill] recommend a 1*s.* 4*d.* rupee, and the adoption of a gold coinage be gradually introduced into the country. This as yet has tended to ease the scarcity of money, and, until some final deci[sion] of this great question is arrived at by the Government of In[dia] money is likely to continue scarce, as no one knows whether mon[ey] brought out from England may not have to be returned at a los[s].

You will doubtless have read, in the U. P. A. S. I. Report, [a] very interesting discussion on hybridisation, which still seems promise to help us in our industry. Mr. Cameron, when he seemed to think very highly of it, and is carrying out a series experiments in Bangalore, and wrote, a short time ago, saying t[hat] he thought he had been successful in cross fertilising several spec[ies] of coffee.

The subject of an agricultural chemist was also brought up, a[nd] your delegates urged the Chief Commissioner to support us, and and get the Government to give a grant, so that Coorg should a[lso] have the benefit of the chemist whom the Mysore Durbar h[as] brought out. Unfortunately, in spite of the Chief Commissioner's support, the Government of India did not see its way to help us the matter, so that we have lost the opportunity of getting benefit of his services at a small cost, which the wise and far-see[ing] policy of the Mysore Durbar has now started for the benefit of Mysore State.

Committee of Enquiry.—The Government of India have ackn[ow]ledged that we have gained our case, and the matter has been f[or]warded to the Government of Madras to frame a Draft Act. T[his] has not been forwarded to us, though we have had certain hi[nts] of the Draft Act indicated to us, and are unanimously of opin[ion] that a deterrent fine should be imposed on all contracts rescind without notice, and that six months' notice should be given of a wi[sh] to terminate an agreement.

Roads and Communications.—These have been fairly well ke[pt] up during the year. A portion of the work on the Wynaad-Pona[ni]pett Road has been done, and it is to be hoped will be complet[ed] this year. Rs.5,000 has been granted to make a start on t[he] Hutti and Madapur Bridges, and it is satisfactory to note th[at] Government has at last listened to the representations of [the] Association, after so many years, in this important matter.

Police & Revenue.—The paragraph No. 4 in the notes by the Ch[ief] Commissioner of Coorg on the report on the administration [of] Coorg for the year 1897-98 speaks for itself, and I cannot do bett[er] than quote it, as it expresses what we have been urging on Gover[n]ment for many years.

"The administration of Coorg in this important departm[ent] must, I am afraid, be described as being in a very backward con[di]tion.

"The revenue management is only just emerging from darkn[ess] and chaos. The subordinate officials are distinctly inferior to th[ose] on whom District Officers necessarily depend for assistance revenue work in other parts of India, and the field for selection at present unfortunately limited. The Police force is underp[aid] and is, in consequence, unable to attract suitable recruits [and] besides, insufficient European control. The arrangement, un[der] which the District Magistrate combines executive police duti[es] with his magisterial work, is both theoretically unsound and pr[ac]tically disadvantageous. A high standard of work cannot, in these circumstances, be expected. The conclusion I draw fr[om] close study of the administration of Coorg is that the maintena[nce] of anything approaching the thoroughness and efficiency to be fo[und] in other Provinces in the Revenue and Police Departments impracticable of attainment so long as the existing defe[cts] allowed to continue. I hope shortly to be able to submit a sch[eme]

partial reorganization for the consideration of the Government India."

Plague.—Fortunately we have escaped the plague so far, though has broken out in the Mysore State, not far from our frontiers. l possible precautions have been taken to prevent its coming to the country, and plague rules issued. So we can only hope at it will be shortly stamped out. Luckily our officials are fully are of the difficulties of enforcing stringent plague measures, ing to the enormous loss that would be entailed on us all, if our our and food-supplies were stopped coming in.

In the event of disease appearing on the coffee estates, it will t with ourselves, in a very great measure, to stamp it out, as roughly as possible, and it is to be hoped that every planter, for own sake, will use every endeavour to do so.

General.—Coffee assessment for the year 1897-98 showed a decrease Rs.1,374-15-1, and, owing to large areas being abandoned by tives, it is probable that there will be a still further decrease s year. The total revenue of Coorg for 1897-98 is the lowest since 00-91, showing a decrease of Rs.25,500, but, owing to reduced enditure on D. P. W., the net surplus, Rs.2,65,700, is higher than the year 1896-97 by some Rs.19,000. This is hardly a satisfactory te of affairs for us who are so dependent on good roads and mmunications, and we are glad to hear that a larger grant has n sanctioned to the D. P. W. this year.

Labour has been abundant during the year. For some reason the ality of the coffee has generally been much below the usual ndard, which has seriously affected our prices, which are the est we have had since 1884.

I should like to point out to members that it very much in- ases the difficulties of the Secretary, if he is without funds, and to be continually sending out reminders that subscriptions are e.

There are 73 members from last year, of whom one, Mr. B. engappa, has died: five new members have joined and three more m June 1st, and one Honorary Member.

Your Committee, President and Honorary Secretary now der their resignation, and ask you to open the balloting papers.

Proposed by Mr. Mackilligin and seconded by Mr. Morgan, that report and accounts be passed.—*Carried.*

Balloting papers for the President, Secretary and Committee wed as the result that Mr. W. H. Sprott was elected President, A. Lambert was elected Secretary, and the following as mbers of the Committee:—

North Coorg.	*South Coorg.*
Mr. W. M. Ball.	Mr. J. Logan.
„ C. E. Murray-Aynsley.	„ J. S. Gerard.
„ E. A. Fennell.	„ H. Grant.
„ G. R. Pearse.	„ W. Davies.
„ J. T. Morgan.	„ W. G. Mackilligin.
„ H. F. Davy.	„ E. M. Breithaupt.
	„ H. G. Parsons.

he papers with reference to the Paris Exhibition of 1900 were l and the practicability of a joint coffee shop was discussed. advisability of going in for the latter and subscribing funds gone into.

roposed by Mr. Maclean and seconded by Mr. Mackilligin, the matter be left in the hands of the delegates at the P. A. S. I. Meeting, who should use their discretion on hearing t the other Associations propose to do—*carried.*

roposed by Mr. Sprott and seconded by Mr. Wright, that the ernment be written to, asking them that the notices of all land e put up for sale for arrears of assessment be sent to the ounding proprietors and owners, and also that they be published he Gazette, as well as affixed to the premises mentioned in e 97 of the new Coorg Land Revenue Regulations—*carried.*

roposed by Mr. J. Irwin, seconded by Mr. Sprott, that the Govern- t be asked to publish a detailed map of Coorg, as soon as ible, now that the survey has been completed—*carried.*

roposed by Mr. Sprott, seconded by Mr. Mackilligin, that T. Macpherson be elected a member of the Association—*carried.*

he Meeting then closed with a vote of thanks to the President Secretary.

he following papers were laid on the table:—

1. *North Mysore Planters' Association.*—Proceedings of Annual eral Meeting held at the Club, Balehanour, March 22nd, 1899.
2. *Nilgiri Planters' Association.*—Proceedings of Annual General Meeting held at the Masonic Hall, Ootacamund, May 10th, 1899.
3. *South Mysore Planters' Association.*—Proceedings of Annual General Meeting held at the Munzerabad Club, Saklaspur, April 30th, 1899.
4. *Central Travancore Planters' Association.*—Proceedings of Quarterly General Meeting held at the Carrady Goody Bungalow, April 8th, 1899.
5. *Shevaroy Planters' Association.*—Proceedings of Committee Meeting held at the Victoria Rooms, May 1st, 1899.
6. Draft of Coorg Land and Revenue Regulations, 1899.
7. Report of Mr. Cameron's visit to Coorg.
8. Report on Administration of Coorg, 1897-98.
9. Report on operations of the Department of Land Records and Agriculture, Madras Presidency, 1897-98.

W. H. SPROTT,
Acting Honorary Secretary.

TWO OF A TRADE.

That two of a trade seldom agree is a common saying. Its weakness, however, resides in the fact that it is a cavilling, sneering saying. The idea sought to be conveyed is that the disagreement is the outcome of reciprocal jealousy. While that is likely, it is not a necessary, or even a philosophical, inference. Two of a trade may easily see reasons for an honest difference of opinion to which the outsider is blind. Again, two of a trade may agree and both be wrong—on a point, of course, connected with their own industry. Some years ago there was high debate over the question whether a painting, exhibited in Paris, was an original Velasquez or a copy. Half the artists and *connoisseurs* in Europe got hot under the collar about it. It was one or the other—so they said. Later on the fact came out. It was neither an original nor a copy; it was a *replica*. The experts were mistaken. And so runs speculative judgment in everything.

Here is the case of two doctors; both, doubtless, competent men. If they were wrong, or if only one was wrong, - but let us have the story first. It comes from a reputable source, and is well corroborated.

"In March, 1891," says the relater, "I had a severe attack of influenza, which prostrated me for two months. After this I could not get up my strength. My appetite was poor, and what little I did eat gave me much pain at the chest and around the heart. Sharp, cutting pains in the region of the heart seized me every now and again, sometimes so bad I feared I was going to die. At night I got little or no sleep on account of wind, which rose into my throat until I fairly gasped for breath. During the painful attacks of my complaint perspiration would stand in beads upon my face.

"I soon lost strength to that extent, I could not stand. Indeed, I was weak as a child. I was often so dizzy I had to catch hold of something to keep me from falling. Several times these attacks have come upon me at concerts, obliging my friends to conduct me home. As time passed on I grew more and more feeble and abandoned all hope of ever being well and strong again.

"I had two doctors attending me who prescribed medicines; which, however, eased me only for a time and then I was as bad as ever.

"*One doctor said I had pleurisy; the other said I had heart disease.*

"For two and one-half years I lingered along, nearly as much dead as alive, all my relatives and friends thinking I would not recover. In November 1893, a book was left at my house in which I read of a case like mine having been cured by Mother Seigel's Syrup. My wife procured me a bottle from the Provincial Drug Stores in Westgate Street, and the first bottle gave me so much relief that I continued with the medicine. I could then eat well and the food agreed with me; the pain around the heart soon ceasing.

"In a short time my strength returned and I got back to my work well and vigorous. Since then I have been *in the best of health.* You are at liberty to publish this statement and refer to me."—(Signed) William Henry Jervis, 48, Rendlesham Road, All Saints, Ipswich, November 13th, 1897.

One of Mr. Jervis' doctors pronounced his complaint to be pleurisy; the other said it was heart disease. Were they both right, or both wrong? Or was one right, and the other wrong?

In the latter case—which one? Judging from the symptoms as set forth by Mr. Jervis the probability is that both were right—*as far as they went.*

The sac or bag which surrounds the heart (called the pericardium) and the sac in which the lungs rest (called the pleuræ), are parts of the lymphatic system; which is the especial abiding place and stamping ground of the kind of poison, produced by the diseased digestive system, and the cause of rheumatism, gout, pleurisy, and heart disease. Now, after (if not before) his attack of influenza Mr. Jervis suffered from acute dyspepsia with torpid liver, which engendered the poison that set up a mild form of both pleurisy and heart disorder When the real and underlying ailment of all—the *dyspepsia*—was cured by Mother Seigel's Syrup these supplementary or consequential troubles vanished, as might be expected

So we see that—strange as it may seem—two of a trade can differ and both be right.

MARKET REPORT.

By Mail advices of 2nd June 1899.

COFFEE.

The *London Commercial Record* says:—The auctions this week have consisted mainly of Costa Rica and other Central American descriptions, the demand for which has been slow and values irregular. Colory qualities have sold at steady prices, but the lower grades have been flat, and only partly sold at a decline of 1s to 2s per cwt. East India attracting little competition the bulk was withdrawn from the auctions, the small proportion which was sold being again rather cheaper. The market for "futures" has been flat at declining prices.

Brazil "futures" close as follows:—

London	Santos	July delivery	28s.
New York	No. 7 Rio	„ „	4.85 cents.
Hamburg	Santos	„ „	28½ pf.
Havre	Santos	„ „	34¼ francs.
Holland	Good ordinary Java		27¾ cents.

Imports, Deliveries and Stock of Coffee in London are as follows:—

	Stock.		Imports.	
	1899.	1898.	1899.	1898.
Tons	23,301	15,941	25,624	23,618
	Home Consumption.		Export.	
	1899.	1898.	1899.	1898.
Tons	7,090	6,465	9,671	10,856

The preceding figures exhibit—

In the Imports an increase this year of 2,006 tons.
Home Consumption an increase of 625 „
Export a decrease of 1,185 „
Stock an increase of 7,360 „

Ceylon.—13 casks 5 tierces and barrels nearly all sold—small low brownish 41s. low medium 64s 6d to 80s 6d, extra bold 113s, pea-berry 60s to 73s.

East India.—1,653 bags offered and partly sold—*Mysore*, small low dull greenish foxey to fair dull greenish 33s 6d to 42s 6d, small blue 45s, low middling 60s, bold 75s, pea-berry 75s; *Pulneys*, pea-berry 74s; *Nelliampathy*, small 38s, low middling 47s 6d to 49s, bold 72s 6d to 73s, pea-berry 73s to 74s; *Neilgherry*, small dull greenish 33s, low middling 45s, bold 62s; *Peermade*, small fair greenish 38s 6d, low middling 46s.

Costa Rica.—4,650 bags nearly all sold, viz., small low greenish to fair colory mixed 32s to 39s, good ordinary to fine ordinary greenish 36s 6d to 43s 6d, fine fine ordinary pale greenish to low middling colory 46s to 6d to 54s middling to good middling blue 58s 6d to 69s 6d, fine middling 75s to 79s 6d, bold good to fine 80s to 90s 6d, pea-berry 53s to 81s.

Colombian.—1,015 bags partly sold—small low mixed to fair colory 26s 6d to 38s, low middling greenish to middling colory 46s 6d to 54s, good middling colory 56s to 61s 6d, bold good blue 70s to 70s 6d, pea-berry 52s to 60s 6d.

Guatemala.—2,111 bags offered and a fair quantity sold, small common mixed grayish to good colory 31s to 42s, fine ordinary grayish to fine fine ordinary brownish and greenish 41s 6d to 45s, middling grayish to colory 51s 6d to 56s, good middling colory to 60s, bold good colory 70s to 80s, pea-berry 54s to 85s.

Salvador.—1,085 bags offered only a small portion sold good fine ordinary grayish 38s to 43s, pea-berry 47s.

Mexican.—792 bags offered about half sold, small fair colory 6d, middling blue 52s to 52s 6d. pea-berry 75s.

TEA.

China.—At the auctions on the 31st ult., 3,311 packages offered,

On the 1st inst. 1,212 packages of Moyune and 148 boxes Suey were offered, which met with a quiet demand, and prices generally easier. Moyune, Gunpowder sold at 4½d to 10½d.

rial 3⅛d to 4⅛d, Foong Mee 8¼d to 10¾d, Sow Mee 6¼d to 1s 1d; oung Hyson 3⅞d to 7d; Hyson 3d; Ping Suey, Gunpowder 6d

INDIAN.—Public auctions were resumed on Monday, the 29th ult., hen 7,000 packages (including 281 packages of the new crop) were rought forward. There was a fair enquiry for old seasons, es-ecially for parcels with tip which may be quoted a little dearer, ut for others there was no material alteration. The New Teas hich were of ordinary type were not very briskly competed for, and ost of them were withdrawn. Catalogues contained a good lection from Southern India, comprising 1,500 packages, the ajority being of useful description, and former rates were well aintained.

The quantity printed on Importers' Account in the month was:—

1899.	1898.	1897
39,600 pkgs. (281 new season's) (Including Whitsuntide).	83,000 pkgs.	64,700 pkgs. (255 new season's) (Including Whitsuntide).

London Bonded Warehouse statistics for May were:—

	IMPORTS.	DELIVERIES.	STOCK, 31st May.
1899 ...	700,000 lbs.	9,966,000 lbs.	31,502,000 lbs.
1898 ...	427,000 „	11,671,000 „	38,213,000 „
1897 ...	494,000 „	11,232,000 „	32,235,000 „

CEYLON.—Considering that no public sales had been held since e 16th ult., the quantity offered on Tuesday was moderate, viz., ,000 packages.

Demand was principally for price. Common Pekoe Souchongs ere eagerly taken at 7d per lb, whereas decidedly better ones and koes only fetched 7¼d to 7½d per lb. Many Orange Pekoes also alised 7½d per lb., so that the range was much contracted. Low ss broken Pekoes in most cases were a little easier, selling down 7½d per lb., while in the grades above very good value was still be had under 9d per lb. Fine and finest were in short supply d occasionally commanded more attention.

The average is the same as on the 18th ulto. when it stood at 8d r lb., at this time a year ago it was 7¾d per lb.

Totals sold during the months were:—

1899.	1898.	1897.
97,600 pkgs. (Avge. 8⅛d per lb.)	92,300 pkgs. (Avge. 7¾d per lb.)	116,200 pkgs. (Avge. 7½d per lb.)

May figures are as follows:—

	IMPORTS.	DELIVERIES.	STOCK, 31st May.
1899 ...	9,327,000 lbs.	7,190,000 lbs.	19,790,000 lbs.
1898 ...	6,507,000 „	8,038,000 „	17,231,000 „
1897 ...	8,142,000 „	8,920,000 „	19,953,000 „

JAVA.—Only 144 packages of direct import were submitted which nt off steadily.

The undermentioned parcels passed the hammer in May:—

1899.	1898.	1897.
1,500 pkgs. (Avge. 7⅞d per lb.)	3,800 pkgs. (Avge. 6½d per lb.)	4,500 pkgs. (Avge. 5¾d per lb.)

Deliveries.—The clearances of all Tea (on which duty has been d) from the London warehouses, as per official returns, were:—

From 1st to 30th May, 1899	13,927,315 lbs.
„ „ 1898	16,485,323 „

During the fortnight the following have been printed for sale by blic auction:—

	Sold.	Withdrawn	Total offered.
	Pkgs.	Pkgs.	Pkgs.
India	5,690	1,252	6,942
Ceylon	23,560	1,478	25,038
Java	91	53	144
Total ...	29,341	2,783	32,124

Also 143 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, 2nd June 2nd, 1899, states.—

QUANTITY BROUGHT TO AUCTION IN LONDON
FROM 1ST JUNE TO DATE.

	Indian	Ceylon.	Java.
1898-1899 ...	1,561,559 pkgs.	1,115,863 pkgs.	48,700 pkgs.
1897-1898 ...	1,582,702 „	1,177,100 „	43,918 „

205 pkgs. Indian
33 „ Ceylon
44 „ Java
} Total 32,482 packages were offered in public auction this week.

The Average Price of Indian Tea sold on Garden account during season was 8·78d., against 8·64d. for season, 1897-1898; and 9d. 1896-1897, viz:

1898-9.	1897-8.	1896-7.
Pkgs. Price.	Pkgs. Price.	Pkgs. Price.
1,153,396 8·78	1,136,837 8·64d.	1,054,954 9d.

Indian. The market re-opened on Monday with a sale of 7,205 packages, of which 405 were New Seasons Teas. The tone was distinctly firmer, lower grades being slightly dearer. The few New Seasons were of somewhat poor quality.

Week's average of Tea sold on Garden Account 1898, 4,222 pkgs. average 8·14d 1893, pkgs., av. d.

Total Tea sold on Garden Account, 1st June to date 1899, 1,153,396 pkgs., av 8·78d. 1898—1,136,837 pkgs., av., 8·64d.

The following invoices of New Seasons Tea were sold on Garden account "Castleton" 30 packages, average 9½d., and "Chubwa Tea Co., Nonoi" 36 packages, average 7¾d.

Ceylon. On the resumption of auctions on Tuesday, bidding for anything up to 7¼d, was keen with rather dearer prices. Above this figure rates were maintained, but bidding was irregular, Pekoes and even Orange Pekoes sometimes realizing hardly better prices than Pekoe Souchongs in the same invoice. The Official Wire gives exports to U. K. for May as 8,500,000 lbs., against 9,500,000 lbs. same period 1898, and estimate for June as 10½ to 11 millions. Exports to U. K. from 1st January to end of May were 39,500,000 lbs. against 40,500,000 lbs. in 1898. Average for week 7·93d.

Ceylon Tea sold on Garden Account, 1st January to date 1899 423,181 pkgs., av., 8·38d. 1898—462,171 pkgs., av., 7·65d.

COCOA.

The market is dull. The auctions on the 30th ulto. went off slowly and prices were generally in buyers' favor. Of 2,512 bags Trinidad about one-half sold at about former prices. common dark mixed 49s, barely fair to fair 67s to 70s, good to fine 71s to 76s. Of 912 bags Grenada only a lot or two sold at 65s to 67s for good to fine, also part of 360 bags Jamaica at 63s to 65s, part of 59 bags Demerara, fair dark red 64s. 9 bags Montserrat were bought in. Of 564 bags Guayaquil 196 sold, Caraquez red 70s, Arriba early Spring 70s, Arriba, 1898, wormy 71s. 514 bags African partly sold, fine red 66s, pickings 40s. 66 bags Cuba mostly sold at 62s 6d. 14 bags Nicaragua, 43 Surinam, 116 Bahia, 25 Domingo, 540 Samana, and 198 Venezuela all bought in. Of 1,110 bags Ceylon 173 sold, blacks 46s 6d, broken 50s, small 53s 6d to 58s, fair red 71s, fine red 78s. By private contract small sales of Grenada have been made at 67s 6d.

PEPPER.

Black.—The market has been firm this week, but owing to the higher pretensions of holders business has been a good deal restricted. Singapore on the spot has been sold at 5 5/16d to 5⅜d, basis fair, and Tellicherry in same position at 5¼d. Singapore June-August (s.) offers at 5 9/16d, and July-Sept. at 5⅝d. At the close the market is quiet, owing to advices of large shipments.

The shipments of Black Pepper for the month of May compare as follows:—

	1st half.		2nd half.	
	1899.	1898.	1899.	1898.
U.K.—Sing....	20	70	340	90
„ Penang...	80 } 100	260 } 330	30 } 370	310 } 400
Continent ...	110	*nil*	140	20
United States ...	20	*nil*	560	100
Total tons ...	230	330	1,070	520

White.—This market has also been firm, but is quiet at the close. About 150 tons have been sold during the week, including Singapore on the spot, May-July shipment at 8¾d to 8 13/16d, June-August and July-September at 8⅞d; Penang, May-July and June-August at 8 3/16d, August-October at 8⅝d, and September delivery at 8 3/16d to 8¼d.

The shipments of White Pepper for the month of May compare as follows:—

	1st half.		2nd half.	
	1899.	1898.	1899.	1898.
U.K.—Sing....	*nil*	20	100	40
„ Penang...	80 } 80	120 } 140	*nil* } 100	120 } 160
Continent ...	50	*nil*	*nil*	20
Total tons ...	130	140	100	180

INDIA RUBBER.

Since our last, owing to pressure to sell fine Para, the market has declined rather rapidly. Large sales were made of June delivery hard cure at 4s. 1¾d. to 4s. 1½d., but we close with sales of July-August delivery at 4s. 0½d. and rather sellers at this. Scrappy negrohead, sales down to 3s. 3d. per lb.

At auction to-day there was a very flat tone and a large part was withdrawn. Small sales of Central American and Colombian scrap and slab rubber at 3d. to 4d. per lb. decline. Peruvian all withdrawn. Mangaberia sold fairly steadily and Mollendo was 1d. per lb. cheaper.

CINCHONA.

The shipments from Ceylon for the week ending May 9 were 8,064 lbs. only. At Amsterdam, on June 8, 4,956 bales and 500 cases will be offered. The total weight is 481,800 kilos (containing the equivalent of 829,920 oz. quinine sulphate), of which 73,382 kilos. is pharmaceutical bark, and 408,418 kilos. manufacturing bark. The manufacturing bark contains an average yield of 5·36 per cent. quinine sulphate, against 5·52 per cent. in May, and 5·21 per cent. for the ten auctions in 1898. There has been a fair amount of business done in druggists' barks lately, and in many instances lower prices have been accepted. The Java shipments in May amounted to 666,400 Amst. lbs., against 672,000 Amst. lbs. last May. The total for the five months is 170,000 Amst. lbs. under last year.

CINNAMON.

The quarterly sales of this article were held on Monday. Only a small offering was put up, comprising 784 bales of *Ceylon quills* and 2,645 packages of *chips*, but there was a good demand, and prices advanced about 1d. Practically all were sold at the fo... rates: Worked, first sorts, medium to fine, 1s. 1d. to 1s. 6d.; ... sorts, middling to superior, 9½d. to 1s. 6d.; third sorts, middli... superior, 8½d. to 1s. 4d.; and fourth sorts, fair to fine, 4½d. to ... For unworked, from 4½d. to 11½d. was paid for ordinary fo... good firsts. *Chips* were not in such great demand, and onl... packages sold at 2d. for coarse bark, 2½d. for ordinary chips, a... 7d. to 9d for quillings. Since the auctions, sellers of quills ... 11d. to 11½d. for firsts, 10d to 10½d. for seconds, 9½d. for thi... and 8½d. to 9d. for fourths.

Polli Betta, *28th June.—Weather.*—Light rain set in on Saturday last, and every day it is a series of light showers with bursts of sunshine between: ideal planting weather. *Crop.*—Berries have swollen to nearly full size and are showing up better. *Plant Diseases.*—With weather like this, leaf-rot will not have a chance of a look in, and leaf disease will be postponed to late in the season. *Labour.*—Plentiful. Canarese coming in. *Health.*—Good.

THE PROFITABLE USE OF FERTILIZERS.

Mr. E. B. Voorhees, of the New Jersey Experiment Station, lately contributed to the *American Agriculturist* an interesting series of papers on "The Profitable use of Fertilizers." Dividing his subject into four heads, he wrote a paper on the character of the crop and its method and time of growth; one on the character of the soil, and the previous treatment and cropping of the soil; and a third on the actual needs of the plant in reference to plant-food.

Many points in his remarks deal entirely with the cultivation of cereals and vegetables, and their only interest to planters in South India lies in the general theory that they enunciate. Mr. Voorhees observes that with some plants an abnormal, with others only a normal, development is wanted. In the former case crops must be supplied with a relative abundance of plant-food constituents in an available form; they must not lack food during any period of their growth, and because of the relatively high commercial value of these crops, the quantity of plant-food need not necessarily bear any relation to the amount actually contained in the crop grown. Neither is it so much a question of proportion of plant-food, as it is a question of sufficient plant-food. Where what is wanted is not the immature succulent growth, but the matured fruit or seed, the feeding should not be such as to encourage a too rapid growth, and in many cases an undue development of branch or leaf, but a normal early development and a consequent normal proportion of grain or seed. Besides, he observes, these crops growing through a long period as compared with the other may obtain a large proportion of the needed plant-food from soil sources, and because of their relatively low commercial value as compared with the others, there is a greater necessity for applying that particular element which is needed in greater amounts and thus reducing the actual cost of the application. In other words, crops are divided into two distinct classes or groups. First, those that possess a higher fertility value with a correspondingly low commercial value; and the second, those that possess a low fertility value and a relatively high commercial value.

Hence it is, says the writer referred to, that in the use of fertilizers a study of the crop from these standpoints should be made, and if it were made by the users of fertilizers there would be fewer cases in which the farmer would say, "Fertilizing does not pay." The method and time of growth of the different plants should also be taken into consideration in arranging the fertilization of the different crops. The most rapid development of many crops takes place early in the season before the conditions are favorable for the rapid changing of organic nitrogen into nitrates; they are therefore more specifically benefited by early applications of nitrogen in quickly available forms than by applications of fertilizers rich in minerals. Root and tuber crops also cannot make ready use of the insoluble mineral constituents, hence they must be supplied with a greater relative abundance of the phosphates, particularly in their early growth, than the cereals, and must not suffer at any time because of a lack of nitrogen in available forms, while potash must be supplied in sufficient abundance to meet their needs in this respect. This assumes, of course, that nitrogen or potash, or both, must to be artificially supplied to the soil. A very cursory study of soils will show that wide differences exist in them, both in reference to their chemical character or composition, and their physical properties, both of which characteristics have a direct influence in determining the effect of any specific application of fertilizers. A few general remarks on this point are given in the statement that sandy and gravelly soils are the poorest, both in respect to physical and chemical qualities, because particles of the soil are coarse and hard, thus permitting their very rapid drying and heating, and because their chemical composition is such as to make them strongly resist decay. Moreover, a decay, no essential mineral constituent is provided, t contain no phosphoric acid and potash, and hence on of this character before profitable returns may be exp from the use of plant-food, they must be improved in th physical character. And because they are so poor in th chemical character, their needs for added plant-food the growth of any crop are not limited to one or two the constituents, but must include all of the essential on Clay soils, on the other hand, are frequently rich in m erals containing potash and poor in those containing li and phosphoric acid, consequently with proper cultiva and management they are able to provide a sufficie abundance of potash for crops of a low commercial va for a long time. In the next place, limestone soils frequently poor in potash and rich in lime and phosphat thus fertilizers rich in potash are frequently more use than those containing the other constituents in grea proportions. Mr. Voorhees says:—"Regarding clas of soils in a general way, it may be said that potash i very essential constituent of manures for sandy soils, only because all crops require potash, but because th require it in relatively large amounts, and because sandy soils it is liable to exist in minimum amounts. the other hand, in clay soils potash is liable to exist considerable amounts, and the deficient element is m likely to be phosphoric acid, and this applied in abundan may enable the plant to secure the necessary potash. limestone soils, the lime and phosphoric acid, and perha the potash, may be in sufficient abundance to caus normal growth of plant, yet the nitrogen be so insuffici as to prevent a full development."

Previous treatment and cropping is no doubt an import matter as regards the general subject of Artificial Fe lizers, but we need not quote Mr. Voorhees on this point his remarks have only a very remote bearing, if any at on the planting of tea and coffee estates in this part of world. In his closing paper he observes that a study the amounts of the various constituents contained in different crops shows that they vary not only in the to amount, but in the proportion of the constituents contai in them. For this reason it has been urged that to sup a crop with the amounts and proportions of the constitue shown by chemical analysis to be contained in it will re in their most economical use. This method of fertiliza may result in a complete feeding of the plant, provided the conditions are perfect, but such recommendations not take into consideration that the plant that contai larger amount of one element than another may pos greater power of acquiring it than one which contai smaller amount. Neither do they take into considera that the period or time of the growth of the crop also e cises a considerable influence in indicating the capabili the plant acquiring its necessary food from the stores o soil. Here also, neither coffee nor tea planting is cially dealt with; but that is no reason why a useful hi two should not be derived from the scientific *dicta* given. As Mr. Voorhees explains, limits of space forbi detailed discussion of specific applications; but with suggestions he gives, "it is confidently believed that thoughtful farmer may apply them to his own conditi and thus secure a greater proportionate return applied to plant-food."

THE DRAFT ALLOWANCE ON TEA.

Tea and Red Herrings. By no means a combination
be despised by a hungry man. Still, when the subject
the abolition of the draft allowance on Tea is under
nsideration one does not want a red herring drawn over
ne track, even though it assumes the attractive form of a
riticism of London charges. Who started the fish on its
ay we cannot say, but the following list of the ordinary
harges on a chest of tea of 90 lbs., value 6d. per lb.,
as been given in a Home paper :—

	s.	d.
Freight and Shipping Charges	4	0
Warehouse Charges	3	8½
Calcutta Agency Commission	1	6
Brokerage and Sale Expenses	0	8½
London Agency Charges and Fire Insurance...	1	9
Total charge on a chest of tea ...	11	8

pon this it is remarked :—" Now, it is stated that the plan-
rs desire to economise; their argument is that in these
ays of competition the granting of the one-pound draft
eans that they have to give away a very large quantity
tea annually for the purposes of this draft, and that the
mpetition is now so severe that they cannot afford to
ntinue this gift to the buyers of their tea. They there-
re propose to adopt what seems to them the easiest way,
z., to dock the poor retailer of his one-pound draft. If
ey are so anxious to economise, why do they not deal
ith some of the numerous charges detailed above ? There
e certainly two items—the commissions in London and
alcutta—which ought to receive their consideration, and
would be interesting to know what the Calcutta agent
ally does for his 18d. Generally it seems that he does
t little more than allow his name to be used in forwarding
a and to collect the accounts of sale; surely 18d. is a very
rge sum for such small services, and might well be made
matter for consideration by these complaining planters.
ien there is the heavy item of freight and shipping
arges, which might also be the subject of revision.
nother writer attacks the above figures, and says he is
a position to supply some actual figures, extracted from
e 1898 accounts of a company in which he is interested "
ie company in question made in 1898 a total crop of
956,825 lbs. of tea. The number of packages was 22,930,
d the average gross sale price was 11 23-32d. per lb.
ie 1 lb per package draft was therefore 11 23-32d. per lbs.
22,930 lb, or, say, £1,119 12s. 7d. The Calcutta
gency Commission for the year was £474 13s. 1d. The
mparison in the case of the company in question is
erefore not 1s. 6d. for Calcutta Agency against 8d. for
e pound draft, but 4 31-32d. for the Calcutta Agency
ainst 11 23-32d. for the pound draft. The com-
ny in question does not pay any London Agency Com-
ssion, but the accounts show an item of £60 for rent of
ndon office, a moderate sum for office salaries, and
ditors' fees, and certain other charges, which it might
difficult to reduce.

This is interesting perhaps, and no doubt Calcutta and
me charges should be scrutinized as well as London
nditions of sale. But for the present the Planters' Associa-
ns concerned have taken the latter question in hand,
d they should deal with that before getting themselves
tangled in discussions of side issues. One argument in favour of the retention of the draft allowance is that this draft covers many losses which the buyer of the tea has to bear, and which, if the draft were abolished, would almost certainly be the subject of continual claims which would be vexatious both to the wholesale dealer and the importer. At present when these losses arise, the loser has to console himself with the allowance which he receives. It is sometimes to be doubted whether even that fully covers his losses, but it certainly goes a long way to reimburse him. Messrs. Brooke Bond & Co., Ld., define still more clearly the object of the draft allowance. They says :—" The 1-lb. draft has, from time immemorial, been allowed and sanctioned by importers to cover the losses sustained by the retailers in weighing out in small quantities from bulk, and to make up for petty leakages in transit, trifling damages in the tea itself, such as mouldiness and " cheesiness," irregularities in quality, and the inclusion of foreign matter, such as nails, chips of wood, coolies' belongings, and garden implements. It is certain, too, that such tacit and time-honoured allowance has saved the importers from being harassed and importuned, day after day, with innumerable petty complaints and claims on the above grounds, from wholesale and retail dealers—complaints and claims which would assuredly supervene if the ill-advised action of the importers should succeed, and it can only succeed through the supineness of the tea-dealers' representatives. Such possible difference between importers and dealers would not, in practice, be adjustable, and they would result in such infinite dissatisfaction that business between the distrusting, worried, and embittered parties would sooner or later become almost impracticable. Reprisals, too, obviously in the power of the dealers, but which need not be specified here, would ultimately cause the importers to wish heartily that they had let sleeping dogs lie." Again, at a meeting of grocers and wholesale tea-dealers at Manchester, one speaker said that the China trade, as they all knew, was practically abandoned by the trade, and they were almost all now selling Indian and Ceylon teas. The importers of those teas brought them over with a large leaf, and often an ugly leaf, and they who were in the trade had of necessity to provide machinery for dressing and milling to make the tea presentable and attractive as a saleable article. Then there was also the varying characters of the gardens from which the tea came, which had produced what they called expert tea-blenders, and these expert tea-blenders adopted various processes—milling, dressing, blending, and repacking—and in these processes there must necessarily be a loss in leakage. But the expert tea-blender had done something else. By his technical ability and by the aid of machinery he had produced and put before the public at a low price a tea which satisfied the public, which the importer could not have done unaided by the blender's skill. The public would not take the large leaf from the importers, and, therefore, the speaker considered that the natural result that had followed the expert tea-blender's efforts was the production of a high class tea at a low price, and a consequent marvellous extension in the sale of India and Ceylon teas. As a result of that there had been an extension of the importers' business as well as that of the wholesale dealers. In the processes of milling, blending, dressing, and repacking blenders suffered loss in leakage, and the one-pound draft

was an allowance to cover that loss. Therefore he did not look upon this one-pound draft as a gift in any sense of the term; he simply looked upon it as one of the ordinary expenses in developing the Indian and Ceylon tea trade.

It may be thought that we are dwelling too much on the buyer's view of the question, but, after all, the planter's view should be quite clear to our readers, and what has most to be studied is the arguments ranged together *in defence* of the draft allowance. Whatever the merit or the strength of those arguments, we cannot dismiss the thought that it would be most regrettable were any serious friction to occur between importers and dealers in England at the present juncture. There is no doubt that dealers have of late years been loyal to India and Ceylon, and have turned their backs on China, but they may still reconsider their position; and if they are led to do so, through any bitterness of feeling towards the importers of Indian and Ceylon teas, they may yet successfully engineer a revival of the China tea trade, which is far from being as hopeless as some people think it.

"EXCEPTIONALLY BAD" TEA.

It will be remembered that the introduction of the new Tea Regulations in the United States resulted in the placing on the market of very large stocks of tea that had previously been unsaleable, tea that might fairly be described as of a quality unfit for human consumption. The object of the regulations was to guard against and, in fact, to entirely prevent, the importation of teas of this class; but the immediate result was to give this very class a value that induced holders to pass it on as rapidly as possible to consumers. Somewhat similar evil effects appear to have resulted from the recent improvement in the demand for tea in England. The following memorandum issued by the British Customs' Board would scarcely have been sent out without good reason:—"The Board, having been informed that it is probable that, in view of disturbances in the tea trade, attempts are being made to procure admission of teas of exceptionally bad quality, think it desirable to renew the attention of the approved tea inspectors within the port to the importance of the subject, instructing them not to fail to submit samples of any tea of a questionable character within the meaning of the Sale of Food and Drugs Act, 1875, that may come under their notice in the course of their duties." Trade papers acknowledge that, owing to the competition in the tea trade, and the demand for low-priced tea, leaf of very inferior quality finds a sale. Quite recently the Chancellor of the Exchequer was interrogated on the subject. Sir J. Flannery asked whether his attention had been called to a statement in the Press that a quarter of the caper teas and half of the dust teas now imported should be confiscated under the Food and Drugs Act of 1875 by reason of their containing 20 per cent. of earthy matter and sand; whether he would explain the nature of the precautions taken by the Customs Department in London for the detection of such adulteration, and whether the number of samples analysed could be increased with advantage; and whether, having regard to the fact that the descriptions of tea above named were for the most part consumed by the humbler classes least able to protect themselves against adulteration, he would increase the staff of inspectors especially allocated to the duties of sampling and analysis of caper and dust te The Chancellor of the Exchequer, in reply, said: " attention has been called to this matter. The Boar Customs have, in view of representations made to th by certain firms and of statements in the Press, orde a full inquiry to be made. It is not easy, within t limits of an answer to a question, to explain the p cautions taken by the Board for the detection of t adulteration of tea; but I shall be happy, if the honora member wishes it, to supply him with particulars. T Board of Customs, as at present advised, do not c sider that there is any need for altering the existi regulations, but if, as a result of the investigation now progress, it should appear advisable to make such alterati or to increase the number of tea inspectors the necess steps will be taken at once Meantime a circular has b issued to the tea inspectors directing them to adminis the existing regulations with special care." This is g news, for with tea, as with coffee, planters must alw desire to push the sale of the genuine article, not that adulterants, or even so-called tea or coffee that is likely bring the genuine article into disrepute.

THE "WHOLE SECRET" OF COFFEE PLANTIN IN B. C. A.

The papers we lately quoted under the heading "Eurek have provoked discussion in the *Central African Times*, which paper we were indebted for them Some of the lett that have resulted are of a "chaffing" description, Mr. Kenneth Cameron is of a serions turn of mind. He s he did not exactly offer to reveal the secret of success coffee planting, but offered to reveal the cause of lig berry, chipped, or spotted berry, and considering he l found out this most important defect, the remedy is qu simple, although it has to be done with a little extra labo Seeing, however, that the *Times* states that, he makes offer to reveal the secret of successful coffee, well, he w be most happy to do so upon condition that he recei security of reward. Any plantation that can supply i gation in a dry season, manure, and his secret "will be most successful plantation, other things being equa Mr. Cameron asserts that when he has declared what "find" is, his brother-planters will at once admit that he l earned his £1,000—"it will not be necessary to show single estate that has benefited" by his process.

Another planter asserts that by far the majority of pl tations in B. C. Africa owe their failure to over-cropping immature trees. He says:—"A coffee tree doesn't att to full maturity till its fifth year, and if our local plant will content themselves with little or no crop the th year, and then judiciously thin out the crop on the tr so that they don't overbear in the fourth year, I am qu sure that, with a little ordinary care and attention, t will be able to pick a satisfactory crop, year after year. I have myself done, for the last six or seven years, off tr which have had the benefit of aforesaid treatment." T gentleman places his experience at the disposal of neighbours "free, gratis and for nothing," and Mr. Came has been exhorted to do likewise. Meanwhile the *B. C. Times* remarks that "a hopeful feature of the discussion s fact that we are beginning to admit that we know not about coffee culture and that it is time we were le

ng something." "That," says our hopeful contemporary, has been one of our main contentions all along, viz., that we are but learners, that in fact many of us never saw a coffee bush until we came out here. If, therefore, the past results and the present position have been attained (in a *new* country) by practically inexperienced novices, what may we not look for when, by accumulated experience, we do know something about coffee culture in Central Africa. What planter is there to-day who would not say that, had he to begin again, he would avoid this mistake here and that mistake there. Yet with all our blundering we have made hits—palpable hits—and to-day we are the richer by hard-won experience, and encouraged by a measure of success which, considering everything, is nothing short of wonderful. The prospect before us is of the best. The market is sure to recover. Freights must go down and if we are wise we will keep the wages of labour at their present level. With leaf-disease outside our borders and cheap labour, we have a margin to come and go upon which, if we only profit by experience, will yet land us at the goal of undisputed success." What would many of our readers give for a sanguine disposition such as this? "The market is sure to recover." But, *when?*

TEA FROM SEED TO CUP IN SOUTHERN INDIA.

(By Thomas Brown, Glendale, Coonoor.)

IV.

Tools.—The following tools are considered advisable for the first year:—

			Rs.	A.	P.
12	Doz. 9″ × 7″ Mamooties	@ 18/ =	216	0	0
6	„ 4-pronged Forks, Parkes' ...	@ 36/ =	216	0	0
6	„ Pitting Bars	@ 15/ =	90	0	0
3	„ Bill Hooks	@ 15/ =	45	0	0
3	„ Felling Axes	@ 24/ =	72	0	0
1	„ 6″ Blade Pruning knives	...	20	0	0
1	50-foot Metallic Tape, Chesterman's ..	...	5	0	0
2	Cross Cut Saws, 5 feet...	@ 5/ =	10	0	0
6	Pruning Saws	@ 1/8 =	9	0	0
6	Doz. Weeding Mamooties, 7″ × 5″	@ 12/ =	72	0	0
1	Ceylon Road Tracer	...	30	0	0
1	Doz. Pickaxes	... ...	15	0	0
	Set of Carpenters' Tools	... ...	50	0	0
	Measuring Chain	... ...	7	8	0
		Total Rs.	857	8	0

ving the balance of the money for baskets and contingencies. Cheaper tools are always available, but prove dear in the long run. The pitting bars should be cially ordered out of one-inch rod iron, and each bar ould be 4½ feet long. None of the bars sold so far correct. Axes should be good country-made ones, ped with steel, which are easily repaired by any village th and also by any jungle artisan. The cast-steel glish axes are a great source of annoyance, and fail in hands of the Indian cooly most lamentably. The edge ariably gets chipped, and then it is almost quite useless, ng irreparable. Mamooties are never the same after ng put into the fire. A good workman will use his nooty so that it never needs re-edging; but such men very few and far between!

Test for Value of Tools.—A good test is by weight, an wance of As. 1-6 per lb. for ordinary and As. 2 for ll tools. Very small tools, of course, run much higher. instance, £4 for 1 lb. of watch springs. To re-edge tools the usual price is one anna per tool and As. 2 for an axe. Re-tipping axe with steel, As. 2.

Measurements of Work and Rates.—Fuel is paid for by the stack of 10 0cubic feet, and the stacks are usually made 3 feet wide 8 feet 4 inches long and 4 feet high. The wood is cut into billets of 18 inches long by 4 inches wide. The cost is Rs.2 per stack. Green wood splits up easily, but dry is very difficult and expensive to split. The convenience of wood split, as here suggested, is very great indeed. Large logs of 3 feet length and any thickness cost Re.1 per 100 cubic feet, but these are useless for most purposes. Even great steam-boilers are better served with 18″ × 4″ billets than by larger wood. Light wood is best given away to coolies, or burned to make ashes.

Transport of Fuel.—The cost of transport by coolies is about Re.1 per stack per half-mile. Somewhat less by women. We have paid As.1-6 per 100 lbs. for a mile and a half down-hill (and have never had to move it up-hill) to contractors. A stack of 100 cubic feet weighs, when dry, about 3,000 lbs. as against the standard weight of a cubic foot of teak, *viz.*, 50 lbs.

Cross Cut Saws need to be kept constantly filed to do good service. A small 6-inch three-cornered file, costing As.4 will keep a saw in constant work for one month.

Consumption of Fuel.—A steam-engine usually burns 10 lbs. of dry wood per H. P. per hour. The Engineer's rule is 2½ lbs. of coal per H. P. per hour, and we have heard the statement frequently made that the same quantity of wood does the work at mills; but it has never been our experience to use less. Wood, down at Madras, is only about Rs.5 a ton, and coal, Rs.20, or four times the value; yet the Railways prefer coal to wood as being more economical, so that the low consumption of 2½ lbs. of wood per H. P. needs to be carefully tested before being accepted. Tea driers of modern make take on the average 1½ lbs. of wood per lb. of made tea. These are safe figures to work upon in reckoning out requirements.

Cooly Earth Tasks.—Contractors usually agree to cut 10 cubic yards per rupee if the earth has not to be carried far in excavations. In cutting narrow roads, where the earth can be readily moved by a mamooty, one often gets as many as 15 cubic yards per rupee. The following are tasks for a cooly per day with the approximate number of cubic yards in them:—

Roads .. 3 feet in solid, 20 yards task = $20 \times \frac{1}{4} \times 1 = 5$ cubic yards.
Pits .. 18 in. cube, 25 pits task = $25 \times \frac{3}{2} \times \frac{3}{2} \times \frac{3}{2} = 84\frac{3}{8}$ cubic feet = 3 cubic yards.
Drains .. 18 in., 15 yards task = $15 \times \frac{1}{2} \times \frac{1}{2} = 3\frac{3}{4}$ cubic yards.

In determining the cubic contents of the 20 yards of road, we have reckoned on an average depth of 18 inches, and as the cutting slopes up from 0 to 18 inches one-half of this or 9 inches or quarter of a yard is taken in the reckoning. In the drains, as the lower side is to be 18 inches, the cubic contents will be rather more than 3¾ yards. In measuring up excavations for buildings, take the length and width of the cutting in the solid in feet, and for the height take *one-half* the mean of several measurements at their highest levels, multiply the three quantities together, and divide by 27. Check your figures by taking roughly the number of yards long and wide excavated and the number of yards high of a column of earth left at about the centre of the excavation, multiply the three figures

together, and the result should nearly agree with the number found by the first calculation.

Revetment, and other rough stone work, is paid for by the cubic yard. The price usually is As.6 if the stone is near; up to Rs.1-8-0 if it has to be carried any distance up-hill. Carriage increases the cost very much. To find the cubic contents, take the length in feet, the average height in feet, and the width in feet, multiply all three together and divide by 27. In opening a very stony piece, we have found it a good plan to have the stone built into ballast walls 18 inches wide and 18 inches deep. This work costs about Re. 1 per 11 running yards or about 3 cubic yards per rupee, since in many places the depth will exceed 18 inches. The small excavation necessary for this work is made by the same man without extra cost. The road must be first traced and cut and the ballast wall so built that a six-feet roadway is left when finished. This gives a neat finished appearance to a field, but greatly enhances the cost of opening an acre, quite Rs.15 per acre being necessary if such work be undertaken. Heavier revetments, wider roads, all cost a deal of money. We have estimated at the lowest cost possible. It is for the owners to decide if they will have a more expensively opened garden. A broad gauge Railway costs Rs.1,00,000 a mile. To open a metre guage just one-half this sum. One must decide, at the onset, what he is going to have! We ourselves are inclined to the narrow gauge, as it pays best in India. In this connection, we may *record* that the Nilgiri Metre Gauge Railway, just opened for traffic, after being ten years under construction, has cost about 42 lakhs of rupees for five miles of flat country and eleven miles of Ghaut, raising mostly 1 in 12.

THE TEA CAMPAIGN.

The *I. P. G.* sides with the *Times of Ceylon* and says :—"We are distinctly of opinion that India's co-operation with Ceylon has so far been decidedly advantageous to the former. The two have worked hand-in-hand so far, and have mutually reaped the benefits accruing from the joint effort. While admitting that there is a difference in the qualities of Ceylon and Indian teas, it must be conceded that they are both manufactured on the same general principles, and are both 'pure' as distinguished from the sophisticated and 'faced' teas of China and Japan. The difference in quality is only in flavour, due to soil and climatic influences; but the particular *jats* cultivated by India and Ceylon are the same. We should certainly *not* advise South India to act for herself in the matter of finding foreign markets for her tea. There are other countries as well as South India that manufacture 'useful sorts' of tea."

We still hold to the opinion that South India should work separately. No one denies that India has reaped advantages from co-operation with Ceylon, and Ceylon from co-operation with India. But South India stands apart. If she *could* co-operate properly, we doubt if she would; and while her contribution is infinitesimally small, we hold that it is wasted. How much of the contributions have been wasted also, is a question that deserves consideration. The "campaign" has been a very *costly* advertisement, at any rate, and it would be interesting to know whether both India and Ceylon are satisfied that they have had a good return for their money. Our Calcutta co temporary has not overlooked the fact that a *Ceylon* fir has now secured the services in the United States of th late *Indian* Tea Commissioner!

NOTES.

Vanilla Sales in London. In future, vanilla sales are to b held in London once a month—o Thursdays.

Tea in Brazil. In 1897 imports of tea into Rio d Janeiro amounted to 103,004 kil in 1898 to only 91·915 kilos. Practically the whole w imported from England.

The Coccidæ of Ceylon. We have to acknowledge the r ceipt of Part II. of Mr. E. E. Green valuable work on this subject published by Dulau & C London. Thirty capital plates are given.

Brazilian Coffee. A Santos Report dated, 12th Ma 1899, says:—"Picking is going in several districts, and gradually rising receipts may expected by the end of May, quality depending upon t weather

The United Coffee Growers Co., Ld. We are glad to learn that t Company has proceeded to all ment, and has acquired land Coimbatore. It will first push trade in India, leavi export business to be taken up later.

Java Coffee. The clearances of the Dutch Co pany's Java Coffee in Holland d ing May were only about 17,450 bags, against 18,5 bags last year, and 23,500 bags in 1897, making the to amount for the five months 77,400 bags, in comparis with 84,600 bags and 86,500 bags in the two preceding yea

Good Reading. "The depreciated value of cof which is not only the great sta export of this district . . . but also of the entire count has suggested to those interested in the prosperity of Bra the necessity of developing other industries as sources national income." This is from the Consular report on t trade of Rio in 1898.

Coffee in Ceylon. The *Observer* says:—We learn fr a very experienced Ceylon plan that coffee in Udapussellawa at 5,500 feet elevation i more or less under dense shade, is cropping well this ye There is hardly any "bug" to be seen on this coffe

one at all where the shade is very dense, although the rop is just as heavy as in the open—indeed heavier.

olombo Tea Sales. At Colombo on the 21st ultimo about 11,009 pkgs. = 858,718 lbs. ere offered, of which about 9,054 pkgs. = 718,322 lbs. ere sold. Quality of teas offering at the sale showed a ight improvement. Competition was brisk throughout, nd prices for all grades were very firm, common teas owing a slight advance. The *Times of Ceylon* states that ood invoices were offered from Maskeliya, Monkswood, igh Forest, and Queensland.

aweed as Manure. Mr. J. Hendrick concludes from certain investigations and analysis at, weight for weight, seaweed is about equal in value to rn-yard manure, but differs from the latter in its higher ntent of potash and lower content of phosphoric acid. is claimed that seaweed must undergo decay before its trogen (rarely less than 0·5 per cent.) is available for ants or even ready for nitrification. The potash in aweed is in a very available form.

Quoque. In a letter to the *Mail* about Coffee prospects, Mr. John Logan, Sidapur, asks where were another correspondent of that per "and the hundreds of his brother planters" when the rrency matter came up? Surely, they have a right to ask o where was Mr. Logan? We do not remember that he ok any active part in the discussion of the subject by the P. A. S. I., and he can scarcely expect occasional letters the newspapers to influence Government's financial licy.

e Chundale-Sultan's attery Road. Wynaad planters will have learnt with pleasure that Government has sanctioned an estimate amounting Rs.88,600 for metaling the Chundale-Sultan's Battery ad. Possibly the cost of the work may be less than imated, for the Chief Engineer remarks that "the rate vided for collection of material is high." He observes t great care should be taken to section the road pro- ly before laying metal, and the consolidation should thorough.

iral Dewey at olombo. Liptons' have 'gone one better' than the P. A. of Ceylon. They have taken the occasion of the visit Admiral Dewey to present the whole of the officers and w with a five-lb. box of tea each. Mr S. P. Jeffery, the l head of the firm, seeing the Admiral at the Galle e Hotel on Saturday last, obtained H. E.'s permission ake the presentation. There are thirty-one officers on rd, including the Admiral, and 451 men; and each box bear the recipient's name.

Advertisement. Ceylon planters have been trying to turn Admiral Dewey to ac- t. They have presented to him, his officers and his 1,000 lbs. Ceylon tea, and have expressed the hope the recipients and all other Americans may learn to Ceylon teas. They have even given the gallant Admiral nt that as General Kitchener and his troops took on tea with them on their expedition along the Nile obtained a noble victory over their foes—who are doubtless coffee-drinkers—the virtues of tea (*Ceylon* tea, that is) must be beyond question.

Calcutta Tea Sales. At the Tea sales on the 23rd ultimo, 16,000 packages were offered, and 15,000 were sold. The sale was chiefly composed of medium teas, which showed a falling-off in quality from last week. Generally the sale lacked animation. Teas of all descriptions under eight annas were quoted a quarter to half an anna easier, the least affected kinds being teas for price Broken pekoes, between five to seven annas, were most neglected. A few invoices of Darjeeling teas, showing much improved quality, were keenly competed for, fetching full prices.

Sierra Leone Coffee. Early this year the Agri-Horticultural Society of Madras distributed a bag of coffee seed from Sierra Leone among planters and others. In expressing thanks for the Stenophylla seed thus sent to him Mr. R. Lamb, of Vyitri, wrote:—"I have a couple of 3 years' old trees of magnificent growth and free from disease (rust), but as yet they have borne little crop. They are now, however, showing spike in abundance and may do better during the coming year. *Arabica liberica* hybrids are doing very well with me, and if you would care to have half a dozen seeds I would send them to you with pleasure."

The London Tea Market. From Reuters' telegram of 22nd ultimo to Colombo, we learn that at the London tea sales prices were generally rather easier, but fine sorts realised full rates. Of 19,000 packages Ceylon offered, 18,000 were sold and of 12,000 Indians 10,000 changed hands. Quotations—*Ceylon* F. P. Souchong 6¾d., average of the net 7¾d. week; *Indian* average, 9½d. Cabling the same day, Messrs. Gow, Wilson and Stanton reported that demand was running on low priced teas, and that good liquoring Pekoes were in improving demand, Pekoes for price easier, average 8d. Contrast the two reports:—*Reuter* fine sorts realized *full rates*; *G., W. & S.* Pekoes for price easier!

Young Plants. The Honorary Secretary of the Agri-Horticultural Society of Madras announces:—We have now a nice stock of young *Cola acuminata* plants from 2 to 2½ feet high ready for distribution to Members. The following plants are also available to Members:—

Erythrina lithosperma.	Myristica moschata.
Artocarpus incisa.	Ochroma lagopus.
Erythroxylon coca.	Couroupita guineensis.
Theobroma cacao.	Albizzia sphærocephala.
Dillenia indica.	Spathodea stipulata.
Aristolochia gigas.	Swietenia mahogany.
Cordia sebestena.	Swietenia macrophylla

Dejected Coffee. In his report for 1898 the British Consul at Rio describes coffee as having been in "a most dejected state" ever since 1896, when prices commenced to fall, dropping from 63s. per cwt. to 29s. per cwt. at the present day. On more than one occasion, he says, the current price did not cover the cost of transport from distant districts in the interior. It is, he observes, fully expected by those interested that, owing to

neglect in clearing the trees, and the abandoning of the many new plantations opened up several years ago, every year will show a gradual diminution in the production of this article. Would that the same news came also from Santos!

Bulgarian Rose Crop. Following up the letter quoted in our last, the Kezanlik correspondent of the *Chemist and Druggist* writes on May 25 as follows:—"The danger apprehended from the late excessive heat has been averted, as, during the last two days, we have had copious rains throughout the entire rose districts, which means that we shall have a substantial crop of the very richest quality. In the place of the former hot-and-dry weather, it is now delightfully cool and fresh, and the distillation is progressing under exceptionally favourable conditions, so much so that the present harvest is likely to last three weeks at least. Nothing definite can be said regarding the fixing of prices until the final result of the crop is made known."

Camphor Plants. In the last Quarterly Proceedings of the Agri-Horticultural Society of Madras, we read:—Of the twenty-four plants received from the Royal Botanic Gardens, Calcutta, twenty-two plants have been distributed to Members and others. Those planted out in our gardens two years ago are now two to three feet high. Mr. Winterbotham, of Meppadi, Wynaad, reports that the two plants we sent him in October, 1896, are doing remarkably well; four feet high. Mr. S. M. Pritchard, of Yercaud, in his letter of the 18th March, says that the one plant sent to him in August 1898 made little progress till a month ago, when it began to make a vigorous growth. The elevation of Yercaud is not quite 4,000 feet; soil a virgin black, and the temperature never goes above 89° in the hot weather and the rainfall averages 50 inches.

Coffee Tabloids. A process has been invented and patented at Rio for preparing coffee in tabloids by a system of compression. It is argued that not only will there be less expense in exporting coffee in this form, but the consumer will be more certain of thus receiving for his use the pure unadulterated article. It has been estimated that some £100,000,000 of British capital is employed in public funds and enterprises in Brazil. This may be a liberal estimate, but no doubt the amount is very important, and it is perhaps somewhat surprising that so little of it has been invested in so profitable an industry as coffee planting. Probably the explanation lies in the fact that a certain feeling of insecurity exists as to the protection afforded to the property of foreigners in the interior of Brazil.

Coffee Shade. Writing to the Agri-Horticultural Society of Madras, last February, Mr. J. W. Minchin, Honorary Secretary, Nilgiri Agri-Horticultural Society, Ootacamund, wrote:—"I am desired, by the Committee of this Society, to thank you for the 200 seeds of the *Coffee stenophylla* which are to be distributed among the planting members of this Society. Mr. Rhodes James, of Coonoor, writes me that he wishes to obtain more seed of the *Pithecolobium polycephalum* which, he says, promises to be a very valuable shade tree for coffee. He reports that one tree from the seed, received through me from your Society in 1897, has grown well and is ap rently a faster grower than even the *Albizzia molucca* Can you assist Mr. Rhodes James, of this Society, in g ting any more of this seed?"

Tea Prospects in Assam. *Capital* says:—In the Cac District the weather is now v cold and unfavourable for the grow of tea, as 16·94 inches of rain fell in the district dur last week, and about four times the amount of rain us at this time of the year has fallen. Red spider is r disappearing, but mosquito blight is appearing. In Syl it has also been unusually wet, 22·59 inches of rain falli last week, and the low temperature induced thereby unfavourable for the manufacture of tea. In parts of t district over 100 inches of rain have fallen against 35 the previous year, and in Sylhet town 72 inches against in the previous year. In Darrang, Sibsaugor and Lakhi pur also too much rain has fallen for the tea crop, a unless the present stormy weather is succeeded by a per of sunshine, the quality of tea will suffer materially.

An American Tea Industry. The U. S. Secretary of Agric ture has been making a pilgrim through the Southern States, a in the course of his trip made an address to the Louisia Sugar Planters' Association, in which he announced it his purpose to push the cultivation of the tea plant in United States. He said: "I might say that during visit to South Carolina I became well satisfied that th is a new industry that you can take care of in this count and that is tea. You have all the conditions necessary produce fine teas under your latitude and under latitude of South Carolina. How much farther north I not know. There they have a fifty-acre tea farm wh was originally encouraged by the Department of Agri ture, and I propose to push that. I would like very m to have this industry developed. I know that Dr. Stu will give it some encouragement here, and I have no do it will become as successful as the best industry of United States."

Ceylon Enterprise. The *American Grocer* says Mr. Alex. Thomson, London, E land, representing Whittall & Co., Colombo, Ceylon, arri here last week, and left on Friday for Chicago, from wh city he will start for a trip through Canada and N England to Boston. It is the intention of Whittall & to open a New York office, in charge of Mr. Rich Blechynden, late Indian Tea Commissioner. It is purpose of Whittall & Co. to manufacture tea to meet requirements of the American market, so that jobbers m secure tea exactly adapted for any particular section matter whether it is fermented or unfermented. Besi this, Whittall & Co. will pay careful attention to marketing of straight Ceylon tea cured, as has been fashion for some years past. In short, it is the aim of firm to furnish American dealers with exactly that desc tion of tea that their trade demands. This step is tak in view of the steady increase in the trade in Ceylon in this country and in the belief that a branch in N York City which will put dealers in close touch with primary markets and obviate the necessity of dea

rough the London market, will be advantageous to all ncerned. The advantage of such a move is greater now at there has recently been established a line of steamers ading direct between Colombo, etc., and United States rts. The firm of Whittall & Co. is one of the largest of e kind in the world, and in the year 1898 handled one-nth of the enormous tea crop of Ceylon.

A Slander refuted." Referring to recent remarks of the *Morning Leader* about adulterated tea, Mr. S. Granthan writes that competition is too keen owadays, and the public too well educated to allow of the tail trader selling tea adulterated to such an extent. There he thinks the public place themselves in a false position—especially the working classes—is by purchasing the w-price canister tea, thereby contributing a so much rger percentage to the revenue than they would do with e better and higher price teas. The following table, blished by a leading firm of wholesale tea merchants, he inks, clearly proves this: If you drink tea for which you y 10d per pound, you are paying taxes at the rate of per cent. on the value of the tea, and so on in the following proportions:—

Common ...	1s.	...	33⅓ per cent.
Medium ...	1s. 2d.	about	28½ ,,
	1s. 4d.	,,	25 ,,
	1s. 6d.	,,	22 ,,
Fine ..	1s. 7d	,,	21 ,,
	1s. 10d.	,,	18 ,,
	2s.	,,	17 ,,
Very Fine ...	2s. 4d.	,,	14 ,,
	2s. 6d.	,,	13⅓ ,,
	2s 8d	,,	12½ ,,
	2s. 10d.	,,	11½ ,,
Choicest ...	3s. ..	,,	11 ,,
	3s. 4d.	,,	10 ,,
	4s. ...	,,	8⅓ ,,

course, tea adulterated to some extent does find its way London, but it is again exported to Holland and the lonies. Regarding tannic acid in teas, the peculiarity Indian teas is that the higher the grade the larger ount of tannin there is. It is evidently the result of ne quality in the soil, as China tea, no matter how coarse d old, does not contain it.

NOTICE TO CORRESPONDENTS.

"Planter."—Kindly authenticate your letter, and we will blish it.

GENERAL ARTICLES.

MANURING FRUIT-TREES IN HOLSTEIN.

A method of fertilising fruit-trees in vogue in Holstein is suggtive, and not unworthy of a trial. The trees, it is said, receive cultivation. and the fruit is large, sound, and produced in ndance. Every two years a few holes a re dug in the ground ut 4 or 5 feet from the trunk of the tree and about 1 foot deep, er and shallower in the case of young trees. These holes are d with liquid-manure about four times during the winter nths, and for young trees this is diluted with water. If there more liquid-manure than wanted, it is distributed over the surs of the orchard, using an old street sprinklingwaggon for the pose. There is no reason why manure water should not be d once or twice after it is seen what the crop islikely to be; of rse, not affording any at that season to treesnot bearing a crop, which are carrying only a few fruits, as to dose them would be ncourage, probably, an unnecessary growth of shoots. But in matter, the cultivator must be guided by the condition of the m, and of the soil.

TEA AT THE PARIS EXHIBITION.

We learn that our Indian friends are bestirring themselves about a better position than they had prescribed for themselves at the Paris Exhibition This is not the first occasion on which Ceylon has had to set them the lead. Our representatives had arranged for space, not only for a Tea House, but for tea tables; and now India complains of the small space she has for her tea, as compared with what Ceylon has But whose fault is that? We are by no means unwilling that India should increase her space; but it must not be at our expense; and we trust and believe that our representatives, both here and in England, will see that there is no curtailing of the space allotted to us We may even want more! —*Ceylon Observer.*

THE DEVELOPMENT OF COFFEE MARKETS.

Indian coffee-planters are not the only people who want to push coffee into consumption. A London firm, in the Brazilian coffee trade, said in a recent monthly circular:—

According to the data which we have published in our last two reviews it appears that, although the consumption of coffee has been increasing of late years, it has been, in ratio, disproportionate to the production. From this it has resulted that the markets have been congested during the past three years with heavy stocks, which had a disastrous effect upon prices. The total visible supply is at present 6,000,000 bags, and as the production of the year beginning 1st July next is estimated 15,000,000 bags, the market will have to deal with the prodigious stock of 21,000,000 bags, whereas last year, which was that of the greatest demand known, the total consumption was 14,328,800 bags. The probability is, therefore, that prices will go lower instead of higher.

As this product is of so much importance to the countries where it is grown that most of them are now passing through a severe commercial crisis, principally caused by the fall in its value, we believe, as we said in our last review, that the Government of the countries interested ought to make some effort in order to stimulate and extend consumption.

From a statistical article recently published upon this subject, we observe that the average consumption of coffee, in ounces, per head of population per annum, in various countries is as follows:—Holland, 370; Denmark, 347; Belgium, 176; United States, 155; Switzerland, 112; Germany. 78; France, 53; Austria, 32; Italy, 17; Great Britain, 11; Spain. 9; Russia, 3.

It is remarkable to see by these figures what a small consumption of coffee there is in some countries. If, by means of an intelligent effort, the average consumption could be raised to 32 ounces per head per annum, which is a very small amount, in the four last-mentioned countries alone, that would mean a total increased consumption of 4,00 ,000 quintals (cwt.), which would at once restore the equilibrium of prices.

We believe that a small levy of 5 or 10 cents gold per bag of coffee exported, imposed by the various Governments, would produce £12 ,000 or £250,000 per annum, which, if well employed, would be sufficient to obtain very important results in this direction.

It is to be observed that in the greater part of Europe the retail price of roasted coffee is now almost at the same rate as before the fall in wholesale prices. If large coffee-roasting establishments were established in various parts of Europe, similar to those existing in the United States, which would give consumers the benefit of the decreased prices, this would probably have the same effect in generalising and augmenting the use of coffee as it has done in that country.

By judicious advertising, by distribution of pamphlets showing the great merits of coffee as a beverage, directions for preparing it, and by other intelligent means of popularising it, much could be done. The Exhibition at Paris next year will be a good opportunity of inaugurating this work. The subject is too vast to be treated summarily in a market report, but it is of such importance as to well merit the attention of the Government interested, principal amongst which is that of Brazil.

Commenting on the allusion to a levy the *Brazilian Review* observes:—

Coffee is quite enough taxed already! Another straw will break its patient back. If anything is to be done for Coffee in the way of *propaganda*, it must be by private not Government initiative, as was done by tea planters in India and Ceylon.

HYBRID COFFEE IN THE STATES.

FREEDOM OF COORG COFFEE TREES FROM LEAF-DISEASE.

Mr. E. V. Carey writes from Selangor to the Editor of the *Tropical Agriculturist*, Colombo:—

In the year 1895, I got some Coorg Arabian seed over here and planted eight acres, in two patches of five and three acres each, on hills in the middle of large Liberian clearings.

From an economic point of view, this result was not a success, though at first the trees came on splendidly; but grown at sea level in this latitude, a satisfactory result could hardly have been expected: blossoms mostly brushed, owing perhaps to insufficient shade, and the trees have never at any time up to the present yielded more than 50 to 60 berries each. But the experiment has not been altogether without interest, inasmuch as plants raised from the seed of these trees are showing distinct hybrid characteristics, taking more after the Arabian parent, but being fuller in the leaf and with their primaries further apart At present the few hundred plants I have growing are only about six months old from seed, so it is impossible to say how they will turn out; but in view of Mr. Cameron's extremely interesting report upon coffee in Coorg, I need hardly say they will be watched most carefully.

Perhaps the strangest feature of this small experiment has been the fact that I have never seen a spot of leaf-disease on one of the Arabian trees yet, although the two small clearings are surrounded with Liberian, scarcely a tree of which is free from it. When the surplus plants were very thick in the nurseries, two or three, certainly not more than half a dozen, were attacked with a spot or two, and I then rooted up and destroyed the nursery, but though I have often examined the two clearings very closely, being struck by the strange phenomenon, not a sign of *Hemileia* have I ever detected.

RUBBER IN TRINIDAD.

The following interesting notes are from the Annual Report of the Royal Botanic Gardens, Trinidad:—

(*Castilloa elastica, Cerv.*) Rubber cultivation has been taken us with considerable energy during the year 1898. The principal kind used for planting was *Castilloa elastica, Cerv.* Auction sales of seeds and plants of this Rubber were well attended and good prices were realised, as there was considerable competition.

At the experiment station a small area was planted in July. Among the *Castilloa* has been planted at wide intervals the larger and slower groving *Hevea brasiliensis*, with the view to their becoming permanent occupants of the ground; it being the intention to bleed the *Castilloa* trees very hard for certain experiments, under which many may succumb.

Another area has been planted out under the shade of standing trees, in what is called the old cottage grounds. It has been found that where *Castilloa* is well shaded their growth is much more rapid and vigorous than in the open. To grow *Castilloa* without a certain amount of shade and shelter, would, in my opinion, be to invite a succession of slow and stunted growths. In its native countries it is always found in sheltered and protected lands and always becomes stunted in the open vega. Trees planted in Trinidad under standing shade have been found to thrive well, and soon become the picture of healthy growth. At the experimental station it was necessary to shade the Banana, Cassava, etc., and under these conditions, the plants have also grown well. In the Nurseries of St. Clair are several thousands of *Castilloa* plants in bamboo pots; a large proportion of which are already ordered for the next planting season. *Castilloa*, under favourable conditions in Trinidad, makes rapid growth and is probably better suited to the climate than any other class of Rubber, as it comes to maturity earlier, and can be handled with a minimum of previous planting experience. Specimens of the Rubber sent to England for valuation prove that our *Castilloa* trees are the best kind in cultivation. The large crops of seed now obtainable from *Castilloa* will make it possible at an early date to grow stems for the purpose of extracting Rubber from them in their young state. Stems of a year old have been found to contain some 8% of their dry weight in Rubber, and this amount has been extracted in the Laboratory. Whether the same percentage can be extracted in actual practice remains to be seen.

Hevea Brasiliensis, "Para Rubber."—This tree produces Rub of the finest quality, for which the demand is very regular. A tree, it is of slower growth than *Castilloa*, but, grown for a per nent crop, it will probably exceed that tree in value. The proves itself to be hardy, it can be handled with ease, and gro freely, although it takes a number of years before the trunk comes large enough to bleed regularly. Growing at the old gard the tree is seen to make itself at home on the hard and barren which there obtains; showing that, although it is a tree fond water and delighting frequently flooded valleys, it will also grow other situations. Specimens of Rubber made from these trees h been examined in London and valued at high rates.

I have noted that seeds of this kind of Rubber are being off in France at a rate of over £40 per thousand or 10d. each; and Ceylon rates of £3 per thousand on the spot—packing cases, freight extra—are being charged. The vitality of *Hevea* seed that of *Castilloa* is very fugitive, and great risk is run by plant in obtaining seeds from a distance. Our seed harvested in Nov ber was of excellent quality and fully 99% germinated.

A tree of *Hevea confusa, Hemsly*, formerly known as *Hevea spru* also bore fruit. The distinguishing characters of the seed ar large size, its angular form, and the softness of its outer cover when compared with those of *Hevea brasilinesis*.

What is apparently another *Hevea* has been presented to the periment Station by His Excellency the Governor, who obtai it from Dr. Carl Bovallius, who was recently exploring the terri of the Amazon, S. A.

These, when handed over, were in bad condition, as I proved cutting a sample lot before sowing. Out of 170 seeds, only s five seeds germinated, and only two plants promised to surv This *Hevea* has seed not more than half the size of those of *He brasiliensis*, and of much darker color.

Kickxia africana or *Iré Rubber* is obtained from a newly in duced African tree. A small section was planted out in Novem and so far as we can judge in so short a time, promises to do w This rubber has been seen in the African forests by Mr. Millen, acting assistant, who states that our plants are quite true to na Mr. Millen has shown me samples of material collected by him from trees in the African interior, which shows this rubber is li if at all inferior, to the best "Para." A parcel of seed sent to by Kew did not germinate so well as did the first lot received, but few plants were obtained from it. Every endeavour will made to extend the culture of this species, as it appears to b great promise and well suited for growth in Trinidad.

A report reached us from German sources to the effect that *K sia africana* does not produce rubber at all. Mr. Millen's evide however, satisfies us upon this point. In addition, however, it be recorded that we have trees sufficiently large to bleed on a sm scale, and from these trees we have recently procured latex, f which a small piece of excellent rubber was produced, which pro the report to have been a mere trade rumour.

Manihot Glaziovii or *Ceara Rubber*.—Some demand has se for seeds of this rubber. These demands we have had to refer e where, as we have no supply. There is one tree in the ga which is said to be some 25 years old, which bears a few s annually; but, although of this age, its stem is but barely six in in diameter. Some of our correspondents, however, are q sanguine as to its value for culture in Trinidad. Some few were planted a few years ago at the Chaguanas Convict Depôt. their condition is far from convincing proofs of its suitability our climate My own experience, the Ceylon records, and var other sources of information tend to convince that *Castilloa*, *H* and *Kickxia* are also preferable to *Ceara* for cultivation in Island. *Ceara*, when young, grows rapidly, and induces the vator in many cases to believe in a continuous run of gro which often proves disappointing. It has been reported by s who have visited the *Ceara* districts that the trees never grow large size. It may possibly be grown with economy in some mountain lands, unsuited for other products, but as a rubb producer I cannot undertake to give it a high recommenda The rubber produced is, however, of good quality.

Landolphia and *Ceropegia*.—African and Ceylon rubbers. T are both under cultivation, but at present there does not appe be sufficient inducement to plant them extensively.

Tabernaemontana crassa.—This tree is a reputed rubber-pro and was grown on trial in these gardens for the past few Having a tree which had attained a large size, it was bled

the latex was treated in different ways with a view of producing gulation without success. Eventually a substance was pro- ed which resembled in appearance a lump of chalk, or compact ch, quite brittle in character and certainly not rubber.

apium acuparium.—This is an indigenous tree which produces e quantities of mercilessly sticky gum or latex. This mate- can be handled, when immersed in water, or with wet hands tools and is scarcely likely to become a competitor with the er classes of rubber. So far we have been unable to coagulate uccessfully.

THE INCREASING POPULARITY OF TEA.

With the ups and downs of the tea-planting industry one fact is ceable, and that is that tea-drinking is on the increase. In e of the open hostility of the medical profession, tea conti- s to grow in popularity in countries where tea-drinking recognised institution, while it is gaining favour else- re. This is largely due to the enterprise of Indian and Ceylon ters. Tea has been "pushed" in recent years as it never was n China controlled the market, and the result is seen in the ving demand on the European Continent, in, the United States. in the British Colonies. Referring to this, we notice that the e pays tribute to the work of popularising tea. It says: ter a long and costly struggle, Indian and Ceylon teas are fast quering the whole world of consumers by their now recognised eriority. Australasian prejudice was the first to succumb; then wed South Africa; the United States and Canada made a ler fight, but they, too, have given way; while Russia, the test market of all, is largely and continuously increasing its ortations." The *Globe* then refers to South America as a for tea, and alludes to the consumption of maté. In some s of South America, Paraguay tea is popular; but there is ty of scope for pioneer work in the introduction, or rather pushing, of Indian and Ceylon tea in Brazil, the Argentines, i, Peru, and the other South American States, where up to the opportunity for purchasing good tea has been very ted.

E PRESENT POSITION OF THE TEA INDUSTRY.

he following is from a "Communicated" article in the *Planter*:—

the present stagnant state of the tea-share market is any rion to go by, and is any indication of the trend of affairs, e can be no doubt as to what expectations have already been ed, by the investing public, of the prospects of the season h has been entered upon. I will quote from Calcutta share- ket reports: "*June 7th.*—Tea has been neglected for the most during the past week, and quotations are hardly so strong as were a short time ago; they will doubtless get a turn again n the bazaar finds time to turn its attention to them." "*June* —The tea sales having gone rather flat to-day, and prices being ewhat easier. there are more sellers than buyers of tea scrip afternoon, with the effect that quotations are hardly so strong ey were a few days ago." "*June 12th.*—Tea is quiet with noth- loing." "*June 14th.*—Tea shares are for the moment somewhat nd prices are at rifle easier. Tea is neglected for the moment." *ne 15th.*—Tea shares are taking a rest." "*June 17th.*—In tea, have only been a few casual transactions this week."

ese reports, representing as they do, the true state of tea-share market, show that tea shares at present are a drag e market The serious part of the business is that, notwith- ling the attempts of interested parties to bolster them up, they ot likely to "boom" again for some months to come The in- ng public have gauged the fact that the roseate hues which d the horizon a short while ago have now faded away. The nt state of the tea market does not warrant over-pleasant an- ations. Only a few months ago tea prospects were held out as most encouraging, brighter, in fact, than they had been for ; stocks had been reduced to a minimum; "in spite of larger oduction in India, the supply to the country (United Kingdom) hown very little increase, outside markets having developed iently to absorb nearly the whole surplus," etc., etc. Such the assurances contained in the home brokers' reports; but what said the Board of Trade Returns for April 1899? "Tea—The receipts were quite normal, but the duty payments, in anticipation of a higher impost being levied, were puffed out far beyond the immediate requirements of the trade, and the bonded stock was made to look very small." A rose of another colour, putting quite a different complexion on the state of affairs as presented to the public. Taking into consideration the last two tea sales and the present state of the tea-share market, what do the indications point to? A boom or a collapse? If, as has been stated, buyers in the Calcutta market have lost from 1d. to 4d. a pound over their purchases when reselling in the London market, will they not have to recoup themselves by certain manipulating of their further purchases? Does this not mean that there is bound to be a drop in the prices realised at the local sales? Again, in spite of the repeated warnings of the Calcutta tea brokers relative to the absolute necessity that exists for the proper regulation of the shipments of tea to the London market, what has been done? Why nothing more or less than the adoption of the most suicidal policy that could possibly have been followed. An excess of 4,526,629 lbs. of tea over the corresponding period last year has already been exported: in other words, up to the 16th of June 1899, the glut of the home market has already been taken in hand by about five million pounds of tea being shipped in excess of last year's supplies to same date. Can any other than an immediate drop in prices be the inevitable result? What is the reason furnished for thus rashly rushing forward these teas home?—"to catch the rates ruling for low priced teas." Will it not be a case of the exporters being "hoist with their own petard"? But this, unfortunately, will be the least part of it; down will go the prices, never to rise again this season.

A correspondent "Seller," writing to a contemporary, on the 4th of June, 1899, commenting on the Report of the General Committee of the Indian Tea Association for the year ending the 28th of February, 1899, says, among other things:—"There is one other matter I would like to refer to, and that is, *the collapse of the tea market last year.* I am somewhat surprised no reference is made to this in the report before me. Surely *the question of how to get a fair return for our produce is the all-important one to us growers*? What where the causes that led to prices falling lower than we have ever seen before? I know the unfortunate estimate had a deal to do with it in the first half of the season, but rates did not rise until long after it was quite apparent that the crop would be a short one. Prospects for the present season seem bright just now, but is the position one of security? Cannot the same influence in Mincing Lane that last year forced prices down to starvation point and hurried many concerns into liquidation come again into operation, and turn our morning into night? We are an Association of Growers—is it not a fact that at present we are practically entirely at the mercy of a Mincing Lane ring of buyers? Our brokers have gone to some trouble to enlighten us as to *the causes that brought about last year's collapse*, and our best thanks are due to them for doing so. Messrs. Cresswell and Co. state these to be:—"Too rapid transit from garden to London; concentrated buying power in Mincing Lane; forcing of the under 1s. canister; quantity of unsuitable tea shipped on garden account to London; together with the paucity of quality." I do not know whether Messrs. Cresswell and Co. have hit the right nail on the head or not. I do not think it fair that we should have to rely entirely on the statements of our brokers. It seems to me a matter that should engage the earnest attentions of the Committee of this Association. Where shall we be if the "under 1s. canister," to which Messrs. Cresswell and Co. refer, is rated lower for this season by the gods who rule us in Mincing Lane? Possibly some of your readers will smile at the ignorance of the position displayed in my remarks. If so, I make bold to say it is ignorance shared by other producers. and we look to our Committee for 1899 to put us in possession of the facts and to devise some means of protecting our interests. As growers, are we unreasonable in asking this Association during the present year to concentrate its energies in helping us to deal with our produce to the best advantage, and to lessen some of the burdens that now oppress us. There is, I am sure, amongst our Committee more than sufficient talent if put forth, to form a 'scientific expert for the tea district' who will successfully combat the Mincing Lane mosquito and the spider of the London Warehouse." The writer places the blame for the present unsatisfactory state of affairs, more or less, on the shoulders of the Indian Tea Association. In his opinion it holds the talismanic panacea-

which is to remedy all existing evils. But does the "Open sesame" of a possible future millennium for the tea industry lie with it? I think not; certainly not entirely; for the Indian Tea Association is composed of the members of various tea-agency and tea-brokers' firms, who are more or less subject to higher authorities—Boards of Directors and Shareholders. The members of the Association and the firms which they represent have, however, most responsible duties to perform, to which I will refer further on. In the performance of these duties they have been somewhat slack, and have been "called to book" in the public prints. Climatic conditions, such as depressing heat, should not be put forward as an excuse for ennui, when important business matters have to be transacted. There appears, further, to be a certain want of combination among the members. But the Association is now waking up to a sense of its responsibilities, and doubtless before long, "sellers" and planters (who form the "Association of Growers") will have no cause to complain of want of energy on its part, for it is now quite alive to the seriousness of the present position of the industry in this land; and as some of its members have a large stake in the industry, all questions relating to it affect their own pockets.

MATTE TEA.

Brazil.—Curityba is the centre of the "matté" industry, which employs nineteen mills in the town and suburbs. The preparation though simple, is all done by machinery. The raw material arrives in sacks of about 1 cwt. from the interior At the mill the leaves and finer stems are separated and ground to dust of various fineness. The thicker stems serve as fuel. The Argentines prefer dust "matté," and as they suck it through a "bombilla" are not inconvenienced by the floating particles; but there is no reason why it should not be prepared in the leaf like tea. The decoction has a greenish colour. The taste is agreeable, but not so aromatic as tea. It is stated that "matté" is peculiarly sustaining; that it is a digestive nerve tonic and cure for sleeplessness. The "Gauchos" of Rio Grande, Uruguay, and Argentina are the chief consumers, and will do a hard day's work with no other nourishment. Mr. David Carneiro, whose mill we visited, employs about thirty men, and when in full work the daily output is between eighty and ninety barrels of about 250 lbs. The dried leaves and twigs, as they arrive unprepared from the interior, cost on an average 13 milreis, or 8s. 8d. a cwt., and the price prepared at Curityba averages 23 milreis, or about 15s. 6d. a cwt. The retail price at Buenos Ayres varies from 20s. to 50s. a cwt Mr. Carneiro is endeavouring to create a market for "matté" in Europe, and stated that duties, freight, &c., paid, it can be sold in France at one fr. a kilo. An agent has already been secured at Paris, and another in London. If "matté" drinking ever becomes popular in Europe, it will be more probably among the labouring classes, on account of its cheapness and sustaining qualities.—*British Legation Report from Rio de Janeiro.*

TEA CULTURE IN ASSAM.

ANNUAL REPORT.

The official report on tea culture in Assam for the year 1898 states that as in previous years, the greatest number of tea gardens, 190, is in the Cachar district, Sibsagar comes next with 173 gardens, Sibsagar has the largest area under tea, 75,945 acres, and Sylhet stands second with 71,660 acres. Sibsagar gave the greatest outturn during the year, closely followed by Sylhet, Lakhimpur shows the best average outturn with 450lbs. per acre. The total number of gardens at the end of 1898 was 818, against 822 in 1897, showing a decrease of four gardens. The number of gardens closed was thirteen, as compared with two in the preceding year, and six gardens were amalgamated with other gardens against two in 1897. The decrease of 12,293 acres in the area of tea gardens in Cachar is apparent only, and due to the exclusion of the areas of abandoned gardens, which were erroneously included in the returns of previous years. Out of 818 gardens, statistics have been furnished in respect of 734 gardens, against 755 in 1897, and estimates had to be framed for eighty-four gardens, as compared with sixty-seven in the preceding year. This increased reluctance to supply information is to be regretted, but the Chief Commissioner's thanks are due to those managers and agents who have furnished the required information. There was an increase in the number of persons employed both permanently and temporarily by 23,191 and 3, respectively. The increase in the number of persons permanently employed was general throughout all the districts in the province except Kamrup, and is attributed to importation of labourers. The increase of 14,987 acres, which is distributed among all districts except Kamrup, is due partly to the opening of new gardens and partly to extensions of cultivation in existing tea gardens. The decrease in Kamrup is due to several gardens having been closed during the year. The decrease of 20,027 acres, in the total area of land taken up for planting, but not yet planted, as compared with the figures of the preceding year, is due partly to the extension of cultivation and partly to the revision of the figures previously returned for the Cachar and Nowgong districts. The total outturn of tea during the year was 109,071,367 lbs., against 107,266,332 lbs., showing an increase of 1,805,035 lbs. The decrease of outturn in Cachar, Sylhet, and Nowgong, which was the result of insufficient rainfall, is more than equalised by the large increase in Darrang, Sibsagar, and Lakhimpur, due partly to favourable weather and partly to extension of cultivation. The yield per acre for the Surma Valley, the Brahmaputra Valley, and for the whole province, according to the district returns, is shown below:—

	1897.
	lbs.
Surma Valley	440
Brahmaputra Valley	384
For the whole Province	408

The Indian Tea Association expressed their inability to furnish any information this year under the above head. Only 1 maunds of tea seed were returned as imported from Manipur against 8,484 maunds in 1897. This result was due partly to failure of the crop and partly to a falling-off in the demand. It is said that much of the seed inported in the previous year from Manipur proved unsuccessful, having been plucked before it was fully ripe. There has been a general and steady fall of prices since 1894. The rainfall was generally below the average. In Cachar and Sylhet it was specially deficient and less than in any of the previous five years. The causes which affected the season's crop are noticed by the Deputy Commisioners as follows:

Cachar.—The long drought, which practically lasted from October 1897, to June, 1898, and the cold weather in August and September affected both the quality and the quantity of teas produced. Blights were rather less prevalent than usual. The season generally was a deplorable one for Cachar, and prices for Cachar teas both on Calcutta and London are said to have been lower than they have ever been before.

Sylhet.—The rainfall was insufficient, the total recorded at Sylhet station being the lowest for at least twenty-five years past. The fall was also badly distributed, and, although the latter part of the season was more favourable, the improvement came too late to enable gardens to make up ground cost earlier in the year. Blight was not at all prevalent.

Sibsagar.—The rainfall was far below the average of the last five years, and was not fairly distributed. The weather was favourable for quick flushing in the early part of the season, but constant rain in July and August, and the absence of sufficient sunshine checked manufacture during what ought to be the busiest part of the season. The Sub-divisional Officer, Jorhat, remarks that "it is generally agreed that at the outset it promised well, but the drought occurring in May and June produced in some gardens various kinds of blight and generally checked the outturn of tea. This was followed in July and later months by continuous spells of wet weather with a consequent reduction of temperature alternating with short periods of hot dry weather, the coldness of the former and the dryness of the latter periods being equally favourable to the growth of leaf."

Lakhimpur.—The year on the whole was a favourable one for tea as regards output, but prices did not rule high. The spring and summer months were favourable, and the bushes flushed freely, but the autumn was too cold and the season closed early. During the last week of August there was a very heavy fall in some parts of the district which checked yield on low-lying gardens. Rain in some parts was badly distributed. On the whole, there was not more blight than usual, though on some gardens thread blight interfered with the yield. Taken all round the year was a healthy one for the labour force, but as far as concerns the class of labourers imported, from famine districts in particular, was not so good as usual.

LANTS STARVED BY EXCESSIVE NOURISHMENT.

There is an experiment well known in physics which consists in parating a receiver into two equal parts by means of a porous mpartment, into one of the parts putting plain water and into e other sugared water. After a certain time the plain water ab-rbs all the sugar and leaves the other impoverished. A double irrent has been set up between the two liquids; the one more pid and more abundant, from the less dense to the denser liquid, called endosmosis; the other of the denser to the less dense liquid exosmosis, or the weaker current.

Plants assimilate their mineral nourishment through the free rtions of their roots, which are composed uniquely of cells. Now e vegetable cell contains in itself a living substance called pro-plasm, which has the consistency of a thick liquid. The envelop-g part is a membrane called cellulose, which is traversed by all quids that come into contact with it. So when we water a plant th ordinary water, as the water is less dense than the liquid in e cell. the two currents, endosmosis and exosmosis, are set up. hich current is the stronger, the more rapid? The less dense to e denser—that is to say, the water towards the interior of the l. For ever so little the water dissolves some nutritive elements its way through the soil to the roots, it transmits those elements the protoplasm. But should some inexperienced gardener, in e hope of imparting more nourishment to his plants, add to the ter a too strong proportion of soluble manure, he increases so the density of the external liquid, that the liquid within the l becomes the less dense and acquires a more rapid flow from the erior to the exterior. The result is impoverishment of the cells d loss to the plant of more than it gains, resulting in starvation. e question, therefore, how much manure to add to the water in tering, so as to avoid making the water heavier than the liquid thin the cell is one of importance to gardeners. Given the fact at the sap once it enters the roots contains about four grammes soluble matter to the litre, it is easy to decide that the water ould contain less than four grammes of soluble water in order to up the more rapid current. A gardener, therefore, who wishes nourish his plants will take care to add less than four grammes such matter to the litre in watering.

Another question is, how much water or liquid manure should be ministered to each plant, especially plants in pots? It is self-dent that everything must depend on the kind of plant, its state vegetation, the surrounding temperature, etc. *Savants* by ans of experiments have been able to tell us this also, and they ree in stating the quantity to be three to five. That is to say, if plant can absorb three parts of liquid, it is necessary to ad-nister five parts to it. But what we have especially to bear in nd is the fact stated, which explains why the books never advise addition of more than two to three grammes of soluble manure the litre of water when the object is the nourishment of plants h liquid manures.—E. Courtois, in the *Revue Horticole.*

TEA PROSPECTS.

From the Annual Review of Indian and Ceylon Tea by Messrs. n. Jas. and Hy. Thompson, we quote :—

The production of large crops of low-priced tea should be left to se who can attempt it with the least hazard. It would be most rudent for those in Assam. Darjeeling, or the highlands of ylon, whose estates can yield tea of fine quality to risk their -eminence. We have behind us the evidence of many years that nand for fine tea is an assured and constant feature of the home rket, and although, for the time being, those who produce it y not be getting their due proportion of profit, this will be ad-ed when liberal supplies once more come forward and the nor-range of value between fine and common tea is re-established. n ideal crop would be one containing the widest possible variety haracter and value, with enough of the best to meet the home land and to maintain the reputation of British-grown tea all r the world, and with a sufficiency of such as growers could rd to sell at low rates, in order to increase our trade abroad by planting the produce of other countries. New markets can her be opened nor kept open with short supplies and high prices. ecognizing how much of encouragement there is in the present tion, we feel there are too many uncertain factors of the problem atify the very sanguine forecasts in which some have indulg-ed:—the quantity that may possibly be drawn from China by the prices now ruling is unknown; Ceylon, as well as India, is liable to suffer, and has suffered from drought and blight; in India the difficulty of getting coolies increases; and though freights may be lower. an exchange at 1s. 4d. has still to be reckoned with. On the other hand, the Home Trade is in a strong position, abundantly supplied with capital; the advance in quotations was a genuine movement, entirely due to the fact that supply had fallen short of demand and not to any artificial manipulation of the market; stocks are lower than they have been since 1886, when the annual turnover was 50 million lbs. less than it is now and the price of tea 50 per cent. higher; and, although an increase in the importation from India may be expected, very little more will come from Ceylon; there is consequently not much reason to expect to total supply from these sources will be larger than we require here. provided that a free consumption at home and abroad is not hindered by very high prices at the outset.

As regards home requirements for the coming season, it should be safe to take the year 1898 as a criterion. The Board of Trade returns show that in that year we used at home or sent abroad 141 million lbs. of Indian, 94 million lbs. of Ceylon and 36 million lbs. of China and Java tea:—total 271 million lbs. We should, therefore, be able to handle here without much difficulty during the season ending the 31st May, 1900, about 145 millions from India, 95 millions from Ceylon, and 35 millions from elsewhere—say, a total of 275 million lbs.

We refrain from details relating to manufacture, assortment and so on, respecting which managers must already be in possession of the information they need: but inasmuch as it is desirable that the requirements of Continental and American buyers should be studied by those who can produce the sort of teas they take, it may be useful to mention that the *desiderata* for those markets are —an even leaf, not broken or dusty; flavour rather than strength; aroma on the dry leaf: large breaks and sound packages made of the best material.

HEPBURN'S COFFEE ROASTER.

A meeting of those interested in the Queensland coffee industry was convened at Cairns for the purpose of hearing Mr. Hepburn demonstrate the advantages of his patent roaster. Unfortunately, the time named for the meeting did not allow many growers to be present, as the train to Kuranda left at 4.30.

The *Cairns Argus* says:—Those few who were present expressed themselves as well pleased with the apparatus, and Mr. Mayers, President of the Kuranda Coffee Growers' Association, invited Mr. Hepburn to pay them a visit at Kuranda, where he was sure a large number of growers would attend and listen to his description of the use of his roaster.

Mr. Hepburn in explaining his system of sun-drying coffee said: The chief improvement that I claim on other systems is the rake that I use. It is so constructed that it fits the tray, thus rendering it a quick and easy matter to turn the beans, so that they are exposed to the air. My rake can be adjusted to suit any make of tray. I have handed over to Mr. Newport (the coffee expert) 6 trays with stands and 2 rakes. and Mr. Newport has sent them out to Kamerunga Nursery which I understand is to be the place where coffee culture experiments are to be made. You know, gentlemen, the amount of work, and valuable work at that, which lies before Mr. Newport, as coffee expert, not only for this district but for Queensland generally, and I am sure that if he expresses approval of my apparatus, you may rest satisfied that it is a good article. The trays that Mr. Newport has, have been specially constructed to bear extra handling, with the idea of their being sent to different farmers as samples. I would like to say a few words as to the deputation to Mr. Chataway last year, at which Mr. Mayers represented the coffee growers. Mr. Harper, who represented the merchants, stated that the coffee grown in Cairns was not up to the desired standard. Gentlemen, I am sure that all that is wanted is more careful attention to the curing of the coffee. From enquiries made by me, I am satisfied of the great productiveness of the coffee tree in this district, and I am fully satisfied that it is an industry that will become a great success in this neighbourhood.

Mr. Hepburn then gave a practical demonstration of the use of his apparatus, and ended by presenting a complete set to Mr. Mayers as President of the Kuranda Coffee Growers' Association.

TEA, &c., COMPANIES.

The Dooars Tea Co., Ld., has declared a dividend of 7 per cent. on the preference shares; a dividend on the ordinary share capital of 10 per cent. and a bonus of 2½ per cent. for the same period; and that an *ad interim* dividend of 5s. per share having been made on account thereof, the balance—*viz.*, £1 per ordinary share—shall be payable on and after June 1.

The Southern India Tea Estates Co., Ld.—The fourth annual ordinary general meeting of the Southern India Tea Estates Company, Limited, was held at the offices of the Company, 16, Philpot Lane, E. C., on Wednesday, the 31st May, Mr. W. Forbes Laurie presiding.

The Secretary having read the notice convening the meeting, the Chairman, in moving the adoption of the report and accounts, said:

The report, I think, clearly shows our position, and I do not think that I can add much to what you will find in it. As the report tells you, prices were very low last year, being much lower than those for the previous year, and not only for Southern India, but for the whole of India and Ceylon. It was also an exceedingly dry year, and we suffered a great deal from drought. The estimate for the coming year, so far as one can see, is almost sure to be attained, and if only the present prices continue, I do not see why we should not have a very good year indeed. I may mention that a great deal of land we possess is not yet in bearing, and the outlay, of course, for bringing it into bearing has been going on. This year 197 acres will bear, and afterwards we shall have an increased crop from year to year. I am certain, as far as one can be certain, that this year will show a very great reduction in the average cost of our fine tea land. That which is now in bearing costs about £40 per acre, but when this land I have told you of comes into bearing, it will reduce the cost to £32, without deteriorating the quality of the tea. This will, of course, greatly improve our position as regards our property, although we shall have to wait to secure these good results. I shall be glad to answer any questions put to me, with relation to the accounts, before moving the adoption of the report. You will see we provide for a dividend of 2½ per cent. and I think, under the circumstances, we must rest content with that.

In reply to a question from Mr. Walthew, the Chairman said the average nett price for tea was 6·04, and the gross price was about a penny more.

Mr. Walthew then asked why the Company. instead of carrying forward so much, had not paid a little higher dividend. Last year they had only carried forward £207, and as they expected a much better year this year, why should they carry forward a sum of £475?

Mr. T. C. Owen, in reply, said that it was really a question of funds. There had been a great increase of capital expenditure, there was a certain amount of money due for the capital during the year, and there would have to be more during the next year. They had also been unsuccessful in their endeavours to place preference shares, only securing £250 out of the £2,000 they had hoped to raise for the increased expenditure on the estate. The cash position of the Company was not a very strong one, and they did not think it advisable to divide the dividend up to the hilt. Mr. Owen also mentioned that they had £300 to write-off for preliminary expenses, and they had only paid £80 off this last year, and £60 the year before. In fact last year they had excused themselves for paying off so little by promising to write-off a couple of hundred this year. Under these circumstances, he did not think the £113 carried forward for this purpose at all too much. Indeed, it was the usual thing to wipe off the preliminary expenses in three years.

Messrs. Whyte and Austin strongly advocated the advisability of paying a slightly higher dividend, the former remarking that it would give a much better appearance to the Company's affairs. It was at last formally moved by Mr. Whyte that with the approval of the auditor, a dividend of 5 per cent on the ordinary shares be declared.

This was seconded by Mr. Walthew, and carried.

The Chairman, in reply to a question from Mr. Whyte, said that they hoped, with anything like ordinary weather, to attain the estimate for the crop. As regards prices, he might mention that ¼d per lb. made a difference of 1 per cent. to them. He also mentioned that the income-tax in the report was both for the previous year and this year.

The re-election of Mr. T. C. Owen as a Director of the Company was then proposed by Mr. Austin, seconded by Mr. Walthew, and carried unanimously.

Mr. Walthew then proposed the re-election of the Auditor, Mr. J. D. Stewart Bogle, which was seconded by Mr. Whyte, and carried unanimously.

A vote of thanks to the Chairman concluded the meeting.

Great Western Tea Co., of Ceylon, Ld.—Outturn 313,425 lbs., average 48·15 cents. Cost for Colombo 35·98 per lb., including 3·56 cents. for manuring. Dividend 6½%.

Ceylon Tea Co., Ld.—The working of the Company during the past year was satisfactory, and the accounts would have shewn a credit balance, but for R2,877 having been written off as a loss through the failure of the New O. B. C. This left a debit balance on the year's working of R778.

The Directors hope to declare a dividend next year.

The Claremont Estate Co., Ld.—An extraordinary general meeting of shareholders in the Claremont Estate Co., Ld., was held at Colombo on 17th inst. The minutes of the extraordinary general meeting, held on the 3rd March last, were confirmed; and the financial position of the Company, and propositions as to the method of meeting the present liabilities were considered, when it was decided to sell the property. Theestate is said to be in a very flourishing condition, and the prospects of a good profit during the coming year favourable.

The Malay States Coffee Co.—The report states that Mr. W. P. Metcalfe visited the Company's property in March last, and a copy of his report has been circulated amongst shareholders. Further funds being required for the upkeep of the Estate, a fourth call has been made, bringing the amount called on upon each share to R75. The Directors propose the opening up of 40 acres of land with rubber, which will be brought up for discussion at the general meeting.

Borjan Tea Company (Limited).—The report for 1898 states that the crop for the season was 155,283 lbs., and the average price obtained was 9d. per lb. The extensions made since last report to 31st December, 1898, amount to 103 acres, since when some 20 acres more have been put out, and the balance, making up the total area under plant to 600 acres, will probably all be out in another month, thus making a total extension of about 240 acres. The total outlay on this account to 31st December, 1898, has been £3 752, to meet which 2,000 new preference shares have been issued. The result of the season's working shows a net profit, after deducting the manager's commission, of £1,003. Adding amount brought forward after adjustments of 1896, £18, and deducting interim dividends of 3½ per cent. on the preference shares and 2 per cent. on the ordinary shares, £351, there is a balance of £670. This balance the directors recommend should be disposed of as follows:—Final dividend of 3½ per cent. on the preference shares, less income-tax, £137; final dividend of 4 per cent. on the ordinary shares, free of income-tax, £480, leaving a balance to be carried forward of £53.

Priory Tea and Coffee Company (Limited).—The report states that the trade done by the Company for the past year has been satisfactory and progressive. The profit is £4,777, from which has to be deducted the following amounts:—Managing director's remuneration and directors' fees, £650; depreciation of leasehold buildings, plant, fixtures, horses, carts, and effects, £103; interim dividend paid November last, less income-tax, on preference shares, £190; capital reserve account, being amount earned prior to incorporation of Company (26th April, 1898), £1,077, making together £2,020, and leaving an available balance of £2,758. The directors recommend that this should be appropriated as follows:—To pay the dividend of 5½ per cent. per annum for the past half-year on the preference shares, less tax, £278; to pay a dividend of 6 per cent. per annum on the ordinary shares for the period ended 6th May, less tax, £1,509; to write off goodwill, £750; and to carry forward to next account £221. The sum of £1,077, being profit from 1st January, 1898, to 26th April, 1898, the date of the incorporation of the Company (less the interest on purchase price during the period, £513), has been carried to capital reserve account.

Tower Tea (Limited).—Mr. T. Lough, M. P., presided at the third ordinary meeting. He stated that the value at which the premises, plant, &c., were taken was considerably less than it was last year, although over £1,000 had been spent on the item, and the outfit of the Company was more complete than it had ever been before. In the past three years £4,000 had been provided to meet depreciation. In connection with plant and premises he might mention that since the accounts were prepared a sale had been effected of a warehouse which was not used by the Company, and this would enable a reduction of £4,000 to be made in this item. During the current year no serious expenditure was contemplated. The reserve fund

now stood at £5,317. The consumption of the three articles dealt in by the Company—tea, coffee and cocoa—continued to increase. The demand in England during the season 1898-99 for Indian and Ceylon teas exceeded the supply by 3,750,000 pounds, but estimates already to hand with respect to next year's crop enabled them to anticipate that the temporary scarcity of lower-grade teas would soon pass away. The amalgamation contemplated when their undertaking was formed had now been completely effected, and he trusted that this step would result in securing a continuance of the prosperity which had attended the Company for many years. He moved the payment of a dividend of 11½d. per ordinary share, making, with the interim distribution of 7½d. already paid, a total dividend at the rate of 8 per cent. per annum.

The Bogawantalawa District Tea Company, Ld.—This Company has declared a final dividend of 5 per cent., which, withthe 2½ per cent. *ad interim*, makes 7½ per cent. for the year onordinary shares. [The dividend in 1897 was 6 per cent.]

The Dimbula Valley Co.—The Dimbula Valley (Ceylon) Tea Company has made a gross profit on the year of £16,783. The preference shares get 6 %; and the ordinary shares 10 % for the year. £500 is placed to reserve; and £716 is carried forward. The average price realised for the Co's. tea was 10d., against 8d. in 1897.

Mungledye Tea Co., Ld.—Crop 390,984 lbs.; average price 9 5/16d. Profit £1,434-3-6.

British Indian Tea Co., Ld.—Outturn 741,640 lbs.; average price 6.89d. Loss £1,913-13-4.

Jokai Tea Co.—A final dividend of 6 per cent., making 10 per cent. for season 1898, has been declared.

Moran Tea Co.—Outturn 459,251 lbs.; average 11.57d. The balance at credit of profit and loss to 31st December, after paying the *ad-interim* dividend in December, 1898, of £1,275, leaves a net balance of £1,073 17s. Acting under the special resolution passed on the 22nd September, 1898, the capital of the Company has been reduced to £25,500, making the shares, £4 5s., fully paid.

CAMPHOR CULTIVATION IN CEYLON.

A correspondent of the *B. & C. Druggist* reports that extensive experiments in camphor cultivation are being made in Ceylon, and as it is hoped to make the exportation of the stearoptene one of the staple industries of the island, extensive orders for distillation apparatus have been entrusted to an English firm. It is thought that the result of the experiments may considerably modify our present views with regard to the best time to extract the stearoptene from the wood. The paper itself does not accept the above statement as unreservedly as it did the assertion that "Roses of all varieties grow readily all over India," suggesting that Attar of Roses might be profitably manufactured in any part of the country. It remarks:—Is camphor going to repeat on a small scale and on broad lines the history of cinchona? This question is suggested by the news that has been arriving recently from Ceylon regarding the successful cultivation of camphor trees in the island. One of our Indian correspondents this week says on a previous page that operations have now gone so far that extensive orders for stills have been placed with British houses. We are afraid he has been a little misled as to the size of these orders. Our belief is that, so far, little more has been done than to send for distilling apparatus for experimental purposes, but on this question of exactly how far planters have proceeded we are daily expecting more information. Meanwhile we may observe that new attempts at camphor-tree cultivation make themselves much sooner felt than do similar steps in the case of cinchona, with which we have suggested a parallel. In the Government gardens at Hakgala in Ceylon the cuttings that have been planted two years have been found at the end of that period to be vigorous trees, and the superintendent of the gardens has found, says the *Times of Ceylon*, that the twigs and leaves are as full of camphor as the maturer parts of the trees. It is at these gardens that the officials are anxious to make distillation experiments, and from them that the planters have been supplied with cuttings of the camphor trees.

These proceedings come at an appropriate time. With the talk of Government monopoly of the present sources of camphor a very favourable opportunity for entering the market seems to be offered to new sources of supply. There is also the further possibility to be considered—one that is important and establishes another analogy with cinchona—that by scientific cultivation and distillation a much larger yield of camphor from the tree may be obtained than has been the case in Japan and Formosa. It is probable, too, that the last step in the history of bark and quinine may come very much sooner in that of camphor trees and refined camphor. We mean that the manufacture of the fine product at the seat of production from the crude substance may be taken up early in the connection of East India with camphor. It would be a much easier thing for a factory abroad to turn out a refined camphor that is almost indistinguishable from the best English make than it is to do the same thing in the manufacture of quinine. Japan has been very successful in selling her refined camphor in the United States against American and European makes, and we may see Ceylon making similar progress in this country before many years have passed.

The question here arises whether there will be a sufficiently extended use for the extra supply of camphor that may thus come forward. On this score we do not think there is much ground for fear, if the cultivation of the camphor tree is really going to work a revolution in the price of camphor at all comparable with that in quinine. A considerable cheapening of camphor would have much more effect in increasing the use of this article than a similar process had on the consumption of quinine, for camphor would then become a powerful rival of some of the cheaper vermifuges and disinfectants. But this is all speculation until we hear more of what Ceylon planters are doing and can do. Perhaps even yet the synthetic production of camphor may forestall them in the matter of price.

DISTRICT ASSOCIATIONS.

NORTH MYSORE.

PROCEEDINGS of the Annual General Meeting of the "North Mysore Native Planters' Association" held at the Chickmagalur Club on the 1st of June, 1899.

PRESENT:—M.R Ry. C. Veerathe Gowda, *President*, in the Chair, C. Vasudeva Rao, *Honorary Secretary*, also C. Sreenivasa Rao, S. U. Chokanna, B. Ranganna, K. Hanumantha Rao, N. Shama Rao, T. Puppanna Shetty, Abdul Khader, Sivaji Ramachandra Rao, Veerabhadrappa, M. Ganesh Rao, P. Jagannatha Rao, and C. Jaffer Sahib.

After the notice calling the meeting was read, the Honorary Secretary announced his report as follows:—

GENTLEMEN,—I have much pleasure to say that the coffee crop last year has been pretty satisfactory—at any rate better than the past two crops; but, unfortunately, the prices have fallen off so low as Rs 8, and even less, in cases where small quantities were presented for sale. From the reports we have been hearing, I regret to tell you, Gentlemen, that a large quantity of coffee will be put in London and other markets for some time to come, and consequently there will not be any rise in the value of our coffee. But there is one hope for Mysore coffee, which is, that it has been fetching good prices if the bean is bold and of good color, and some of our neighbouring planters have, I am glad to say, got very good prices in the London market. We have to congratulate ourselves that the "leaf-disease" and "borer" have not been doing so much havoc as they did during the last two seasons. With a little more care to shade and good cultivation, we might soon get rid of the pest. The standing crop this year is fair, although there is some failure here and there on account of the rain falling heavily on the blossom.

Plague.—Our best thanks are due to our popular Deputy Commissioner Mr. Carr, for keeping the dire disease out of the district by his strict, popular and vigilant measures.

Labour Law.—The resolution of the Government of India on the Labour law in question has been sent to us by the Secretary to the U. P. A. S. I., which I have laid on the table for your information and perusal. I think we can put our trust in the U. P. A. S. I., which will do its best to get as good a law as possible.

Roads.—The Bababudan road is nearing completion, and I hope it will be opened for the traffic from Lingadhally side to Chickmagalur next year. The roads generally in this district have been tidy and in good repair.

Railway.—I regret to say that Messrs. Sreenivasa Rao and Veerathe Gowda have not as yet sent the statistics of traffic between Kadur and Chickmagalur, which they promised to collect to

enable me to request the Government to give their best consideration to open a Railway line from Kadur to Chickmagalur and on to Hassan. Our benign Government will, I hope, think of opening a line in this part of the Malnad and give us an easy and cheap transit for the produce of this part of the country. *To illustrate*:—We grow a large quantity of lime which simply rots owing to there being no transport. We can produce plantains (banana of all kinds) and export in large quantities which, if preserved, can be stored up and used in times of scarcity; and there are many other products which can be grown with profit if there is an easy and cheap transit.

Medical.—The European planters at Manjerabad have proposed, in their annual general meeting, that "the matter of European Doctor in Chickmagalur should be taken up as soon as the authorities are less occupied with Plague." It would be much better for them if they request the Government to give them one for themselves. But as there is a very large number of natives, solely depending upon the local Hospitals and the Civil Surgeon, it will be a very great hardship to the people in the district if the present arrangement is disturbed. Indigenous medical men have died out after the advent of native gentlemen to the Medical Department The difficulties experienced in not having a doctor of our own kind are the same both for Europeans and us. I hope the Government will not disturb the present arrangement, but grant a European doctor, in addition, to meet their requirements.

Accounts.—It will be seen from the accounts on the table that only a small balance is at our credit. It is hoped that the members will show more regularity in the payment of their periodical subscriptions

Four copies of Mr. Cameron's "Report on the Prevention of Leaf-disease in Coorg" were kindly sent to us by Mr. B. K. Vencatvaradiengar, our Deputy Commissioner, and they are under circulation.

Attigundi.—I am glad to inform you that on the 24th April, the new *Santhe* was opened at Attigundi. Mr. Sreenivasiengar, the In-Charge Deputy Commissioner, and the Amildar Mr. Ramaswamiah having been present on the occasion. This was a long-felt want and our best thanks are due to the Government.

Agricultural Chemist.—This officer, recently nominated by our Government, visited some of our estates during his last tour in the district, and I hope he will be a source of great help to our industry.

With the above retrospect of the year, I have great pleasure in laying before you the accounts of the current year. In conclusion I have to say that the President and myself have tendered our resignations and I must ask you to elect office-bearers for the next year.

PROCEEDINGS.

I. Proposed by Mr. Ranganna, and seconded by Mr. Hanumantha Rao, that the Report and Account be accepted and passed with a vote of thanks to the President and Secretary, and that they be requested to again accept the offices for the coming year. Carried *nem. con.*, they agreeing.

II. Proposed by Mr. Sreenivasa Rao, and seconded by Mr. Jagannatha Rao, that the Government be addressed to establish an Hospital at Attigundi.

III. Proposed by Mr. Chokanna, and seconded by Mr. Puppanna Shetty. that a request be made to Government to appoint one of our members to represent us at the Local Fund Board.

IV. Proposed by Mr. Ganesh Rao, and seconded by Mr. Chokanna, that the Government be moved to ask Mr. Cameron, Superintendent, Government Botanical Gardens, to visit the Coffee District of Mysore, at his earliest convenience, and furnish a report on the Coffee industry, &c., here as was done with Coorg.

V. Proposed by Mr. Abdul Khader, and seconded by Mr. Sreenivasa Rao. that the Government be requested to open a road to Pandravalli, as graciously promised by our late lamented Highness Sri Chamarajendra Wodayar Bahadoor during his last tour in 1885-86, after the completion of the Bababudan Hill road.

Before the close of the meeting, Mr. Sreenivasa Rao, in reply to the Honorary Secretary's remarks *re* Statistics for Railway, stated that, owing to the prevalance of plague, he did not think it advisable to press upon local authorities to address the Government on the subject, and promised to do so soon. After a vote of thanks to the Chair, the meeting terminated.

C. VASUDEV ROW,
Honorary Secretary.

KANAN DEVAN.

Annual General Meeting held at Munaar, 3rd June, 1899.

PRESENT. Messrs. J. A. Hunter, G. Nicoll Thomson, W. M. Taylor, A. Angus, A. H. Mead, Dr. Kerr (*Honorary Member*), L. Davidson, E. Harley, and C. Burn Murdoch.

Mr. Mead was elected to the Chair.

The minutes of last meeting were then read and passed.

Office Bearers.—The following office-bearers were elected for the year *President*—L. Davidson, Esq., *Honorary Secretary*, C. Burn Murdoch, Esq. *Committee*—H. M. Knight, Esq., W. D. Martin, Esq., W. R. G. Hickey, Esq., Ralph Hedger, Esq., T. W. Schmid, Esq., M. S. Milne, Esq., A. Angus, Esq., T. A. Hunter, Esq., and G. N. Thomson, Esq.

Cardamom Leases.—Proposed from the Chair that copies of the old and proposed cardamom leases be sent round to the members interested for suggestions, and that the Committee meet and frame a letter to Mr. H. M. Knight, and that he be thanked for the trouble he has taken in the matter.

Sanitary Condition of Bodinayakanur.—Proposed from the Chair that His Excellency the Governor of Madras be thanked for the steps he took last year to improve the sanitation of Bodinayakanur and be informed that, in the opinion of Dr. Kerr, the direct result has been the stamping out of the cholera, and that whereas there were hundreds of deaths from this cause at this time last year there has been an entire absence of the disease since the cleansing of the town.

Roads—Western Outlet.—Proposed by Mr. Mead, that the Travancore Government be communicated with on this urgent work. That it be pointed out to Government that the road is an Imperial mail road connecting an important district with head-quarters, and is of the same class as the Peermaad Ghât road and the Anamalla Ghât Road in British India, the latter now in course of construction although the district is only in its infancy. Seconded by Mr. A. Angus and *carried*.

District Roads.—Proposed by Mr. W. M. Taylor that the Honorary Secretary be instructed to address the Madura Local Fund Board and the Travancore Government, P. W. D., with a view to having the votes for the minor roads for the district increased, as the amount at present allowed is inadequate, owing to the greatly increased traffic. Seconded by Mr. G. H. Thomson and *carried*.

Medical.—Proposed by Mr. G. Nicoll Thomson, that the Honorary Secretary call the attention of the Travancore Government to the fact that not only have they failed to pay the grant-in-aid for the past year, but also that their own medical staff is insufficient necessitating repeated appeals to the planters for the loan of their own private apothecaries, one case in point being, when the Government apothecary was absent in the low country on Government business and no substitute provided, a planter's apothecary was requisitioned in a murder case taken a 600 mile journey and is now stranded at Parur without any means to bring him back to his station. Seconded by Mr. A. Angus and *carried*.

Labour.—In this connection the Honorary Secretary was instructed to send round circulars inviting opinion on two proposals with reference to coolies who have left one estate with their account not settled up and receiving advances in their village and going up to another estate in the same district.

Proposed by Mr. Mead, that no manager take on a kangany without previously corresponding with the said kangany's former employer. Seconded by Mr. C. Burn Murdoch and *carried*.

Game Laws.—Proposed by Mr. Harley, that a Rs.10 game license be imposed and that the proceeds of such licenses be expended on a Rs.10 reward per head for jungle dogs, which pests are rapidly exterminating the game on these hills. Seconded by Mr. C. Burn Murdoch and *carried*.

Proposed by Mr. A. H. Mead, that it be pointed out to Government that the close season for bison and ibex and most of the feathered game has been drawn up under a misapprehension of their breeding times, and that Messrs. Harley and Burn Murdoch be appointed to draw up a table showing the breeding times of all game, and that the Government be asked to modify the close season according thereto. Seconded by Mr. T. A. Hunter.

Delegate.—For the annual meeting of the U. P. A. S. I., Mr. H. M. Knight was appointed delegate, and a sum of Rs.100 voted for his expenses.

Annual Report of Committee.

In presenting the Annual Report, the Committee congratulate you on the absence of cholera from the district, largely due, they believe, to the steps taken by His Excellency the Governor of Madras to improve the sanitary condition of Bodinayakanur

The success of last year's planting in the district, coupled with improved prices both for tea and cinchona, make the outlook for the future satisfactory. Coffee prices are unfortunately low, but crops all round have been exceptionally good this year.

The absence of the Chairman on a well deserved holiday and the departure of the Secretary, Mr. Sharp, to another district leave blanks in the Association, which are felt by all.

The improvements in Post and Telegraph service are greatly appreciated, and it is to be hoped that the improved postal facilities between these hills and Madras may very shortly be extended to Ceylon.

The Committee regret that the inadequate medical grant of the past was entirely withdrawn last year, but trust and believe that this district will be put on an equal footing with the other districts in His Highness' territory in the near future.

The Committee regret that, while all other South Indian planting districts have had or are having cart-roads cut to them, the prospects of a cart-road to this district are no nearer than they were a year ago.

Your Committee are thankful that plague has practically disappeared from Southern India.

Your Committee are also thankful to see that the Government of India have under consideration a labour ordinance, which will meet the requirements of planters and also give some security for advances in the future.

There has been an abundance of labour in your district during the past year, and now, with better facilities for procuring foodstuffs, there seems every likelihood that this satisfactory state of affairs will continue. Another marked feature with regard to the labour-supply is the increased number of old Ceylon trained coolies now coming in from their villages to work on these hills for small advances of under Rs.10 per head. These coolies, to a young district with a large acreage of tea coming into bearing necessitating trained factory hands, will be very acceptable. This result has undoubtedly been partly brought about by the recent gratuitous advertisements in the Ceylon papers, for which the Committee desire to thank those who are responsible.

The proceedings then closed with a vote of thanks to the Chair.

C. BURN MURDOCH,
Honorary Secretary.

MARKET REPORT.

By Mail Advices of 9th June 1899.

COFFEE.

The *London Commercial Record* says:—Continued flatness prevails and a large proportion of the supplies at auction had to be withdrawn for want of adequate offers. Only about one-third of the East India was disposed of, chiefly Mysore, and for desirable quality fairly steady prices were paid, but the bulk presented little attraction to buyers and was not sold. Home trade grades of Costa Rica met with fair competition, but the less desirable samples were only partly disposed of at lower prices. There was very little demand for Guatemala, which was chiefly bought in. "Futures" have been quiet, and prices are again easier, closing as follows:—

London	Santos	Sept delivery	28s.
New York	No. 7 Rio	„ „	4·95 cents.
Hamburg	Santos	„ „	28½ pf.
Havre	Santos	„ „	34¼ francs.
Holland	Good ordinary Java		27¾ cents.

Imports, Deliveries and Stock of Coffee in London are as follows:—

In the Imports an increase this year of	1,474	tons.
Home Consumption an increase of	679	„
Export a decrease of ...	1,135	„
Stock an increase of	6,467	„

The week's auctions have gone off as follows:—

Ceylon.—*Plantation.*—8 casks 3 tierces 5 barrels 2 bags sold—smalls 50s, low middling to middling 84s to 94s 6d, bold 94s to 100s, pea-berry 96s to 97s.

East India.—4,402 bags partly sold as follows: *Mysore*, smalls 38s to 55s, middling grayish 60s, good middling colory 70s 6d to 77s 6d, good to fine bold blue 88s 6d to 98s 6d, pea-berry 94s to 97s. *Coorg*, smalls 36s to 48s 6d, middling dull to good middling 61s to 71s 6d, good to fine bold blue 76s 6d to 91s 6d, pea-berry 75s to 104s. *Neilgherry*, smalls 47s 6d, middling 60s, bold greenish foxy 64s, good dull colory 75s, pea-berry 70s. *Wynaad*, smalls 38s, low middling pale grayish 40s. *Nelliampathy*, smalls 36s.

Jamaica.—Of 435 bags offered a small part sold, fine ordinary greenish 39s, good to fine blue 57s 6d to 75s 6d, fine middling 91s 6d to 92s, fine bold 104s 6d to 106s, pea-berry 92s.

Costa Rica.—5,007 bags about half sold, small 38s to 41s 6d, good to fine ordinary brownish 37s to 44s 6d, low middling 46s to 51s 6d, middling to good middling colory 56s to 72s, fine middling blue 74s 6d to 75s, good bold 77s to 88s, pea-berry 50s to 89s.

Guatemala.—3,113 bags offered, about 400 bags sold, smalls 35s to 36s 6d, fine ordinary greenish foxy 41s to 42s 6d, fine fine ordinary 44s, middling bright grayish 55s, pea-berry 45s to 64s 6d.

Nicaragua.—548 bags partly sold, smalls 36, fine to fine fine ordinary 42s to 44s, low middling to middling colory 47s 6d to 50s, good middling 59s 6d, good to fine bold and extra bold 86s to 109s, pea-berry 53s 6d to 95s.

Salvador.—3,447 bags half sold, fine ordinary foxy greenish 35s to 35s 6d, fine fine ordinary 44s, low middling colory 45s to 45s 6d, middling 52s, bold pale greenish 61s, pea-berry 61s to 73s.

Coban.—161 bags sold, good middling hard blue 73s 6d to 76s 6d, pea-berry 64s to 93s 6d.

Vera Paz.—574 bags partly sold, smalls 41s 6d, good middling greenish colory 68s, bold good blue 84s, pea-berry 85s 6d.

Colombian.—1,420 bags partly sold, ordinary greenish 27s to 30s 6d, low middling blue 45s to 54s, good bold 66s 6d, pea-berry 63s 6d.

Mexican.—1,162 bags partly sold, smalls 28s 6d to 35s 6d, fine ordinary greenish 41s, fine middling blue 70s to 71s, fine bold blue 90s.

Ecuador.—199 bags bought in.

Porto Rico.—44 bags withdrawn.

Offerings at auction to-day consisted principally of 2,797 bags Costa Rica, 2,483 bags Guatemala, 102 bags Columbian, 720 bags Salvador, and 1,008 bags New Granada, &c. The auctions went off flatly and a large proportion was bought in. The small quantity sold embraced some common Costa Rica which was quitted in buyer's favor.

Receipts in Rio and Santos.

	1898-9.	1897-8.	1896-7.	1895-6.
Since July 1	Bags.	Bags.	Bags.	Bags

TEA.

Indian. The sales were larger, comprising 14,300 packages, of which 1,050 were New Season's, contrasted with 7,900 packages (281 New Season's) in the preceding week and 9,500 packages (473 New Season's) a year ago.

For the 1899 crop, which did not present a very attractive assortment, there was fair competition, though a comparatively low range of prices was established, the result for the 1,000 packages sold on garden account being 7¾d per lb. Last year's growth was taken up at firm rates for all grades below 8d per lb., but for others the enquiry was somewhat limited.

Ceylon.—Public auctions were much heavier, totalling 34,400 packages against 25,000 packages in the week before and 20,800 packages at this time in 1898. Common to fair Pekóe Souchongs were steady, very few being obtainable under 7d per lb., but Pekoes in many invoices sold easier, often only bringing the same as the former, while the better lines continued to be neglected. Broken Pekoes ruled with considerable irregularity, a few lots possessing special point showing a slight upward tendency, while the less desirable parcels favoured buyers. Finest lines were in small supply and marked little alteration in value.

The average is 7¾d per lb. On the 1st inst., it stood at 8d per lb. and 7¾d per lb. in 1898.

Java.—Catalogues contained 327 packages of direct import which passed generally at about former quotations Nearly 3,300 packages are advertised for the 12th and 19th instant.

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns, were:—

From 1st to 6th June, 1899	2,868,434 lbs.
,, ,, 1898	2,911,011 ,,

During the fortnight the following have been printed for sale by public auction:—

	Sold.	Withdrawn	Total offered.
	Pkgs.	Pkgs.	Pkgs.
India	11,543	2,736	14,279
Ceylon	31,685	2,749	34,434
Java	212	115	327
Total ...	43,440	5,600	49,040

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated June 9th, 1899, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1st June to date.

	Indian.	Ceylon.	Java.
1899-1900 ...	16,063 pkgs.	35,180 pkgs.	327 pkgs.
1898-1899 ...	10,500 ,,	21,902 ,,	1,912 ,,

15,658 pkgs. Indian
35,180 ,, Ceylon
327 ,, Java
} Total 51,165 packages were offered in public auction this week.

The movements of Tea in London for the whole of the past season are given below; the total supply from India was very little above the previous season, while the deliveries were 13 millions heavier. Ceylon sent rather less Tea-but a falling off took place in the deliveries.

Indian. Teas up to 7½d showed a strong market, but medium descriptions sold irregularly with a rather cheaper tendency. The 1,105 pkgs. of New Season's Tea in auction were, on the whole, somewhat poor. The official wire gives exports to U. K. for 2nd half of May as 2,710,000 lbs., against 1,600,000 lbs same period last year; 1st April to 31st May, 5,702,000 lbs. against 2,707,000 lbs. 1898

Week's av. of New Season's Tea sold on Garden Account 1899, 1,055 pkgs., av. 7·83d. 1898, 1·950 pkgs., av. 7·27d.

New Season's Tea sold on Garden Account 1st June to date 1899, 1,121 pkgs., av. 7·85d. 1898, 1·950 pkgs., av. 7·27d.

Ceylon. The heavy auction was doubtless partly occasioned by the accumulation of Teas during Whitsuntide; the chief demand was for Teas up to 7d. per lb., anything over this price selling with irregularity and showing a weaker market. Average for week 7·73d., against 7·70d. same period 1898.

Ceylon Tea sold on Garden Account, 1st January to date 1899, 455,057 pkgs., av., 8·34d. 1898, 462,171 pkgs., av., 7·65d.

Java. The few Javas brought forward were mostly sold at steady rates.

IN AMERICA.

The *American Grocer* of 24th May says:—The tea sale of last Wednesday demonstrated that the general market is firm. There was spirited bidding for Moyune and Tienkai Greens, while

Pingsueys were not so well supported. The offering of Formosa Oolong was light, and prices obtained some what irregular. Full details will be found in the regular market report.

COCOA.

The fair supply of 4,929 bags Colonial and 1,697 bags Foreign growths (together 6,626 bags) was brought to the hammer on Tuesdays, demand for which proved very poor, only about 1,600 bags selling at an irregular eecline of 1s to 3s per cwt. Of 3,309 bags Trinidad offered barely 600 bags were quitted at 69s to 73s for fine to very fine red, 64s to 67s 6d for fair to good ditto, 56s for pickings, and 40s 6d to 50s for black, shewing a reduction of 2s to 3s in values. Of 750 bags Grenada 600 bags sold at 1s to 2s decline, viz., good to fine red 64s to 66s 6d, and common to fair 50s 6d to 63s. Of 399 bags Jamaica only a lot or two sold at 62s to 63s 6d. 36 bags good to fine Demerara found buyers at 63s to 66s, being lower. 18 bags good red Tobago realised 64s to 65s. 85 bags St. Lucia, 34 bags Surinam, and 40 bags Domingo retired unsold. Of 1,621 bags Guayaquil catalogued 265 bags were placed at steady prices, except for Caraquez which gave way 1s per cwt; early Arriba brought 70s, Tumaco 66s, good red Caraquez 70s, and greyish ditto 67s. Of 332 bags Ceylon only 50 bags common Native sold at 60s per cwt. shewing some decline Private business during the week includes 150 bags Guayaquil Caraquez at 69s to 69s 6d for gray.

Import, Home Consumption, Export and Stock of Cocoa in London are as follows:—

PEPPER.

Black.—Since our last the market has been firm and dearer, but is quieter at the close. About 300 tons have been sold, principally Singapore at 5⅜d on the spot, at 5⅝d June-Aug. (s.), 5 23/32d July-Sept., and at 5¾d Aug.-Oct.

At auction on Wednesday 54 bags Mangalore sold at 8¼d to 8⅜d for fine bold shot, and 7½d for bold brown. Of 404 bags Tellicherry, 163 bags sold at 5¼d per lb. for good fair brown. 7 bags Penang and 9 bags Lampong withdrawn,

White is also firm. About 150 tons are reported sold during the week, viz.:—Singapore at 8 5/8d to 8 11/16d for fair on the spot, at 8¾d May-July (s.), at 8 15/16d for July-Sept.; Penang at 8d to 8⅛d for fair on the spot, at 8¼d June-Aug., and at 8⅜d to 8 7/16d for Sept.-Nov.

At public sale on the 7th inst. of 331 bags Singapore offered, 177 bags sold—good bold 9d. Of 19 bags fine decorticated 9 bags realised 11¼d per lb.

GINGER.

Cochin.—Of 1,317 bags 347 cases brought forward 345 bags 180 cases sold as follows:—Bold with some medium hard brownish limed, scraped, 61s, medium ditto 39s to 40s 6d, medium and small ditto 25s 6d, bold Native cut 56s, medium and bold ditto 45s, medium limed 42s, medium and small, part boldish, roughly cut and scraped, 30s, small cut 28s to 29s, medium and small washed rough 21s, washed brown small and ends 17s 6d to 18s, and cuttings 15s 6d per cwt these prices being 2s to 3s per cwt. down for cut, rough showing no changs.

Bengal.—100 bags bought in at 20s per cwt.

Japan.—60 bags retired unsold.

Jamaica.—The large supply of 1,662 barrels, &c., was brought forward, and about 1,000 barrels, &c., sold at 2s to 4s rise for the better qualities, other grades being steady. Fair to good bright plump 69s to 74s medium to good medium 65s to 67s, ordinary to good ordinary 57s 6d to 63s, Bhatoon 50s 6d to 55s.

St. Lucia.—23 bags bought in at 60s per cwt.

INDIA RUBBER.

There has been continued pressure to sell fine Para forward, and considerable sales have been made at rather lower prices. On the spot sales of 120 cases fine Bolivian at 4s, and fine Para at 4s ½d to 4s for forward delivery. Sales of hard cure fine forward at 4s ½d to 4s, and hard or soft at 4s ¼d to 3s 11⅜d. The market for fine closes steady. Negroheads in slow demand, sellers of scrappy at 3s 2d, and small sales of Island at 2s 7d. Peruvian.—Sales of good sausage at 3s 1d, also ball; slab—small sales at 2s 8d to 2s 7½d.

At auctions to-day there was very little demand and nearly all was withdrawn, only buyers at a decline in value.

Peruvian.—Dirty and foul ball sold at 2s 11d to 2s 11¼d and slab at 2s 7½d per lb.

Para.—Coarse fine sold at 3s 10d, selected virgin, &c., 3s 4¾d to 3s 6d, low earthy negroheads at 2s 7½d

Mollendo.—20 packages retired (3s 10d per lb. bid for fine).

Columbian.—60 bales offered and 29 sold, fine crinkly strips 3s 4½d to 3s 4¾d, fair strips, little heated 3s 3d, middling, a little heated 2s 11½d, very heated 2s 3d.

Mangabeira.—7 pkgs. retired (2s per lb. bid).

Madagascar sells fairly; 46 pkgs. offered and 30 sold—fair to fine East Coast niggers 2s 1½d to 2s 6½d, very earthy ditto 1s, fair to good black coated slab 2s 2d to 2s 3½d per lb.

Mozambique rather cheaper; 130 bags offered and 45 sold, good red ball 3s 5d, fair red ball 3s 4¼d, soft white ball) 2s 9¼d to 2s 10d, mixed Lamu and soft ball part unripe 2s 7d to 2s 8½d, brown niggers at 2s 8½d.

Rangoon.—20 pkgs. Penang 127 pkgs retired.

Borneo.—9 pkgs. offered and 2 sold, fair little mixed at 1s 11d per lb.

Assam.—105 pkgs. offered and part sold, mixed to good red at 2s 7d to 3s per lb.

CARDAMOMS.

Cardamoms sold with fair competition at slightly dearer rates. The following was the range of prices:—Ceylon-Mysore, fine medium to good bold pale pods, 3s 11d to 4s; good bold steady, 3s 10d; medium to bold pale, 3s 5d to 3s 6d; dull small to medium ditto 3s to 3s 3d; bold dull long pale, 3s 2d; medium lean pale, 2s 6d; pale medium long, 2s 10d to 2s 11d; small pale long, 2s to 2s 4d; long dull bleached, 2s 9d; very small lean, 1s 9d; medium dull long, 2s 2d; good splits, 2s 3d; long, lean and split, 1s 6d to 1s 9d; brown splits and pickings, 1s 8d. Ceylon-Malabar, fair to medium lean palish, 1s 11d; and small brown lean, 1s 8d; fair wild Ceylon, 2s 6d per lb. Seeds good brown, 2s 4d; mixed seeds, 2s 2d.

The shipments from Ceylon from January 1 to May 16 were 216,087 lbs.

CINCHONA.

In auction the demand was for Crown and grey bark only, which sold as follows:—Good bold pale Crown Loxa, 7½d. per lb.; 1 c. c. damages, 5½d. to 6½d.; second class, 3¾d. to 4¼d; and fourth class, 2d. Dusty grey Huanoco, broken, was bought in at 5d. and Bolivian cultivated Calisaya, thin, was limited at 10d. per lb., and Cartagena, flat, at 4½d. per lb. Four bales of flat Calisaya brought 4d. per lb. subject to approval.

The shipments from Ceylon from January 1 to May 16 were 284,371 lbs.

The stocks in first hands at Amsterdam on May 31 consisted of 2,403 packages Government and 9,896 packages private bark. The arrivals last week in Amsterdam were 2,553 packages.

The "Nederlandsche-Veem" reports the cinchona-bark shipments from Java during May at

	1899.	1898.	1897.	1896.	1895.
Amst. lbs. ...	943,000	672,000	600,000	768,000	402,700
Jan.-May ...	3,964,800	3,884,000	2,510,000	3,260.000	2,879,700

while the "Vriesseveem" received a telegram from Java announcing the shipments from May 2 to June 5 at 1,156,000 Amst. lbs., and from January 1 to June 5 at 3,848,403 Amst. lbs.

A telegram from Amsterdam, sent June 8, says:—Of the 5,456 packages offered for sale 5,084 sold at an average unit of 8·25c. per half-kilo, as compared with 8·50c. in May. The following were the approximate quantities purchased:—American and English factories, who purchased the equivalent of 5,817 kilos.; the Brunswick factory, 3,921 kilos.; the Mannheim and Amsterdam factories: 5,529 kilos.; the Frankfort-on-Main and Stuttgart factories; 3,557 kilos.; and various buyers, 3,547 kilos. The prices paid for the manufacturing-bark ranged from 7c. to 74½c. per half-kilo, and for druggists, from 11c. to 61c. per half-kilo The tone is easier.

ATTAR OF ROSE.—A telegram reached London yesterday from Bulgaria to the agent for a house there saying, "Stop selling; going up." The present price of fine brands in London is 22s. to 24s. per oz.

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged wo rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittance should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 14th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Coorg.

Polli Betta, *4th July*.—Heavy rain on 1st; light again on 2nd and 3rd. Showery weather, with intervals of sunshine. Ought to be fine weather for the nitrifying bacteria. Total rainfall to date nearly 30 inches. Fine growing and planting weather. Planting supplies in progress. Coffee looking fine. Being handled out. *Labour*—Plentiful. *Health*—Good.

ANOTHER TEA CAMPAIGN.

Tea Importers in England are determined to have the 1-lb. draft abolished; dealers are equally set upon retaining the old custom. The struggle has at last begun. Telegraphic advices state that an influential meeting of tea-growers, with Sir Henry Seymour King, M. P., in the chair, has been held for the purpose of indorsing the Report of the Joint Committee of the Indian and Ceylon Associations, and has resolved that, after the 17th instant, the 1-lb. draft allowance shall not be made to buyers. This is, we believe, the first open declaration of the intentions of tea-growers. No notice was given to "the enemy." The plans of growers and importers leaked out through the newspapers, but the gage of battle has only now been thrown down, after some weeks have been occupied in gathering forces together. Fortunately for dealers, they have not been taken by surprise, the newspapers, as we have said, having given them a hint of what was in store. Mr. T. Lough, M. P., made much of this in a recent speech on the subject, when he said that the first point he would make in entering that protest was against the secrecy of the proceedings to which they had been subjected. He himself heard nothing about the

proposed change with regard to the draft allowance until some fortnight ago,and,as soon as he heard about it, he asked for some particulars, and he found that, as early as March last, a circular had been sent out to India, and that very day, while they were meeting in Mincing-lane, as he understood it, a round robin was being sent round the hills of India and Ceylon to be signed by every grower of tea, and when the requisite support was forthcoming it would be dumped down upon the market at home, and the change which those men proposed in their own interests would be carried into effect in spite of their protests. The "dumping down" has now been effected, and dealers, far from being taken unawares, have at once accepted the challenge and resolved not to attend the sales and not to buy tea privately. It is, in effect, a lock-out.

Representing, as we do, the planting interest, we cannot but regret that all the calm, impartial discussion that has come to our notice so far has been on the side of the dealers. There is certainly a great deal in the argument of growers that, if they sell a quantity at a price, they should get the proceeds of that same quantity at that same price. But at all times there have been allowances. Here, there is a discount on price; there, a draft on quantity or weight. In olden days the first buyer was regarded,or regarded himself, as a distributor, not as a mere buyer and seller, and he accordingly arranged with the supplier in such manner as to protect himself against loss of weight in weighing out, delivering, etc., etc. Whether this be originally borne by the importer or by the first buyer, it is a charge that must eventually influence the price, not only as regards the producer but also as regards the consumer. Values are finally assessed according to the relations of these two to each other. Demand and supply are the ruling forces, and no matter what discounts or allowances or deductions may come in while the tea passes from plantation to house, things will eventually so adjust themselves that the planter only receives the actual value of his produce. In "packeting" tea, for example, there must be a loss of weight. If no tare be allowed on the chest, the packet-supplier must calculate accordingly, and his first inclination will be to offer lower prices for the teas he wishes to purchase. Dealers admit that the importer is not bound to provide a draft to pay for the leakage that takes place during the process of the distribution of the tea. They merely say that *some one* must take it into the reckoning, and they claim that they are entitled to the pound overdraft, because it is representative of an old trade custom; that the trade has been built up on the basis of the pound overdraft, and, if they consent to forego it, it will disturb the trade; it will be exceedingly difficult for them to withdraw the privilege from their customers.

From the beginning we have questioned the wisdom of the growers and importers who have raised this question. What can they hope to gain? No agitation of this kind can raise the nett price they will receive. As a matter of fact, the first result of their attempt appears to have been sadly adverse to their interest. Business in tea in London has apparently been disorganized, if not demoralised. Recent telegraphic news said "business is of the slackest kind. Prices have dropped of late something like 1d per lb." —which means much more than 1 lb. per chest! There was nothing to prove that this was not a mere natural consequence of fluctuations of supply and demand, or differences of quality, but there was room for the presumption that dealers knew their strength, and were holding off the market as much as they could until the "draft" question was settled. And now the truth of this seems beyond doubt, for purchases have been entirely stopped. If they buy only to cover immediate requirements, permitting stocks in their hands to run lower than usual, one result must be a slackness of demand and of price in the wholesale market. Importers may think that this will "come right in time;" but, in the meantime, *they* will be the losers. The onus of holding out will be thrown upon them, and should they eventually find it more than they can carry, very heavy loss may result. And even if they win, what an empty victory after all! They cannot force upon dealers any views that are not fair. They claim, justly, that the selling of actual weight at the price agreed upon between buyer and seller *is* fair. They are now met with the counter-claim that it is fair the buyer should receive what he buys—Tea, not stones, not nails, not dirt. Messrs. BROOKE, BOND & CO., LD., whose interest in the tea trade is very large, put the matter thus:—"The conflict between the importers and the buyers is really whether the three short words 'draft as usual' in the conditions of sale shall be retained or rubbed out. If the importers do get their way in abolishing the draft, the buyers must insist that clause 5 of the Conditions of Sale must, at the same time, be absolutely cancelled." This most arbitrary clause 5, reads, *verbatim*, as follows:—"No claim for difference in bulk from show or selling sample will be entertained unless notified in writing to the selling broker within three working days from the day of sale. No allowance will be made on account of any damage, rubbish, false package, or unequal goodness found, or alleged to be found, after the goods have betaken from the warehouses." If the importers gain their point, they must also make up their minds that they will be assailed daily with an infinite number of petty complaints and claims from all sorts and conditions of dealers. When they come to cast up accounts, will the profit be on their side? We think not. We assert unhesitatingly that growers and importers were ill-advised when they took this "draft" question in hand, and that,instead of benefiting themselves, even if they win, they will eventually lose money. In the meanwhile they have successfully disturbed the very pleasant relations that had been established in England between importer and retailer, and they have helped to cement the already close bond of union by which retail traders in tea are bound together.

THE FINANCING OF PLANTING OPERATIONS.

Some years ago, Baron von Rosenberg mooted a project for the establishment of a Planters' Bank, and, though this never assumed definite shape, enough was said to indicate that the Baron had German Agricultural Banks in view as models. In connection with this subject, and that of co-operation, the question suggests itself, whether the planters of Southern India, or of certain districts thereof, might not do well to try co-operation and to apply it specially to the financing of their operations. The State, like Providence, has a tendency to help those that aid themselves. In Germany, State aid is carried to an extent unknown in the British Empire, but even in Germany there is usually the underlying proviso: to secure State aid it is necessary to do one's best for one's self. Co-operative farming has been

tried with considerable success. A German agricultural expert remarks that co-operation is the German farmer's stronghold and bulwark, and he means to stand by it. "Co-operation," says our expert, "has proved to be the key to success in Germany, and has saved many farmers from ruin." There are co-operative credit banks, among other things. The banks conducted on this principle enable farmers to obtain loans on personal security only, the collective guarantee of all the members; depositors are willing enough to lend money on real estate if sufficient security is forthcoming, but to Indian planters, as to German farmers, loans on personal credit are more useful. They are often indispensable to the purchase of seed, stock, manures, tools, machinery and even for the payment of wages. All the union in Germany requires is the co-operative guarantee of the members of the Co-operative Society, a body of men of recognized standing, men, too, who are acquainted with each other and know a good deal about each other's affairs. That the system, as worked in Germany, is a sound one, seems to be proved by the fact that in February 1897 the official audit showed that of 640 banks in Wurtemberg 480 were thoroughly satisfactory, 192 were satisfactory with room for improvement, and only 7 were unsound.

Agricultural Banks, on a somewhat similar basis, have been tried in the Mysore State, and official reports of progress are encouraging. With the German and Mysorean systems before them, the planting community of Southern India might perhaps draw up a scheme for the establishment of a bank or banks that should employ their money to their advantage in time of plenty, and come to their aid in time of trouble and stress. The matter is a very important one, and well worth the attention of some of the leaders of thought and progress among planters. We feel convinced that if some such scheme could be passed to the satisfaction of Government, State aid would be assured, and this would do much to render success a certainty.

BOARD OF TRADE RETURNS—MAY.

"Increased stocks" is the watchword for May. The following figures show how general the accumulation has been, though there is no occasion for planters to be discouraged thereby, as supply and demand both have their "tides."

Cocoa (raw) continued to enlarge its boundary of supply, and, notwithstanding its expanding clearances, the stock in bond further accumulated.

In the first five months.		1899.	1898.	1897.

THE U. P. A. S. I. SECTION.

[*Under the control of the Secretary of the U. P. A. S. I. (Incorporated).*]

The U. P. A. S. I. was registered on the 3rd instant under the Indian Companies Act, and its title in future will be

THE UNITED PLANTERS' ASSOCIATION OF SOUTHERN INDIA (INCORPORATED).

Copies of the Memorandum and Articles of Association may be obtained from the Secretary.

* * *

The Indian Tea Association desires periodical and accurate statistics of Exports of Tea from Southern India. A promise has been received from one firm of statistics relating to Beypore and Calicut, and any firm that would kindly furnish the necessary figures concerning other ports of shipment would place the U. P. A. S. I. under an obligation.

* * *

The Government of India has kindly offered to place certain spare space in the Indian Imperial Court at the Paris Exhibition at the disposal of tea and coffee-planters in India, and has suggested that all should work through a Central Committee in London. The Indian Tea Association and the U. P. A. S. I. are prepared to work together, but the latter has still to prepare its plans, in regard to Coffee particularly. The matter will come up for consideration at the Annual Meeting next month. Meanwhile, planters who have had experience in such matters might confer a great boon on their fellows by suggesting ideas. These might be threshed out a little *before* the meeting, and thus a good deal of the delegates' time would be saved.

NOTES.

Coffee at the Cape. The Cape of Good Hope imported £204,470 worth of coffee from Brazil during 1898 and exported *nothing* to that country.

The Calcutta Tea Sales. At the tea sales on 30th June 8,800 packages were sold. The general quality was unattractive, a large proportion being dull; and thin liquoring teas for price, in sympathy with London, fell three to four pies in value, while an easier tone prevailed throughout the sale.

A Nitrogen Carrier. Field experiments made by the Ohio Experimental Station have resulted in a declaration that "Nitrate of Soda is apparen the most effective carrier of nitrogen in common use as a fer lizer." Further, "applying manure to the surface inste of plowing it under proved to be most advantageous."

Cocoa in Bahia. The British Consul at Bahia r ports that profits to cocoa plante in his district during 1898 must have been considerab Cocoa commanded a high value, and is far less costly th coffee to gather. He states that plantations are yea increasing, and that the crop is expected soon to beco a very important one.

Act XIII. of 1859. The *Madras Mail* states that t Mysore Government has decided levy no fresh fee for the execution in Mysore of a seco or succeeding warrant issued against one and the same pe son by British Courts under Act XIII. of 1859. It has al sanctioned three extra Police Inspectors for the coff tracts, eligible Europeans being engaged if procurable.

Brazilian Coffee. In the latest Message of the Pr sident of the Brazilian Republi reference is made to an excess of paper money that "gav rise to the most extravagant ideas as regards the supe abundance of capital, originating a spirit of speculatio that infected production itself and culminated in the eno mous and too rapid development of the coffee industr and production, making it an easy prey to speculation t the ruin of prices."

Colombo Tea Sales. At the public sales of tea a Colombo on the 28th ultimo, abou 9,842 pkgs. = 765,703 lbs. were offered, of which abou 8,506 pkgs. = 658,215 lbs. were sold. The sale opene with rather a weaker tone for common grades, but soo recovered, and prices generally closed firm at previous rates Among the finest teas in the sale were Middleton, Hig Forest, Nahavilla, and Annandale. Good invoices wer also offered from Munu Kattie, Torwood, Agra, Elbedd Mocha, and Glentilt.

Mr. H. O. Newport in Queensland. We are glad to see in the Queens land papers from time to time ver complimentary allusions to the wor done by Mr. Howard Newport, the Coffee Expert. As h went from this Presidency, it is satisfactory to note that th advice and assistance he has been able to give are highl appreciated. "The benighted Presidency" has always bee regarded as a sort of modern Nazareth, but Queensland i satisfied that she has obtained at least one "good thing" from it.

The London Tea Market. The latest cable from Messrs. Gow Wilson and Stanton to the Colomb papers is dated 29th ultimo and con tains very discouraging news. A dull tone was genera among buyers, though good liquoring Broken Pekoes wer wanted. Fair liquoring Ceylon Pekoe Souchong was quote 7d, and the average 7 1/4d. A private telegram to Colombo states :—"The market is much weaker for teas between 6d and 8d., and there is every prospect of lower prices fo common and medium grades. Imports of poor liquoring teas are heavy."

Street Dust as a Fertilizer. Careful investigations have le an Italian scientist to the conclusion that one of the most marked an

important properties of street dust, when used as a fertilizer, is its power of inducing beneficial fermentations in manure and in the soil. According to American reports, in 18 samples analysed the nitrogen varied from 0·17 to 1·18 per cent., phosphoric acid from 0·01 to 0·16 per cent., and potash from 0·09 to 0·5 per cent. "Well-selected and judiciously-used street sweepings" are said to possess considerable manurial value.

Coffee in the East. Some Eastern nations assert that a dish of coffee and a pipe of tobacco are a complete entertainment. The Persians have a proverb that coffee without tobacco is meat without salt. And still in the East of Europe, coffee is the national drink, and few entertainments are complete without it—

> And Mocha's berry from Arabia pure
> In small fine China cups came in at last;
> Gold filagree made to secure
> The hand from burning, underneath them placed.
> Cloves, cinnamon and saffron, too, were boiled
> Up with the coffee, which, I think, they spoiled.

What price present day "adulterants" after this?

Ceylon Tea Shipments for June. The *Times of Ceylon* states:—The official estimate at the beginning of the month was 10½ to 11 million lbs. which, on Friday last, we raised to 11½ million lbs., but we are sorry to hear that if the Harrison Line steamer and another vessel leave this evening, it is likely to be nearly 13 millions, as against 9,700,000 lbs. in June 1898. This is unfortunate, as it is likely to depress the home market, which is unduly sensitive to such influences. The cause of the abnormal and unexpected shipments is that three steamers with 1½ million lbs. left on June 1st instead of May 31st, while, as stated above, two steamers with large cargoes of our tea are leaving to-night.

The Rose-harvest in Bulgaria. The *Chemist and Druggist* says:—A correspondent in Bulgaria, writing to us on June 5, confirms the statement made in our last issue regarding the rose-harvest. He says that on account of the great dryness, especially in the districts of Karlovo and Brezovo, the flowering-period passed with extraordinary rapidity, and the flowers were found to be poor in the yield of otto. It is still difficult to determine whether the quality of the otto will be up to the average, but it is generally acknowledged that the amount will not exceed 74,000 Turkish ounces. As to prices, the general opinion is that on account of the demand higher values will be obtained than last year. At present, pure otto 68° F. is still selling at 21*s.* per Turkish ounce.

Ceylon and Canada. Mr. Alex. Thomson, of Messrs. Whittall & Co., Colombo, visited Toronto lately together with Mr. R. Blechynden. Speaking there of the prospects of the tea industry in Ceylon, Mr. Thomson expressed the opinion they were gradually brightening, chiefly on account of the improvement in prices. The production of tea in Ceylon this year was, he said, estimated at 125,000,000 lbs., an increase of 5,000,000 lbs. over that of last year. While it was estimated that the United Kingdom would take 3,000,000 lbs. less than last year, other countries were expected, between them, to take 8,000,000 lbs. more. Regarding the maximum quantity of the tea Ceylon was expected to yield in the years to come, Mr. Thomson said it was calculated that it would never exceed 130,000,000 lbs.

Coffee under Shade. In the course of remarks on Mr. Cameron's recent report on Coffee in Coorg, the *B. C. African Times* remarks:—It appears to us that there should be no doubt left in the minds of planters that shade is absolutely essential to success. It is proving itself every day on plantations which are now, in some parts, covered with shade. Mlanje district particularly will profit by shade as, contrary to the general opinion, Mlanje plantations are on an average among the lowest in the Protectorate, the average for example of Mr. Moir's estate being about 2,000 feet. In spite therefore of their rainfall they reap the full benefit of the October to November sun and this is still more accentuated by the western aspect of most of these estates.

The Draft Question. On this subject the *Produce Markets' Review* takes a view similar to our own. It says:—"Planters will do well to be careful to what hands they entrust their interests. What is the danger that threatens them at this moment? It is that large amalgamations, brought together regardless of cost, are compelled, in the face of all prudence, to go in for vast extensions of production in order to justify the high price given for gardens. Let the planters of India and Ceylon, with whom we have the sincerest sympathy, be convinced that, at a time of quickly-increasing production, a quarrel with the trade would be suicidal, and let them realise the effect of a combined refusal to buy their teas at auction for a few weeks. This is what persistence in the present course would lead to."

Shocking. There was one aspect of that recent gathering of the tea clans to protest against the abolition of the draft which has its humorous side. Many of those present have found tea-dealing, of course with knowledge and judgment, a fairly remunerative occupation. If fortunes have of recent years been made in tea, the gentlemen who gathered together last Wednesday week have not been left out in the cold. It was therefore worthwhile to note the shocked expression on the faces of some of these wealthy gentlemen, as they pondered over the audacity of those wicked growers and importers who were clamouring for more profit. Perhaps it was only the solemnity due to the occasion, but some of their visages suggested that, if it were an age of physical torture, something "lingering, with boiling oil in it" might be meted out to needy reformers of a well-established trade custom who desire this awful change.

Caper Tea. The following appears in the *Grocer*:—A great outcry is now being got-up about the quality of cheap tea, and the presence of dust in caper tea. A very well-informed correspondent writes with reference to the latter, "It always contains sand, but its flavour is in estimation around Worcestershire, Leicestershire, and Derbyshire. The analysts have lately made the discovery that it contains sand, but unfortunately for their cause the seller could prove that Customs duty was paid on it in the condition in which it was sold to the food inspector, and a Northern analyst had a case which was lost." A certain analyst is supposed to have been the

writer of the article which appeared in a recent public newspaper, and in which very remarkable statements were made about tea which passed the Customs, and we hope shortly to give further particulars about this matter. In the meantime it would be well to treat such articles with much caution.

Tea and Cinchona in the Nilgiris.

The *Times of Ceylon* of 3rd inst. says:—Mr. T. C. Anderson returned yesterday from Tuticorin after visiting Glen Morgan, his estate near Ootacamund, well satisfied with the condition of his property, which is 12 miles from the Madras sanitarium, and consists of tea and cinchona. The former is coming on well, while the 45,000 trees of hybrid cinchona are a valuable possession, as the bark gives 6 per cent. of quinine and fetches a shilling a pound, and the price of cinchona bark is rising steadily. As a result, it is probable that a lot of cinchona will be shortly planted on the Nilgiris, where it does so well. Mr. Anderson travelled for the first time by the Nilgiri Railway, which he describes as very comfortable, but very slow, the journey from the junction with the Madras Railway to Coonoor taking four hours, the same time as the tongas used to take. The railway is being carried on to Ootacamund, and Mr. Anderson tells us it is intended to carry it on over the ridge to the low-country beyond.

The U. P. A. S. I.

"Coffee" recently wrote to the *Madras Mail* inquiring "why does not our wonderful U. P. A. wake up to the fact that coffee is getting into a desperate state of depression, and, instead of wasting time over this Act and that Act, put its shoulder to the wheel in real earnest and represent to Government the real state of affairs?" Why does not "Coffee" attend the meetings of the U. P. A. S. I. before writing in this manner? Coffee planters have ample opportunities to bring their affairs up for discussion, and if they, among others, rank the Labour question and the laws affecting it among the chief matters to be considered, it is not much use for "Coffee" to "write to the papers." If District Planting Associations would discuss important questions more than they at present do, the meetings of the U. P. A. would doubtless soon gain in value and utility. The fault lies with District Associations,—in fact, with the individual planters who are members of these and yet take no active part in bringing important subjects before them for discussion.

Division of Labour, &c.

The P. A. of Ceylon and Lipton's Limited, gave the tea to the Olympians, and the *Ceylon Observer* chipped in with a card for each recipient of a present of tea, in the hope that he would take care to follow the directions:—"First fill your kettle with FRESH water; then see that it really BOILS. Next warm your TEAPOT, and put one small teasponful of tea for each cup required; then pour on the required quantity of boiling water, infuse for FIVE minutes, then pour off the tea into another teapot or cups ready for use. [Milk and sugar added according to taste.] Thus treated, CEYLON TEA will give a liquor, pure, delicious and fragrant. On no account should a second brew be obtained from the same leaves." Then "Housekeeper" writes to the *Observer* asking permission to call attention to a small omission in Mr. Kelway-Bamber's handy and useful *brochure* on the Dietetic Value of Tea? He says (4) "put the required quantity of tea into the hot tea-pot," etc.—*but* nowhere specifies "the required quantity!" the great advantage of Ceylon over China te for Australia, America and the Continent is that you nee not use so much. But an omission may be remarked eve on the part of the *Observer*, for what is meant by "one sma teaspoonful." Ideas vary on this point, and teaspoons ex hibit almost as much variety as Indian maunds.

The Draft on Tea.

We learn, says the *H. & C. Mail* that a meeting will be held nex week of the Wholesale Tea Dealers' Association and th Joint Committees of the India and Ceylon Association to discuss this question about which so much can be sai on both sides, when it is hoped that an amicable arrange ment will be made without disturbing the present relation We have no doubt the trade will accommodate themselve to the loss of the one-pound draft so long as they retain th present advantage of two turns of the scale—both in th gross and in the tare—in the weighing of which, on eac occasion, may be anything from an ounce to fifteen ounce It will, no doubt, be remembered that, some years ago, a Sir William Pink remarked at the meeting, an arrange ment was made for weighing tea more equitably to th half-pound, whichwould be fairer to the producer than th present system; but, in consequence of the opposition b the trade, the concession was no sooner made than it wa suspended. As one of the speakers who represented th retail trade remarked, the buyers were asking for the sam thing as the importer, *viz.*, "that they should have wha they paid for, neither more nor less." The case reported in another column, in which Lipton's, Limited, were th defendants, bears on this question, and is of more tha ordinary interest at the present time.

The Terms of London Public Sales.

A Home paper remarks:—A strik ing instance of the importance o looking into the present condition under which goods are offered in public sale arose recently A parcel of tea had been bought in public sale, which, o examination in the warehouse of the purchaser, was foun to be most irregular in quality, indicating that it ha never been bulked, as the purchaser had a right to expec would have been done A complaint was lodged with th seller, who replied by directing attention to the conditio of sale, that no claim could be allowed on goods after the had left the bonded warehouse. Now, it is clearly impo sible for the purchaser to inspect every package before comes out of the bonded warehouse, and the buyer ther fore took legal advice as to his means of redress. He wa advised that the condition referred to was an unreasonab one, and that he should persist in his claim. This he di and the seller very wisely consented to pay the claim with out having resort to litigation. The matter is, howeve an important one to remember, because it too frequent happens that both sides tacitly agree that the conditions public sale are absolutely binding, however harsh or u reasonable they may be. Of course, so long as they a reasonable they are binding; at the same time it must b borne in mind that the seller cannot dictate any terms h pleases, and then, when irregularities arise, shelter himse behind some unreasonable condition of purchase.

Tea at Amoy.

In his report for 1898 the Britis Consul at Amoy says that the t grown locally again fell to 1,500 piculs, and this industry,

judge from the gradual decline in previous years, seems well on the way to final extinction. This is largely due to the oppressive and vexatious system of taxation and the failure of the growers to adopt improved methods of cultivation. The re-export of Formosa tea increased from 132,000 to 140,000 piculs, whilst the total value was somewhat below the figures for last year, in spite of the considerable increase in quantity. The past year is said not to have been a good one for tea merchants, the losses falling especially upon the Chinese traders, who are said to have suffered to the extent of 500,000 dols. The imposition of a duty of 10 cents per lb. by the United States, to which most of the tea is sent, drove prices down, and the raising of the standard of quality by the same country tended still further to depress the trade. The tea trade done at Amoy is almost entirely a transhipping business, being attracted thither by the excellent accommodation for ships, in which Formosa is wholly lacking. On the acquisition by Japan of that island, it was feared that the trade would be diverted from Amoy by the improvement of the harbours in Formosa. These fears have, however, so far proved groundless, and are likely to remain so, for nothing has yet been done to make the harbours there fit for large ships, and it is doubtful whether the natural difficulties in the way of such improvement can ever be overcome.

GENERAL ARTICLES.

A TEA CESS FOR INDIA.

A Ceylon Planter writes :—

"Do you not think the time has arrived for Indian tea planters to submit to a tea cess—similar to that which is collected in Ceylon—for the purposes of a joint Indo-Ceylon tea campaign? The Indian Commissioner in America has just retired, to join a private firm, while, on the other hand, the drain on the Thirty Committee's resources from next year onward will be very heavy, owing to the necessary expenditure at the Paris Exhibition, and for the further and increased efforts that are going to be made to push our teas in Germany, Russia, and on the Continent of Europe generally. So it is about time, I think, that the past make-shift arrangement as to India's financial contribution were terminated, and the matter put on a proper business footing. Not only would it be fairer to us, but it would be of the greatest benefit to Indian planters themselves, collectively and individually. They must admit the great good that has been done by the joint efforts of India and Ceylon in many parts of the world; and, this being so, it would be only fair that they should contribute to the joint funds in proportion to the amount of Indian tea interested, and they can only do this through a Tea Cess. I am aware that an effort was made previously to secure the imposition of a Tea Cess in India, but I believe it fell through, partly owing to lack of support from Indian tea planters, and partly to official objections raised as to the difficulty of collecting the cess at so many different ports. The latter objection would not stand criticism very long, and, if the Indian planters could be united in calling for a Cess, I do not think the Indian Government would refuse it long. I also hold that the matter should be taken up *at once* by our Thirty Committee, who should courteously approach the various planting representative bodies in India, and the principal Calcutta firms, laying the matter before them and calling for their opinion and assistance. I fully believe that, if the matter were put properly, it would be adopted by our fellow-planters on the Continent, at once. The voluntary system of taxation is absurd and unjust. We tried it in Ceylon, and it collapsed very speedily in favour of the present plan, whereby everybody contributes equitably to the tea fund and a far larger amount is raised than could be done by private and spasmodic efforts. I wish you would lay the matter before the planters and get them to take it up, as I think that it is one of the greatest importance, and that no time should be lost."

TEA GARDEN AUXILIARIES.

"Novice" writes in *Indian Gardening* :—

In reference to a leader on "Coffee as a tea garden auxiliary," which appeared in your contemporary, the *Indian Planters' Gazette*, of the 3rd instant, I cannot agree with the statement therein that "where tea will grow, there will coffee grow—and grow well." If it had stated,—"Where coffee will grow, there will tea grow—and grow well," I would freely have endorsed the statement. Judging from my little experience, I would think that a soil which will grow very good tea may not be able to support the coffee bush in a healthy state at all. Then we have some tea estates in districts which are annually visited by King Frost in all his rigid austerity, and I am much afraid that coffee would succumb to him. Still, there would seem to be no doubt whatever that coffee can be grown to advantage in a great many districts in which it has never been thought of. A few years ago nothing whatever was known in South Sylhet about coffee. It is questionable if half-a-dozen planters in the whole district knew that there was such a thing in existence as the variety known as *Liberia*. Now you may hear planters talking about the merits of different varieties as if the product was a staple of the district. That coffee will grow and fruit well in South Sylhet, Cachar and Assam, where climatic conditions are favourable, is an established fact which few will feel inclined to dispute now. But to show how sudden the change of opinion has been, it may be mentioned that one of the promoters of the far-famed Dumont Coffee Company of Brazil distinctly stated about three years ago that coffee never would do in South Sylhet. In the face of events in connection with such companies, perhaps his opinion may not go for much. But still it shows how apt we are to shift the responsibility of thinking for ourselves on to others, as his expressed opinion had weight enough to prevent a great many men (myself amongst the number) from exercising their own reasoning powers.

A few South Sylhet tea-planters contemplated giving coffee a trial as a sort of small auxiliary about three years ago, but the extraordinary reports put about concerning the coffee as growing upon the Dumont estates in Brazil, knocked the idea on the head. Now, again we hear of a garden here and there having its 10 to 40 acre plot, and in a half-a-dozen years or so we may expect to see every tea garden having its 50 acres of coffee, its 10 or 20 acres of pepper, the same amount of Areca nuts (*Areca catechu*), as well as its plot of cocoanuts, and perhaps cocoa. It is said that these can all be grown profitably, and locally disposed of, and no one need grow the less tea because he is growing these as bye-products. It is gradually becoming recognised that if a tea garden manager is what he ought to be, he will be quite able in a few years' time to clear as much from his bye-products as will at least pay the European establishment, leaving the tea to pay his commission. This opinion, I believe, has been expressed by one of our oldest and most experienced planters, who, when asked why this had not been managed years ago, said that the reason was simply the want of railway communications for one thing; and, owing to prosperous times in tea, want of pressure for another. If we may judge from things as they appear, the old gentleman would not seem to be far wrong, as it is only since we have had prospects of direct railway communication with the coast, and hard times in tea, that bye-products seem to have had any serious attention.

Coffee as an auxiliary is well worthy of consideration, as there would seem no reason why the tea districts, or the whole of Bengal for that matter, should import coffee from Ceylon or elsewhere. But coffee is only one thing after all. There are many others which could be profitably grown. It is only within the last few months that black pepper has been brought forward as a likely bye-product. It is questionable if one tea-planter in a hundred knew upon what kind of plant this common and most popular spice was grown. And yet it appears that it will grow in the tea districts of South Sylhet, and has been grown largely at one time in Assam proper. We may well ask why Bengal imports all its pepper-supply when it can be grown in Assam? A still more pertinent question would be, why do Assam and Sylhet, as well as Cachar, import *their* pepper when they can grow it themselves? Strange as it may appear, there are planters in Ceylon who are under the firm belief that Areca nuts (the common *supari*e) cannot be grown in Sylhet and Cachar; and stranger still, Ceylon exports a very large

quantity, which is absorbed by the bazars of Bengal as well as Malabar.

It is difficult to imagine what may happen a few years hence, but there can be no doubt that the idea is gaining ground that tea garden managers in India are not alert enough. This idea is all the more likely to gain ground in face of the fact that young lads at home are being specially educated now with the view of their being capable of entering upon an agricultural career in Africa. I am informed that this is being insisted upon by the powers who govern the chartered and other companies in that continent. When has an Indian tea-planter ever had an education at home with the view to his becoming a tropical farmer? Perhaps objection may be taken to the term "tropical farmer." But we ought always to remember that a tea-planter is nothing more than a tropical farmer," only that he is a very bad one, and who, as a rule, can only grow one product, when his soil and climate are suitable for growing a dozen, which might very easily be the means, in a bad tea year, of determining whether his business paid or not. Then, again, if he found that any one of his bye-products held out no hopes of being remunerative, merely being an auxiliary, he can drop it with little or no loss; he cannot do so with tea. We cannot be expected to become experts at growing tropical produce all at once, but as I for one have got the straight *hukum* to make a start, I will be grateful for any hints given in your columns as to what would be most advisable to start planting 100 acres with. My land is ordinary rolling tree jungle and bamboo; in short, it is suitable tea land, but my order is not to plant in tea. I am situated within ten miles of the Assam-Bengal Railway, to which I can boat. I am writing to *Indian Gardening* for information upon bye-products, as I believe that it is devoting itself more especially to that branch of planting.

COFFEE.

"Cherra" writes to the *I. P. G.*:—

In your leader on the above, which appeared in your issue of the 3rd instant, you invite your reader's opinion on the subject. It has been well known for many years to a great many tea planters that coffee would grow, and grow well, producing a bean quite equal in quality to some of the best brands of Brazil, and superior to most of the produce of that country. A great many people are under the impression that no country has any chance with Brazil as a coffee-growing country, but, as a matter of fact, some of the most inferior coffee which is put on the London market comes from Brazil. Again, the latter is heavily handicapped in their labour. It is well within the mark when it is stated that it cost the Brazilian coffee planter ten times the amount per head it does the Indian planter, and any one who has any doubts on the matter may consult a little book published by Messrs. Ferguson of Colombo, and written by an old Ceylon coffee planter who has settled in Brazil.

Any bushes I have seen in Upper Assam or Sylhet seemed to be in perfect health, and bearing crops which it would simply be impossible to beat. I have it on the best authority that Arabian bushes have been growing in South Sylhet in the planters' bungalow compounds for the last ten years or so, and that they have been fruiting all these years. When this is the case there can be no earthly reason why they will not grow and fruit for forty years. I think the real reason that coffee has not been gone in far more is simply that, from the very start, tea has had full sway, and as it has, as a rule, proved a fairly remunerative investment hitherto, there was no special reason for the tea planter to turn his attention to anything else. There can be no doubt that if tea was wiped out of existence in Assam through any cause, that the Assam planters would be equally as capable of rising to the occasion as the Ceylon planters were when their coffee was all but annihilated by disease. As tea is not now what it used to be—and there can be no hopes whatever that it ever will be in the position it occupied 20 or 30 years ago—I think you do well when you advocate the planting of coffee, or for the matter of that anything else, as an auxiliary to tea. Even if the tea districts of Assam could grow sufficient coffee to supply the consumption of the eastern part of India it would always be something, and a very big something, as by all accounts the consumption is large and increasing.

As the Arabian variety does so well, perhaps the Liberian variety may not be worthwhile taking into consideration, more especially in view of the fact, as you have noted, that this variety is deficient in flavour. There would seem to be great diversity of opinion regarding the merits of the latter kind, as some people say that when properly cured, and, what is of equal consequence, properly made it equals, if not excels, in flavour the Arabian grown in Southern India. At any rate, it appears that this variety is capable of great improvement by judicious selection of the seed from year to year. This would be rather a big undertaking for any planter, and there would be fifty chances to one against him ever benefiting by his labour, however much posterity might do so, and planters, as a rule, are like other people—they only work for the benefit of posterity when it happens to be to their own benefit as well, but it might be otherwise in this case. I have heard objections taken to auxiliaries on account of the labour required where it is all required for the main staple There is certainly something in this argument. Still from my own actual experience there is always a certain number on a garden which have to be employed upon odd jobs, and odd jobs are not always to hand where there is nothing grown but tea. I don't think that a couple of auxiliaries would materially interfere with the labour required for the tea cultivation when we take into consideration the fact that the auxiliary in the shape of coffee or anything else is only adopted *instead* of planting more tea and adding still more to an already overstocked market.

I quite agree with you when you say that the subject appears to be well worthy of serious consideration, and shall be glad to hear other opinions on the matter. Lungla Cherra, in South Sylhet, has only been opened about two years, which is hardly good enough to form an opinion upon. But as this is the maiden crop of Arabian this year in Wanrachura, it is being looked upon, I believe, as a thorough test-year by the proprietors of that concern.

A CHAT ABOUT TEA IN AMERICA.

INTERVIEW WITH A LONDON TEA DEALER.

(By the Mincing Lane Correspondent of the Times of Ceylon.)

"I have been in the tea trade since 1877," said Mr. McEwan, Senior Partner in the London firm of McMeekin & Co., of Billiter Street, the other day, "and we control plantations in India and Ceylon."

"And I suppose, in the pursuit of your business, you have visited the East?"

"I have, and have also been to Australia and Africa, and several times to America, from which I have lately returned."

"Do you consider that the 'Tea Campaign,' more especially as it affects Ceylon tea, is progressing satisfactorily in the States?"

"No I do not. I have never approved of this so-called 'Campaign' with its parrot cry of 'capture the American market. In this country we have displaced one black tea (China) by two black teas (India and Ceylon), and in the States the same thing is going on. Does not that rather point to the success of the Thirty Committee and their work?"

"Not at all, for the increase in consumption has been due to the ordinary developments of trade. I would say, further, that much of the work done has been injudicious work. Take one point—the advertising Why put up the backs of the Japanese Government and the dealers in Japan teas by flaring posters showing the manufacture of these teas by dirty natives? You know as well as I do that the natives of India and the Tamil cooly in Ceylon, who after all, have still a good deal to do with the making of British grown teas, are much dirtier fellows than their Japanese cousins."

"And what is the effect of all this on the trade generally?"

"Well, many dealers who quite appreciate the virtues of our teas strongly resent the character of these advertisements. You remember the old story of the man and his Council: 'No case to abuse the plaintiff's attorney.' But, surely, India and Ceylon are not reduced to this. After all, it is very much a question of price. As long as our teas show good value, they will continue to gain ground in America as elsewhere; but, if prices of common teas keep at their present level, we shall lose ground in the States and in all black tea countries."

"You think then it is time to withdraw the Commissioner?"

"I would withdraw the Ceylon Commissioner; and the India Commissioner has already been withdrawn Mr Blechynden is now selling Ceylon teas in New York, as agent for Messrs Whittall and Co."

"And, what is your opinion on the subject of Green Teas?"

"On that point I am not prepared to express very definite views. I should like to know more about the cost of producing green teas in Ceylon, and whether a tea closely resembling a Formosa Oolong can be turned out."

"Would you then stop all expenditure in America?"

"No, I would spend a certain amount in judicious advertising. No one is more susceptible to advertisement than the American"

"You would also advertise more largely in Russia, I dare say?"

"I would hardly say that; you must recollect that the Russians are an illiterate people. The shop signs are mostly pictorial: if a man has a hat-shop he paints a hat above it; if a boot shop, a boot, and so on. There has been a more satisfactory expansion of trade in Russia than almost anywhere, though very little has been spent by the Thirty Committee; and this surely goes to prove the correctness of my contentions. I should prefer to give a premium for the manufacture of good teas in Ceylon. There is far too much what I may call 'objectionable' tea that comes from that island."

"Do you think that would be practicable?"

"I am told not, but it would be a good thing if it could be done And, finally, I would recommend a policy of *laissez faire* all along the line. Depend upon it, people are in the tea trade, as in others, to make money; and directly a good thing comes their way, they will take it up"

"You will find it a difficult thing, Mr. McEwan, to convince the Ceylon planter of that He does not find the tax an onerous one; and he holds that, while some of the expenditure may be open to criticism, yet, on the whole, good is done; and in this belief he rests content."

TEA, &c., COMPANIES.

San Paulo Coffee Estates Company, Ld.—Mr. H. F. Tairks, who presided at the shareholders meeting, expressed regret that the results of the year's working were by no means so satisfactory as the estimates of the agents, based upon the appearance of the plantations in the early days of the crop, had led the directors to expect. The causes which led to the falling-off in the crop were the severe drought and the shrinkage in the size of the berry. They expected the total crop to yield 115,000 arrobas, and it only yielded 87,000 arrobas, and, added to that, the price of coffee had fallen during the year. At the time the *interim* dividend was paid the directors had every reason to believe, in view of the estimates as to the amount of crop then being gathered, that the results for the year would amply justify the distribution. They had appointed Mr. Latif as manager in place of the late manager. Mr Latif had had a large experience in coffee-planting in Brazil. The estates were in admirable order, and he believed the preference dividend of 7 per cent. would be paid at no distant date.

Tower Tea.—A balance dividend of 11½d. per share is announced, making a total of 8 per cent. for the year ended March last.

Empire of India and Ceylon Tea.—The directors, in their report for the year 1898, regret that the result for 1898 was unsatisfactory. The weather was, on the whole, unfavourable. Exchange advanced from 1s. $3\frac{9}{32}$d. to 1s. $4\frac{1}{32}$d, which reduced profits by £4,000. On some of the company's gardens there was a mismanagement and a neglect on the part of the members of the staff, which undoubtedly contributed to the failure of the year's results. Mr. George Moore, a director of the company, who has had a long and successful experience in tea-planting, went out to India in last November, and has spent nearly six months on the company's Assam gardens, investigating the system of working, and carrying out reforms While bearing testimony to excellent work on some of the properties, Mr. Moore felt constrained to replace the managers of three of the company's gardens by more efficient men. Including the amount brought forward from last year of £143, the available profit is £20,084. The board recommend the payment of the preference dividend of £10,950, and a dividend on the ordinary shares of 4¼ per cent. per annum, which will absorb £8,988, leaving a balance of £145 to be carried forward.

Rajmai Tea—The report for the year ended December 31st last states that the past season's working shows satisfactory result. The outturn of tea totalled 726,609 lbs. at 10d. against 693,853 lbs. at $9\frac{3}{16}$d in 1897. The expenditure on all divisions shows a considerable reduction, which has been effected without any sacrifice of efficiency in working. The revenue amounted to £36,998 and the expenditure to £24,480; deducting commission to managers, £1,037, there is a balance carried to revenue account of £11,480. After payment on December 14th last of the *ad interim* dividend of 5 per cent. this account shows a balance at credit of £16,657. Out of this amount the board have placed the sums of £10,000 to working capital account and £3,500 to reserve fund for equalising dividends. This leaves a balance still at credit of £3,157, from which the declaration of a final dividend of 5 per cent. is recommended, making 10 per cent. for the year, the balance £357 to be carried forward. The estimated production of tea for the current season is 756,000 lbs.

Charáwar Tea.—The working of the past season, though more favourable than that of the previous one, was, on the whole, disappointing. The actual production was 207,957 lbs. The quality of the season's manufacture was, on the whole, satisfactory, as, though the market was for the greater part of last year the lowest on record, the company's teas realised an average of $10\frac{3}{16}$d. per lb. The revenue amounted to £9,154 and the expenditure to £8,150. Deducting manager's commission (£100), there is a balance to profit and loss account of £903. After paying the preference dividend on season 1897 there remains a balance at credit of £1,890. The directors recommend that out of the balance now available £1,500 be placed to a working capital account, a dividend of 6 per cent. on the preference shares be declared, and that the balance, £90, be carried forward. The estimates for the current year are for a crop of 260,000 lbs. of tea and 60 maunds of tea seed.

Tingri Tea Company (Ltd)—The report for the year 1898 states that the season was favourable for the production of leaf and the estimated crop was slightly exceeded, but the quality of the tea was disappointing, and this, combined with the very depressed market for the greater part of last year, resulted in an average price of only $9\frac{7}{8}$d. per pound being obtained, as compared with 1s. $0\frac{7}{16}$d. for the crop of the previous season. The demand for tea seed was very limited last year, and £820 only was realised from this product. The working of the past season has resulted in a surplus of £2,804, which having been carried to revenue account, shows a balance of £3,580 at credit of that account. The directors recommend the declaration of a dividend of 5 per cent., leaving a balance of £755 to be carried forward. The manager reports the bushes have been attacked by blights, which spread greatly during the past season. The estimates for the current year are for a crop of 560,000 lbs. of tea.

TEA FROM SOUTH AFRICA

A correspondent of the *Grocer* writes:—Very few of your readers have probably yet seen and tasted a sample of Natal tea, yet, if reports are anything to go by, this variety of tea will soon be definitely upon the market.

For many years it has been pointed out that it is quite as possible to grow good tea in Natal as it is in India, China, and Ceylon. Indeed, it is claimed that the climatic advantages of Natal point it out most conspicuously as a region where tea-planting should be profitably exploited. In spite of many difficulties and much cold water that has been thrown upon it, the project of tea-planting in Natal is now an accomplished fact, and we may certainly expect to find some important consignments appearing upon the market before very long.

Mr C. E. Sage recently gave the results of some analyses which he has been conducting upon some authentic samples of Natal tea which have come into his hands from some of the leading planters in South Africa. These results are as follows:—

Sample—	1	2	3	4	5
	p. cent.	p. cent.	p. cent.	p. cent.	p. cent.
Caffeine	2·95	2·78	3 34	2·94	3·08
Tannin	8·01	10·08	10·07	8·09	6·07
Vegetable extractive matter	24·61	23·54	19·32	24·91	22·62
Inorganic extractive matter	4·24	4·45	4·95	4·46	4 38
Total extracted by water	39 90	41·57	38·31	41·21	36·78
Moisture	8 19	7 95	9 19	9·36	9 57
Ash	5·30	5·25	5·51	5·63	5·26

These results almost explain themselves. *Caffeine* is now generally known as the essential principle of tea; it is upon the presence of this substance that an infusion of tea leaves depends for its stimulating properties. The next item in the analysis is the *tannin*. This is the substance which confers upon the tea its bitter and

astringent taste; it is the substance which is generally viewed with more or less suspicion by medical men, for it is claimed, and doubtless with full knowledge, that if a tea contains too much tannin its effect upon the gastric juices of the stomach will be harmful. Readers will carefully note the low percentage of tannin. The *vegetable extractive matter* and the *inorganic extractive matter* are terms which speak for themselves—the one is the counterpart of the other. The *total extracted by water* is another term which need not be explained in detail, so is the *moisture*; and our readers will note that these samples were particularly free from water, and therefore that when buying this substance at so much a pound they are not buying much water at this price. The only remaining item in the analysis is the *ash*, and that of course naturally means what is left over when a portion of the tea is burnt till it can be burnt no longer. The ash then represents the amount of mineral matter which tea contains.

It is a pity that the Natal planters have gone to China for the names for their teas. The samples examined by Mr. Sage were designated as follows :—No. 1, "Flowery Pekoe"; No 2, "Golden Pekoe"; No. 3, Pekoe Souchong"; No. 4, "Pekoe"; and No. 5, Broken Pekoe."

Looking at the analyses of these teas one can only say that they appear to be really first-rate. There is a due amount of caffeine present which should make them mild, yet sufficiently strong in the invigorating properties associated with "the cup which cheers but not inebriates." The low percentage of tannin should make these teas welcome to the dyspeptic, and indeed to everyone who thinks much about his digestion. In each case the percentage of tannin appears to be much lower than that which is found in samples of Indian tea. The other items in the analysis are quite normal; but when we come to the ash we find a rather unusual ingredient, for it contains a notable percentage of manganese. This is undoubtedly derived from the soil, in which manganese is fairly widely distributed. I am not aware that there is any soluble salt of manganese in the tea which could be dissolved out by the water, and if there is I do not know what the precise effect upon the system would be to anyone drinking it. So far as can be gathered the amount which would be taken in a cup of tea, if it really does dissolve, is so insignificant as to be practically without any importance whatever, and so it may be disregarded. On the other hand, if the manganese only exists in the tea leaves and is not dissolved out, then of course it has no significance whatever to the tea-drinker.

A TRADE CUSTOM OF THE TEA BUSINESS DECLARED ILLEGAL.

An important case was heard lately, at the Worship-street Police-court, before Mr. Cluer (the sitting magistrate), which may have in future the effect of entirely revolutionising the retail tea-dealing business. A summons was heard at the instance of Messrs. Brooke, Bond and Co., tea dealers, against Lipton, Limited, who, they alleged, were in the habit of selling to their customers packets of tea, representing pounds and under, which were not of full weight, the paper wrappers being included in the standard weight. Mr. Horace Avory, Q. C., and Mr. Corrie Grant appeared for the complainants, and Mr. Carson, Q. C., and Mr. Mathews for the defendant company. Mr. Avory, in opening the case, said the summons was taken under the Merchandise Marks Act, 1887. It was ascertained that the defendant company sold tea in packets which did not contain 1 lb. of tea, or the weights specified thereon. The standard weights were made up by the inclusion of the paper wrappers, or, in other words, there was less tea than the quantity represented to the purchaser. He did not think that that would be disputed by the defendants, as the system in question had been deliberately pursued. The magistrate would therefore see that the weight printed on the packets was a false trade description. A similar question had been raised against the firm of Salmon and Gluckstein in the matter of cigarettes, which it turned out had been made by machine and not by hand. The magistrate there held, and stated a case, that there was no intention to deceive the buyer or induce him to purchase goods which he would not have purchased if the description in question had been omitted from the label; but the Court of Appeal held that even that was no defence under Section 2 of this Act. He estimated that by the adoption of this system it put in the pockets of Lipton, Limited, a sum of no less than £17,000 per annum, as the complainers admitted that if they pursued the practice they would increase their profits by about £11,000 per annum.

Evidence was then called, when Mr. W. G. Mercer, a solicitor's clerk, deposed to having purchased from 37 shops belonging to the defendant company various packets of tea, which he had handed over to the inspector of weights and measures of the London Country Council.

Mr. Charles Bending, the inspector in question, stated that he had first weighed the parcels as they were handed to him; then emptied the tea out of the packets, and weighed the paper separately. The 1-lb. packet weighed 1 pound 4 drachms 9 grains gross, and the wrapper by itself weighed 7 drachms 9 grains gross, which showed the weight of the tea to be 15 ounces 13 drachms. The ½ lb. packet weighed 4 oz 20 grs., and the weight of the paper 3 drachms 4 grains, the tea thus weighing only 3 oz. 14 drachms 16 grains. The 2 oz packet showed a gross weight of 2 oz. 14 gr., the weight of the wrapper 1 drachm 11 grains, the tea amounting to 1 oz. 5 drachms 3 grains.

Mr Carson, for the defendant company, admitted that what had been done by his clients had been done deliberately. They claimed a right to do it, and until the custom was stopped they intended continuing. It was not suggested that they had committed any fraud, and now a kind of rival trader, wishing an advertisement, had thought fit to raise the question, and a conviction was sought. He contended that the practice of selling tea in packets, the paper being included in the weight, was universal; and he would submit evidence from all the more respectable firms who carried on the business of retail dealing to show that this was the case, such firms as the Home and Colonial Stores, United Kingdom Tea Company, and others. By them he would prove, he thought to the magistrate's satisfaction, that there was now a definite and well-known custom of making up packets of tea, and weighing along with the tea the wrappers in which the tea was placed, care being taken to affix a label to the packet stating the quantity, such as "quarter pound packet" That was the trade description, and, as he had said, it was the universal method of making up tea. As to the advantage which it was alleged Lipton, Limited, gained by the deficient weight, he might say that in this case the particular paper in which tea was wrapped was a preservative paper, and that the cost was nearly as much as that of the tea deficiency. The learned counsel went on to say that in the year 1892, on a case being decided, Sir Thomas Lipton, then Mr. Lipton, had taken the advice of the then Attorney-General, now the Lord Chief Justice. The Magistrate held that this opinion could not be admitted. It would be evidence as to "innocent state of mind," not that there was anything wrong being done.

Evidence for the defence was then given.

Mr. William Shaw Carmichael, Secretary of Lipton, Limited, stated that all the packets of tea were made up at their warehouse in Old-street, City-road, and when sent to their branches general instructions were given to the shopmen to sell them as packets. To his own personal knowledge that had been the custom in the trade for ten to fifteen years. He had sent one of his assistants to various other retail dealers in London to purchase packets of tea, and on examination by weight he found that they followed a similar practice—namely, that of weighing the paper with the tea. The difference caused by the weight of the paper he held was infinitesimal. He denied the statement that Lipton, Limited, pocketed £17,000 a year by the practice which they adopted, but admitted that on the whole year's transaction they might make some £2,000.

Charles Blake (general manager of the Home and Colonial Stores), Mr. James Hamilton Morthew (general manager of the United Kingdom Tea Company), Mr. William Brown Colegrove (of Levers and Fry, Limited), and Mr. Arthur Richards (of the International Tea Company) gave evidence to show that it was a universal practice in the trade to weigh the paper wrapper along with the tea.

The Magistrate, in giving his decision, said he had come to the conclusion that a false trade description had been given to the goods which had been sold, and that the defendant company was liable to be convicted under the Act. He did not think that the evidence produced to prove the custom was sufficiently satisfactory, but assuming it to be proved, he would certainly hold it was an unwise custom, contrary to public policy and contrary to the Act of Parliament. It had been clearly proved that in 1 lb. of tea there had been a deficiency of 3 drachms in the quantity, and he held the

expression "one pound packet," meant that the packet contained 1 lb. of tea. It might be maintained that the defendant acted innocently in what he did, but he took it that the meaning of "innocently" was that one acted ignorantly, that there was not an untrue description with reference to the goods, and that he acted deliberately because he believed he was within the law. The result was that the defendant company had made a certain amount of profit which it ought not to have made, and the public had lost a certain amount of tea which it ought to have received in return for its money. It was, however, satisfactory to know, in the interests of all tea merchants and the public, that this case would not stop here, but would go before judges who were, perhaps, in the habit of purchasing their own tea. He could come to no other conclusion but that it was a false description, and, being deliberate, it could not be innocent. The penalty would be £10 and 15 guineas costs.

Mr. Carson requested the magistrate to state a case for the Higher Court.

THE LONDON TEA MARKET.

The *Times of Ceylon* writes:—A correspondent very closely in touch with the London Tea Trade writes us:—

"It appears to me that, now-a-days, whenever the London market gets temporarily a few extra million pounds of tea, down it goes. Witness sales by the last mail. Common rank leaf tea sells at 7d., whilst black, even tippy, Broken Pekoes are chucked away at 7½d. *Starve* the London market! Good Heavens! it looks very much as though, what with the trade contracted into the hands of a few blenders who stifle competition, and London Agents who know nothing about tea and who care less, the unfortunate *planter* is likely to be starved out. Buck up Thirty Committee, and open up new markets, or the goose that lays the golden eggs will be ruthlessly slaughtered!

"There was a young man who started with naught,
Now informs the world Ceylon he has bought:
We backed him with glee
When he first started tea—
Alas! good intentions, what havoc they've wrought!"

CEYLON ASSOCIATION IN LONDON.

ELEVENTH ANNUAL MEETING.

The eleventh annual general meeting of members of the Ceylon Association in London was held on Monday, June 12, in the Council Room of the London Chamber of Commerce, Botolph House, Eastcheap, E. C. In the absence of the President, Lord Stanmore, Mr. H. K. Rutherford, Vice-President, took the chair.

The Chairman said: Gentlemen,—The absence of our President, Lord Stanmore, to-day is, I am sure, a matter of regret to everyone here. But it is perhaps a matter of still greater regret to his lordship himself, for, as we all have good reason to know, he takes a very keen interest in the affairs of Ceylon. (Applause.) But his absence is unavoidable, as he is on the Continent. It is therefore my duty, as Vice-President of the Association, to occupy the chair, and to present for your acceptance the report of the executive committee, the statement of accounts, and the report of the tea and produce committee for the past year. These documents have been in your hands for a considerable time, and I suppose you will accept them as read. It is a matter of gratification that the number of members of this Association continues to increase, and I think that fact alone shows that an Association, such as this is, a felt want among those in this country who are interested in Ceylon matters, whether permanently residing here or only making a temporary stay. (Hear, hear.) I think it would be as well at the present time to remind you that this Association originated in a proposal made eleven years ago by the Planters' Association of Ceylon to form a branch of their Association in the City of London. But the gentlemen who met in London to consider that proposal did not quite approve of the proposition that the new Association should be a branch of the Planters' Association, and they gave it a title more comprehensive than what would have been conveyed by terming it a branch. It was decided to name the Association the "Ceylon Association in London," and as the fundamental principle of its constitution it was laid down that it was "formed for the purpose of acting in correspondence with the public bodies in Ceylon for the protection and furtherance of the interest of the colony." Now, I make this remark because in a letter very recently received from the Planters' Association in Ceylon we have been termed "a branch of the Planters' Association in Ceylon." I think you will agree with me that we cannot accept that position. (Hear, hear.) When this Association was founded, the gentlemen who founded it, headed by the late Right Honourable Sir Wm. Gregory, laid it down distinctly that it should be perfectly independent of that body as far as its constitution was concerned. So I correct the error—which has, I believe, crept into the correspondnce now for the first time. (Hear, hear.) The functions of an Association, such as ours is, is are various. Primarily, I think, it was necessary to establish such an Association in order to provide a fixed and central place in the City of London, where all who are interested in Ceylon, and those who wish to acquire a knowledge of the colony's affairs, might be provided with the most reliable information which it is possible to obtain. At a time like the present, when the public mind is filled with thoughts of a closer alliance between the colonies and the mother country, it is essential to have such a place in the metropolis of the Empire. (Hear, hear.) We are here, also, to safeguard the commercial interests of the merchants and planters of Ceylon, and to act in harmony with the Indian Association and any other Associations of a kindred character whenever our and their interests may be common. We are also here to support any good and useful measures relating to Ceylon, or, if need be, to oppose any measures that we think may prove detrimental to the best interests of the colony. If these, then, are our objects, and while we keep them in view, I think we cannot possibly be otherwise than actuated by the same motives that govern the two public bodies in Ceylon—the Planters' Association and the Chamber of Commerce—and, I may also be permitted to add, the representative press in Ceylon. (Hear, hear.) Well then, gentlemen, if our interests are always in common, I fail to see how we can act otherwise than according to our charter, which is "for the protection and furtherance of the interests of Ceylon." (Hear, hear.) I make these remarks to-day because of the criticism offered as to the action of this Association with regard to the matter which fills up such a large portion of the Executive Committee's report which is before you. I have no intention whatever of opening up a discussion on the Northern Railway, as the question of its desirability, its gauge, and its cost has, I presume—at least, we are given to understand so—been finally settled by the Secretary of State for the Colonies. But I would like to take this opportunity of correcting what I believe to be a very erroneous impression formed by Mr. Chamberlain. To the deputation which met him some time ago he said: "Perhaps the members of this deputation are not aware that the narrow gauge line would cost only 10 per cent. less than a light broad gauge railway." Now, we have had no opportunity of stating that that was an entirely erroneous impression, and I think it is right that we should do so now. . . . . With regard to the Teaand Produce Committee's report, you will find a great number of proposals were discussed, but were not brought to fruition. We have at the present time a most important proposal before us, which refers to the abolition of the draft upon tea. I do not think I need at this time say anything with regard to the proposal, but I understand that it is the desire of both the Indian and Ceylon Associations that before any action is taken, and when the reports have all been received from Calcutta and Colombo, we should meet the committees of the Dealers' Associations and hear what they have to say upon the subject; and then I think it would only be right for a general meeting of importers to finally decide the course we ought to take. The assents to the proposal received from the importers in London have been far more than the committee were led to expect, and when we receive the further approval from Calcutta and Colombo, I think it will be practically unanimous. A general meeting of those concerned would, I think, be commendable to your acceptance, as it would be unwise to act precipitately in a matter of such vital importance to the tea interests. (Hear, hear.) With regard to the accounts, I need say nothing except that they show we are in a very flourishing condition. I only trust the year's work which is before us will be effective, and will produce the best results to this Association and to Ceylon generally. (Hear, hear.) I move that the reports and statement of accounts be adopted.

Mr. J. L. Shand: Knowing the value of time in the City of London, I would second the adoption of the report without comment, were it not that I think the occasion demands a little plain speaking. Our Chairman has told you the origin of this Association, and what it represents, and I would only endorse what he has said, that with every desire to co-operate with the representative public bodies in Ceylon, it is quite impossible that we can accept the position of a branch of the Planters' Association in Ceylon. We desire strongly that the initiation of any public movement should come from Ceylon, and we feel how much our strength is increased by our having the full weight of the public bodies in Ceylon at our back; but we cannot accept the position of being in any way subordinate to any public body in Ceylon, nor can we give up our right to initiate if we consider it necessary to do so. (Hear, hear.) . .

Mr. Thornton Williams said he hoped that the next time a deputation from the Association waited upon a Colonial Secretary, that gentleman would not be just recovering from the gout. (Laughter) According to the newspapers, Mr. Chamberlain was just getting over an attack of gout when the deputation met him. The speaker then dealt at some length with the proposal to abolish the 1lb draft allowance on tea sales, urging that the dealers should have been consulted before any action was taken in the matter.

The Chairman pointed out that no action had as yet been taken beyond ascertaining the wishes of the importers, and, as he had already stated, a meeting with representatives of the dealers will be held before a decision is arrived at.

The motion for the adoption of the reports and accounts was carried unanimously

The Chairman: The next business is the election of your President for the year. With your permission I will read a letter that the Secretary has received from Lord Stanmore:

"Toulouse, June 9, 1899.

"My dear Mr. Leake,—Will you kindly express to the meeting of the Ceylon Association in London my sincere regret that my absence from England prevents my being present at it.

"I have often said that it might be better for the Association to have a younger and more active President, and such is still my opinion; but I confess that under present circumstances I should regret the severance of my official connection with the Association, and therefore, should its members be willing to re-elect me I shall be happy to serve as President for another year. (Applause)

"Again expressing my regret that circumstances should prevent my being present at the meeting, which will, I trust, be a harmonious and satisfactory one. I remain,

"Yours very truly,

"STANMORE."

Mr. Henry Bois: I have much pleasure in proposing that the office of President shall again be filled by Lord Stanmore. (Hear, hear.) It is unnecessary to speak at any length to the nomination, and I do not intend to refer in detail to what has taken place on the Northern Railway question. But as his action has been the subject of some amount of undeserved and indiscriminating criticism,—I should like to say that the impartial, temperate, and dignified position Lord Stanmore has taken up under the somewhat difficult circumstances of the last few months entitles him to the renewed confidence of this Association—(hear, hear—and also adds to the debt already due to him for the interest he has taken in our affairs for a long series of years. (Applause.) As to whether it is desirable that Lord Stanmore, as an ex-Governor, should be President of this Association, I should like to say that from the Association's point of few his connection with us as our President is very valuable. A large proportion of our members are connected with the planting industry, and our representations are liable at tmes to be suspected of being made in our own interest. It is therefore important that we should have as our President one who cannot be suspected of anything but the most absolute impartiality, and we cannot hope to find anyone more impartial than an ex-Governor, who for many years so ably looked after the interests of all classes of the community in Ceylon. (Hear, hear.)

Mr. A. W. Stopford Sackville: I have much pleasure in seconding the proposition that Lord Stanmore be re-elected President of this Association. Every one of us knows the services he has rendered to all classes in the colony. (Hear, hear.)

The proposition was carried unanimously.

Mr. Sholto G. D. Skrine: I propose that Mr. H. K. Rutherford be re-elected Vice-President of the Association. (Applause.) It is unnecessary to say anything in favour of the proposal. W could not have a more competent, a more hard-working Vic President, or one in whom we should have more complete con dence, than Mr. Rutherford. (Hear, hear.)

Mr. W. S. Bennett: I have much pleasure in seconding We a know Mr. Rutherford's worth, and his capacity for hard work.

The proposition was unanimously agreed to.

The Chairman: I thank you, gentlemen, for re-electing me. had begun to think of retiring—(no)—but as it is your wish I hav much pleasure in accepting office again. (Hear, hear.)

Mr. J. L. Shand: There is another office-bearer about whom could say a good deal, and that is our Secretary. (Applause.) think all through this somewhat acrimonious correspondence abou the Northern Railway that has been forced upon him he has show that dignity and that temper which we all know him to so eminentl possess. (Hear, hear.) He has had several hard things said abou him, which he laughed at as we did. But he had a nice thing sai about him by the "Ceylon Observer" a little while ago, for he wa spoken of as "the indefatigable guardian of Ceylon interests i London." (Hear, hear.)

Mr. Ralph A. Cameron: I second the proposition with grea pleasure. The services Mr. Leake has rendered have only bee emphasised during the late criticisms. (Hear, hear.)

The proposition was unanimously agreed to.

Mr. W. M. Leake: I am much obliged to you, gentlemen. As rule we have said of ourselves at these meetings, "Happy is th Association that has no history." (Laughter.) A change has com over the spirit of our dream; and we have had during the year le tures from a Secretary of State, from a Governor, from two impo tant Associations, and now, finally, we are confronted by an "astound ed" Lord Mayor. The immediate effect on me of these things h been refreshing feeling of youth and inexperience such as I hav not tasted for years past. (Laughter, and hear, hear.)

The Chairman moved, and Mr. John Hamilton seconded, and was carried that the Executive Committee be re-elected (Mr. W Herbert Anderson, Mr. Henry Bois, Mr. Alexander Brooke, M R. A. Cameron, Sir G. W. R. Campbell, K.C.M G., Mr. F. H. M Corbet, Sir Richard Cayley, Sir John Grinlinton, Mr. John Hamil ton, Mr. W. Rollo, Mr. A. W. Stopford Sackville, Mr. J. L. Shand Mr G. A. Talbot, Mr. W. J. Thompson, jun.); and that Mr. Sholt G. D. Skrine be added to the Committee.

Mr. Leake moved that the Tea and Produce Committee be re-elec ed. He said it was an important committee at the present juncture for, as Mr. Thornton Williams had said, it had an ardous duty to pe form. The draft allowance question would need much tact an quiet treatment if it was to be satisfactorily settled. The Asso ciation hoped to meet the dealers in the most amicable way poss ble. (Hear, hear.)

The motion was agreed to.

The proceedings closed with a vote of thanks to the Chairman proposed by Mr. A. Brooke, who said he was rather disappointe to hear that afternoon that the Northern Railway question migh be regarded as closed. A letter in the "Morning Post" from Lor Stanley of Alderney had led him to think that the question wa still undecided.

THE INDIAN TEA ASSOCIATION (LONDON).

The following is an abstract of the proceedings of a meeting o the Committee held on Tuesday the 13th ultimo:—

Present:— Messrs. W. H. Verner (in the Chair), A. Bryans, G W Christison, D. Cruickshank, R. Lyell, J. Riddell, A. G. Stanto C. C. McLeod, J. N. Stuart, and R. G. Shaw. The minutes of th last meeting, held on Thursady, May 25, 1899, were read by th Secretary and confirmed.

Correspondence with Calcutta, which had been previously ci culated to the members, was laid upon the table.

Labour Question.—A letter, enclosing circulars of the Centra Recruiting Agency and minutes of Board of Management meetin received from Mr. H. C. Begg, Calcutta, was read by the Secretar and it was resolved that the Secretary should again address thos companies which had not yet signified their approval and elic their views. The Secretary was also instructed to write to Ca cutta, stating that the Committee is almost unanimously in favou of the Central Recruiting Scheme, but that in case the suppor required by the Calcutta Committee be not attained efforts shou

e made to induce Government to follow the Central Recruiting Association's scheme, as far as possible, and obtain a close time for Arkatti recruiting.

OCEAN FREIGHTS.—After some discussion, it was resolved to bring his matter before the annual meeting, so as to decide whether notice should be given to the Calcutta Steam Conference of the ermination of the agreement.

WORK IN AMERICA.—Mr. Mackenzie's proposal to continue the oint advertising work to some slight extent during July and August was agreed to.

PARIS EXHIBITION, 1900.—Progress of arrangements for securing additional ground at the Paris Exhibition was reported; a fresh plan submitted and approved.

PROPOSAL *re* 1-LB. DRAFT.—A special meeting of the Joint Committees was to be arranged as soon as possible.

It was noted that adhesions to this scheme to date amounted to 22½ million lbs. (Indian).

ERNEST TYE, *Secretary.*

STRAY NOTES ON MANURES.

Value of deep-rooted Plants.—Prof William P. Brooks, Massachusetts, writes:—Many of the most valuable green manuring crops are distinguished by the fact that they send their roots into the soil to an enormous depth. Such crops are highly beneficial in two ways: First, they bring up from the subsoil food not available to ordinary crops, but having been thus pumped up, as it were, they become available to succeeding shallow-rooted crops; second, it has been found that crops which are ordinarily shallow-rooted send their roots much deeper than usual when they are made to follow a deep-rooted, green-manuring crop. Thus, for example, Schultz-Lupitz has noticed that the roots of the potato which ordinarily develop almost entirely near the surface, penetrate deeply into the ground after a crop of lupines, following the burrows left by the decay of the roots of the lupines. This renders the potato less liable to injury from drouth, increases enormously the store of food within reach and so makes the crop more certain and larger.

Green Manuring may be the means of cleansing the field from weeds, for which purpose, of course, only the crops of the most rapid growth are useful. It increases the store of organic matter in the soil, and so furnishes the conditions favorable for the multiplication of earth worms, and these, as Darwin has pointed out, by their activities improve the soil in many ways, most important among which are better aeration, bringing of the finer materials to the top, pulverization and increased solubility of its constituents.

Uniformity of Nitrate of Soda.—In the analysis of Commercial fertilizers, nitrate of soda is always found quite uniform in its composition. The samples contain from 15 to 16 per cent. of nitrogen, in other words the nitrate it contains varies from 95 to 97 per cent. of pure nitrate. In 1898 analyses made by the New Jersey station there was one exception. A single sample contained as low as 12 per cent. of nitrogen. A search through the various records shows that this is the first sample showing such a marked inferiority. As a rule this fertilizer can be safely purchased without chemical examination The only attention that need be given is to the matter of securing it at the least possible cost. The same remarks apply to sulphate of ammonia, which, however, is not widely used.

Fresh Manure may with advantage be used for crops which have a long season of growth, while rotted manure, with its more available plant food, will give better results for such as gather their food and reach maturity during a shorter period. Excess of fresh manure tends to rankness of growth and the undue development of foliage, and is frequently the cause of lodging in grain and too much top or leaves in root crops

Seaweed as Manure.—An interesting paper upon seaweed as a manure is contributed by the Chemist of the Royal Agricultural Society, England, in which he explains that seaweeds generally are most valuable for manure, but there are differences in the percentages of dry matter and in the constituents. Nearly all the seaweeds contain in their original condition nitrogen in the organic form, not immediately available to plants; but the weed speedily decays and undergoes nitrification. The manure is very rich in potash, but poor in phosphates.

Phosphatic Fertilisers.—"Does the application of phosphatic fertilisers impoverish the land?" was a question put to the Government Agricultural Chemists of South Australia at a recent meeting of farmers, and the reply was," No. By adding phosphates where there is a deficiency of phosphoric acid in the soil, but not a lack of potash and nitrogen you enable the soil to produce a full crop in place of a deficient crop, and naturally so much more potash and nitrogen is removed with that extra amount of grain. If the phosphatic manure were not applied the increased crop could not be produced, and therefore the extra potash and nitrogen would not be taken out of the soil. In time, through the use of phosphates and the production of heavier crops, the supplies of potash and nitrogen would, of course, be diminished, and then it would be necessary to apply manures containing those substances."

Destroying Disease Germs in Manure.—By sprinkling manure with a 5 per cent. solution of ferrous sulphate disease germs and denitrifying organisms are destroyed in a very effectual manner.

Factors determining the value of Cattle Manures.—Food is the most important factor and the richer it is the better the manure. The quantity produced by any number of animals will depend largely upon the amount of food and water consumed. Manure from mature animals, other things being equal, is richer than from young animals; also animals producing wool, milk, etc., make a greater draft upon their food than fattening stock or those which are mature and at rest. The manure from these animals is not so valuable.

Permanent Enrichment of the Soil.—Mr. I. F. Tillinghast, Pennsylvania, says:—Whatever your crop, and regardless of the cost of production, as a rule, maximum yields afford a much greater margin of profit than minimum. To grow big crops requires rich land. Rich land and big crops will tend to make a rich man richer. Poor land and poor crops will make a poor man poorer. Then the question every farmer must put to himself is, How can I enrich my land at the least expense? I think I can answer this question with one word—clover. Start a rotation which will bring clover as often as every fourth year, and your land will continually grow richer and your crops better, and consequently your profits greater.

Not only do the clover leaves draw nitrogen from the atmosphere and enrich the soil, but the long roots penetrate deeply and draw up fertility from the subsoil below. Then the dense shading which the clover crop gives the soil through the fall and winter in some way adds fertility.

THE COFFEE INDUSTRY IN QUEENSLAND.

The *Cairns Argus* says:—The coffee industry has, of late, been attracting no small amount of interest. The perusal of periodicals and papers from all parts of the world, where coffee is already an established industry or is—as we are to some extent here—feeling its way, will show this. The great interest in this subject prevailing locally is due, to a great extent, to the presence in our midst of Mr. Newport, the Government Expert. On looking up his appointment in the *Government Gazette*, by the way, we see that his official designation is "Instructor in Coffee Culture." This looks and sounds well, but is rather a mouthful and, we note, has already been abbreviated into "expert." Brevity is the soul of wit—we don't know that North Queensland is given to wit—but we are accustomed to experts. And Mr. Newport will have to accept his abbreviated title. At the present time coffee culture in this district is drawing upon itself the eyes of the whole colony, and thereby the criticism of the public. Well, so much the better for it. If an industry cannot stand criticism, it cannot be worth much, and we cry welcome to the criticism of our methods and results, our victories and failures from the other coffee centres of the colony and the world, knowing that nothing but good can come of it. And with the confidence we have in this industry, we know that it will hold its own and steadily come to the front. There has been a slump in the coffee market lately, just as there was in flour two years ago in New South Wales, but we notice that coffee fluctuates pretty much as other such commodities do, and, in so doing, it will find its own level. Owing to the large output of Brazilian coffee not coming up to the estimated quantities, there is, we consider, a probability of a rise in prices again before very long. We note that the Southern Indian and Ceylon Industrial organs are, while observing this same point, taking a much more happy tone in their dis-

cussion of the question. Our coffees here do not head the market; but we think none the worse of the industry for this. We cannot expect it to run before it can walk; it can hardly expect to leap to the top of the tree at a bound, and admitting its errors, and learning by them, it must just work on to improve its quality as well as its quantity. One thing it will always have to buoy it up in its fight, and that is the fact that experts have pronounced the Queensland coffee as being, on analysis, as good as any grown elsewhere. In short, we think there is a good time coming—in fact is almost in sight already—and the endeavors of the growers must be, not to give up at the present look of low prices (they are no lower than they have been for the past five years or so), but to improve their methods of cultivation and thereby cheapen the cost of production, and make use of the expert's knowledge now given to them and to at the same time improve the quality of the marketable article so as to get higher prices. There is no doubt that the Cairns grown bean is excellent, and must come out not very far from the top on its analytic merits, if not from the size of its bean. The coffee season is now in full swing, and it is much to be regretted that the services of Mr. Newport are not available to go round and give advice and to set the growers straight where they may be going wrong. It must be excessively galling for the coffee growers, when, after years of agitation, they have at last had an expert given to them (and one that seems, judging from what we can see and hear from our editorial chair, to have gained the confidence of the growers even from the little time he has been able to attend to them), to have to stand by and see him used by the Department on other works, while they are perhaps losing the best part of a year's work in qualifying for low prices instead of high by methods of curing that he could advise on and improve upon for them. We are quite in sympathy with them in this. Agitations are being conducted from several sources to relieve him of his Fruit Inspection Duites—which now tie him to the wharfs of this town—and to allow him to go on with the work so well begun. The advantages of his being able both to make his head-quarters here, and to devote his time and attention and energies to the promotion of the industry, are too obvious to need reiteration or further comment. At a meeting held at Kuranda on the 10th May, the new "Cairns District Coffee Growers' Association" was formed. It was well attended—some 29 planters being present in person and some others, we understand, having written desiring to be enrolled. The movement, in fact, seems to have been the result of Mr. Newport's suggestions to some few of the growers a movement that has shown itself a popular one—and the action in forming the Association was practically a unanimous one among the growers. The larger plantations (including, we are proud to think, the largest in Queensland) were represented as well as the smaller, and the result of the meeting, we think, augurs well for the success of the scheme. At inaugural meetings of this nature, a great deal of talking and discussion is indispensable. They seem to have formed themselves into an Association on a few rules, and left the formation of the rest to a Committee. The Committee wasn't to be left far behind however, and in the accounts given of the meeting, the Committee's proceedings with the rules they passed are included in the report of the first meeting. The actual business of the meeting was the passing of some three resolutions:—(1) The supporting of the Chamber of Commerce in the action it took in asking for a rise in the import duty on coffee, (2) Supporting the Association in requesting the appointment of an independent Fruit Inspector to relieve Mr. Newport, and (3) a deputation to meet the Minister when he comes up here. The action of the young Association in endorsing the action of the Chamber of Commerce in two out of the three definite resolutions passed is, perhaps, worthy of a note or two. As a young Association, acknowledging and respecting its older relative, we congratulate the new Coffee Growers' Association on the very sensible way in which it has decided to endorse the action its more powerful senior has already taken in matters that affect itself. In course of time, however, we hope to see independent action, as we certainly think there is room for an Association as has just been formed. It must be borne in mind that the "big fellow" Chamber of Commerce must perforce look at things in a much wider light than the coffee growers. Take the question of Mr. Newport's work for instance, while the public may be asking why is Mr. Newport doing work that a man with half his salary could do as easily—the Chamber of Commerce must look at it from the point of view of the shippers, agents and the town's good, and ask why, if this thing has to be, is it that we have not an Inspector, always and at any time available, and who has no other duties the same time. While the coffee growers, in minding their o business, must look at it from their point of view, asking where our Coffee Expert? The Chamber of Commerce is doing excell work in its own line, and is now the older as well as the larger I titution. The Coffee Growers' Association will undoubtedly g in course of time, and be larger and more powerful as it gr older, and though it may never be as great and could never co in opposition to it, we would like to see it going hand in hand w the Chamber of Commerce and would condemn any tendency to come a mere perpetual sub-committee on coffee of the Chamber Commerce. Co-operation is always good, and we welcome new Coffee Growers' Association as being a sign of a good a healthy condition of our young industry. With this as a sign the times and the first fruits of the expert's services, we think th with an energetic and competent officer, such as Mr. Newp appears to be, holding this appointment, the industry will go stea ly ahead. We heartily congratulate the young Association is formation and wish it a prosperous and useful career.

COFFEE IN QUEENSLAND.

The following is, so to speak, a sequel to the article we publis last week about a new "Coffee Roaster." We quote from *Cairns Argus.*

We are indebted to Mr. Hepburn for the following informati which we gladly find room for:—

I left by rail for Kuranda on Monday morning, 22nd instant, companied by Mr. Mayers, President of the Cairns District Co Growers Association. Mr. Newport was also in the train, but out at Redlynch. It had been arranged that I should stop Redlynch on my return, to meet Mr. Newport there, and go or the Kamerunga State Nursery. I proceeded to "Glencair Mr. W. A. Mayer's estate. On Tuesday I went to Mr. Stree estate, "Fernhill," and on Wednesday to Mr. Hannam's est Myola. I made a second visit to each of the estates named, and Saturday last, while at Myola, Mr. Hannam made the first of patent rakes for working purposes, and used it with satisfacti I may here state that each of the gentlemen abovementio obtained from me the right to make the rakes for his own use o My principal interest being connected with the mode of drying coffee after pulping, I find that the sun does that duty at Gl cairn; at Fernhill the coffee is partially sundried, then comple by artificial heat. Mr. Street is a practical planter, and goes in any improvement to hasten the drying process, and he will use patent rake in both processes with economy of time and labor w efficiency. It will be of general interest to state that Mr St has, by his combined process dried the coffee on his trays u three days. His trays are of a very handy size to manage, be made of wood and perforated zinc, the inside measurement is 2 wide, 34 in. long and 4 in. deep. He puts a thin spread of co when in the sun, but increases the depth to $1\frac{1}{4}$ in. when placed side the furnace.

At Myola, Mr. Hannam, up to the present, has sundried, being a very enthusiastic planter he intends erecting some hea apparatus to be up-to-date. On all of these estates, Mr. Newp has already left his mark, and I can sympathise with the plan who are unable to obtain his services as soon as they would des but all in good time. The coffee tree grows most luxuriantly h the production per tree is simply astounding to planters and oth whose experience has been gained in other countries. Everyt tends to prove that Australian coffee, or at any rate North Que land coffee has its own peculiarities of growth. A superabund crop is produced, and the picking season goes on intermitt from about the middle of March to August. The cured b small, but with scientific instruction this is likely to increase. "up-to-date" planter will introduce all appliances to expe drying, but will give stern orders to the pickers to pick only cherry, and see that his pulper does not cut the parchm Attention to these points spells "success and profit," and grower who does not attend to these matters—whether he is gr ing a small patch or an extended area—will find that he mistaken his vocation.

The Hon. R. De Moleyns informed me that on his estate (about 80 acres), extensive artificial heating apparatus is put The same thing also applies to Mr. Lewis' estate, of about 2

The mildness of the climate here under a tropical sun is shown in the richness of the vegetation all around Cairns, at only a few feet above sea level. In the corresponding latitude of the Northern hemisphere, say in the West Indies, the vegetation on the coast suffers by a burning sun. To conclude. permit me to say that if your coffee is properly cured before being put on the market, it will be able to hold its own with the best grades of other coffee producing countries.

DISTRICT ASSOCIATIONS.

SHEVAROY.

PROCEEDINGS of a Quarterly General Meeting of the Shevaroy Planters' Association held in the Victoria Rooms, at 2 p.m., on Monday, the 3rd July 1899. PRESENT:—Rev. M. Andersen, Messrs. Thurston Short, C. A. G. Turner, C. Rahm, E. Dickins, C. G. Lechler (*Chairman*), Rev. J. M. Kempf, Messrs. J. C. Large, W. Rahm, S. Campbell, T. B. Nicholson, and R. Gompertz (*Honorary Secretary*).

1. *Read* Circular 65/99 of 9th ultimo from Secretary, U. P. A. S. I., enquiring what quantity of Basic slag has been imported by members of this Association.

Resolved, that Honorary Secretary be requested to inform him that only 12 tons of Basic slag has been imported direct by members of this Association; but that a good deal of it has been purchased from estate agents, *viz.*, Messrs. Arbuthnot & Co. (Kallai Works), and Messrs. T. Stanes & Co., and Peirce, Leslie & Co., of Coimbatore, who will no doubt furnish the quantities they have sold themselves.

2. *Read* Circular 68/99, dated 16th June, 1899, from Secretary, U. P. A. S. I., forwarding proposed Agenda paper.

Resolved that the Chairman and Honorary Secretary of the Shevaroy Planters' Association be elected delegates to represent this Association at the General Meeting of the U. P. A. S. I., to be held on the 14th proximo.

Resolved, that the Secretary, U. P. A. S. I., be requested to add "advertising Indian coffee" to the Agenda paper; and that he be informed that this Association is desirous of sending a sample of Shevaroy Hills' coffee to the Paris Exhibition, weighing about 40 lbs. (which, including the box containing it, will probably occupy, say, two cubic feet), if space can be afforded them in the tea and coffee-room.

3. *Read* letter, dated 27th ultimo, from the Traffic Manager asking for statistics of traffic on the Ghaut road.

Resolved, that the Honorary Secretary be requested to send him a copy of the statistics lately obtained with reference to the proposed Ghaut road, at the same time informing him that, in the opinion of the Association, the figures given are very much under the mark.

Read and *recorded* the following letters:—

44/U.W. Circular from the Secretary, U. P. A. S. I., regarding the Rs. 500 voted from the Reserve Fund to meet the expenses of Mr. Cameron's visit to Coorg.

45/U.W. Circular from the Secretary, U. P. A. S. I., regarding the import duty on Basic slag.

46/U.W. Circular from the Secretary, U. P. A. S. I., regarding the I. T. A. and the Paris Exhibition, and requesting to be informed as to what sum the U. P. A. S. I., are prepared to spend in conjunction with the I. T. A. in opening a coffee and tea-room.

47/U.W. Circular from the Secretary, U. P. A. S. I., informing that it has been decided that the next *Annual Meeting* of the U. P. A. S. I. shall be opened at the Cubbon Rooms, Bangalore, at 2 P.M., on Monday, the 14th August, 1899. A Committee Meeting will be held at 11 A.M. on the same day, and requesting to be furnished with a list of our delegates and also with a note of any special subjects which our Association would wish to be added to the Agenda paper at end of Circular.

48/U.W. Circular from the Secretary, U. P. A. S. I., regarding stamp duty on Crop Hypothecation deeds

40/U.W. Circular from the Secretary, U. P. A. S. I. *The Paris Exhibition, 1900.* District Associations are requested to submit recommendations, suggestions, etc., regarding the offer of Government in respect of certain space in the Indian Imperial Court of the Paris Exhibition.

Letter from John Haddon & Co. giving market prices of coffee, and requesting that produce may be entrusted to them for sale.

The following papers were laid on the table:—

Produce World, 5 copies, dated January 6th, February 3rd, March 3rd, April 7th, and May 5th, 1899.

Planting Opinion, 3 copies, dated June 10th, 17th and 24th.

Agricultural Ledgers No. 4 (Ragi).

Proceedings of the Lower Pulneys Planters' Association, Dindigul.

Proceedings of the Wynaad Planters' Association.

Appendix II, List of plants seen while touring in the Province of Coorg, November, 1898.

Two copies of the Journal of the Royal Agricultural Society of England.

(Signed) C. G. LECHLER,
Chairman.

YERCAUD, *4th July* 1899. } (,,) ROBT. GOMPERTZ,
Honorary Secretary.

CENTRAL TRAVANCORE.

The Quarterly General Meeting of this Association was held at the Pambanaar Bungalow, on Thursday, June 29th, 1899:—PRESENT:—Messrs. R. H. Goldie (*Chairman*), G. L. Acworth, R. W. Cole, (by proxy), H. D. Deane, F. Bissett, H. M. Knight, B. Laurie, W. H. J. Leahy, J. E. G. Pigott, E. Lalter, and A. E. Veale (*Honorary Secretary.*)

The Chairman, Mr. R. H. Goldie, said before proceeding to the ordinary business of the day he had two very pleasant duties to perform, the first was to tender a very cordial welcome to Mr. G. L. Acworth on his return from England. Mr. Acworth had always taken a very keen interest in the Association and he had lately represented S. Indian Planters before the Currency Commission as ably as he had many times represented this Association at the annual meetings of the U. P. A. S. I.

The second duty was to propose a very cordial and hearty vote of congratulation to Mr. F. A. Nicholson, the Acting British Resident in Travancore and Cochin, on the well-earned honor which had recently been conferred on him. The proposition having been duly seconded was carried unanimously.

The minutes of the last meeting were taken as read.

Read letter from the Dewan *re* Outlet roads.

After some discussion on the subject, Mr. Acworth proposed and Mr. Leahy seconded the following resolution:—"That this Associ-"ation after discussing the matter consider that it was customary "to grant roads in the past to land bought from H. H. Government "for coffee and tea cultivation and that they request Mr. Knight, "who is proceeding to Trivandrum, to interview the Dewan on the "subject." Carried *nem. con.*

Read and recorded letter from Chief Secretary to Madras Government in *re* the Pulliar Suttu Bridge on the Kumili Ghât.

The Honorary Secretary informed the meeting that the Bridge was now in good order.

Read and recorded letters from the Dewan and Chief Engineer in *re* erection of a covered landing stage at the Kodimatha landing place at Kottayam.

Resolved "That the subject be again brought to the notice of the "Dewan at some later date."

Read copy of a letter from the 1st-class Magistrate to the Cardamom Hill Superintendent *in re* removal of the Pambanaar Arrack Shop.

The Honorary Secretary informed the meeting that Mr. Sealy had promised to advise the Dewan Peishcar of Kottayam to cancel the license for this shop; but up to date he had not heard if this had been done.

Resolved "That the Secretary do address the Cardamom Hill "Magistrate on the subject without delay."

Read and recorded with satisfaction letter from the Dewan notifying that Messrs. Goldie, Laurie, Leahy, Deane, and Veale had

been empowered to exercise the powers under section 4 of the Travancore Game Perservation Regulation.

Resolved "That the Dewan be requested to confer similar powers "on Messrs. Acworth, Holder, Barett and Latter, as this Association "do consider the present number insufficient for the adequate protec- "tion of game."

Read and recorded letter from the Postmaster-General in *re* the affixing of senders names to Postal receipts.

Read Honorary Secretary's letter No. 125, dated 23rd April to Cardamom Hill Magistrate in *re* local Magistrate.

Read Local Magistrate's letter in reply.

The Chairman moved and Mr. Veale seconded the undernoted resolution "with reference to the resolution—That the Honorary "Secretary do write to the Cardamom Hill Magistrate with reference "to the manner in which Europeans are treated by the local First- "class Magistrate when attending his Court, which was passed "at the last general meeting of the Association held on 8th April, "the Association having made fuller enquiries find that the charges "made could not be substantiated and regret that they should "have taken action in the matter." Carried *nem. con.*

It was also resolved that a copy of the above resolution be sent to the local Magistrate.

Read letter from the Cardamom Hill Magistrate in *re* the Cattle Pound to be erected at Kuttakarnum.

Mr. Deane expressed his willingness to erect the Pound on the conditions named and promised to inform the local Magistrate when the Pound had been built.

The Honorary Secretary briefly stated the correspondence that had passed between the British Resident and himself with reference to the procuring of carts for the Resident's use on his visits to these hills.

The British Resident had undertaken to employ Mr. P. John as his agent and to ask all other European officials in the Government service to do the same.

Read and recorded with satisfaction letter from the Dewan authorizing members of this Association to pay their taxes into the local treasury by cheque instead of as heretofore in cash.

Read letter No. 163, dated 24th May from the Honorary Secretary to the Chief Secretary to Madras Government in *re* the disgraceful state of the Kumili Ghât Road.

The Honorary Secretary stated that the road was still in bad order and that he was still in correspondence with the Madras Government on the subject.

Read Circular letter from the Honorary Secretary calling for subscriptions to the American and Continental Market Fund.

The Honorary Secretary expressed a hope that all members would again subscribe as liberally this year as they had done in the past.

It was true other Associations had not subscribed as liberally as they might have done, but that was no reason why they should stop doing so. He reminded members that their late Chairman, Mr. F. M. Parker, had on one occasion counselled them to go nap for all they were worth on the American Market Fund and he (the Secretary) thought no better advice could be followed.

It was, he said, essential to find new markets for our tea if the industry was still to remain a profitable one, production was still on the increase though, less so than in previous years.

Mr. Acworth, in endorsing the remarks made by the Honorary Secretary, mentioned that the consumption of tea in the United Kingdom had almost reached its limit and the importance of finding new markets for our tea was thus very great. He also drew attention to the fact that Messrs. Gow, Wilson and Stanton had recently stated that no less than 50 million pounds of tea had been relieved from the London market owing to the action of the Ceylon Planters and Indian Tea Associations.

It was resolved "That this Association do agree to support the "Indian Tea Association in their Foreign Market Fund."

It was also resolved "That the Honorary Secretary do write to the "Honorary Secretaries of the Travancore Planters' Association and "Kanan Devan Planters' Association asking them if they had sub- "scribed and to ask them to support the Fund."

U. P. A. S. I Delegate.—Mr. Veale proposed and Mr. H. M. Knight seconded "That Mr. Acworth be elected to represent this Associa- "tion at the forthcoming annual general meeting of the U. P. A. "S. I. to be held at Bangalore, on 14th August." Carried *nem. con.*

Proposed by Mr. H. M. Knight and seconded by Mr. Deane "that "Rs.150 be allowed Mr. Acworth towards his expenses."

Bolted Coolies.—Mr. Leahy proposed and Mr. Veale seconded "That no Superintendent, writer, or cangany should take on "Cangany or Moopen in this District without first receiving "a 'tundu' or discharge note from the estate he was leaving and which "must be signed by the Superintendent thereof" After some discussion as to the usual method adopted by members of this and other Associations in such cases, the resolution was carried *nem. con.*

Seizure of Carts by the Cottayam Kotwal.—Mr. Deane proposed and "Mr. Pigott seconded, "That this Association do call the Dewan's "attention to the continual seizure of carts by the Kotwal at "Kottayam and respectfully ask him to intimate to the Association "if the Government of Travancore supports this illegal action of "their officials whenever any one in authority travels." Carried with one dissentient.

Labour Rates.—Mr. H. M. Knight drew attention to certain rates of labour in the district and after a protracted discussion, it was resolved, "That a Sub-Committee consisting of Messrs. Goldie, "Acworth, Leahy, Deane, Laurie, H. M. Knight, Latter and the "Honorary Secretary (*ex-officio*) be appointed to draw up a scale of "rates for labor and artisans and that the same be printed and "circulated for information of members."

Paris Exhibition.—Read letter No. 62/99 from Secy. U. P. A. S. I.

Resolved "That this Association delegate be given full powers to "act in this matter."

Resolved "That this Association will send an exhibit through the U. P. A. S. I.

Read letter from the President of the Travancore Government Paris Exhibition Committee.

Mr. Deane suggested that every estate having a factory should send samples of tea to the President of the Committee to be forwarded by him to the Paris Exhibition, provided that the teas would be shewn in a suitable case.

Mr. Deane, who said that he had often exhibited teas at Exhibitions, explained what was usually done and stated the means by which he thought an effective display could be obtained.

It was resolved "That a Sub-Committee consisting of Messrs "Goldie, Acworth, H. M. Knight, Laurie, Leahy, Deane, Cole, "Latter and Pigott be appointed to decide on details and arrange "that the samples sent should be as uniform as possible."

Resolved "That Mr. H. M. Knight do call on the Government "Committee and make such arrangements as may be deemed "necessary."

Transit of Goods from Shoranoor to Kottayam.—Mr. Laurie proposed and Mr. Acworth seconded, "That the Honorary Secretary "do correspond with the Shoranoor Transit Agent with a view "to obtain cheaper rates of freight from Shoranoor to Kottayam "than are at present obtainable by Transit boats." Carried *nem. con.*

Munsif's Court.—Mr. H. M. Knight proposed and Mr. Acworth seconded, "That H. H. Government be asked to establish a "Munsif's Court in this district." Carried *nem. con.*

It was further resolved, "That Mr. Knight, while in Trivandrum "be asked to interview the Dewan on the subject."

With a vote of thanks to the Chairman and Honorary Secretary the meeting terminated.

WYNAAD.

Proceedings of Committee Meeting of the Wynaad Planters' Association held at Perindotty, on 28th June 1899.—PRESENT :—Messrs. J. W. Hockin (*Chairman*), M. Douglas Taylor, H. B. Winterbotham, and E. de Fonblanque (*Honorary Secretary*).

Proceedings of last Meeting.—The Proceedings of the last Meeting were taken as read.

District Board Member.—Mr. M. Douglas Taylor was elected Member to the Malabar District Board during Mr. R. K. Walker's absence.

Pudu Padi Postal Delivery.—*Resolved*, that the Association is prepared to pay Re.1 per mensem towards the delivery of letters at Pudu Padi.

Delivery of Postal Matter.—The Secretary was requested to find out the rules regulating the delivery of money orders, V. P. and other parcels, letters, papers, etc.

Medical Secretary.—*Resolved*, that the Doctor be requested to act as Secretary pending the decision of the next General Meeting to be held on 2nd August.

Roads.—*Read* Government Order stating that the Rs.7,250 for up-keep of the Chundale-Sultan's Battery Road shall be spent on repairing the Ghaut road.

(Signed) E. DE FONBLANQUE,
Honorary Secretary, W. P. A.

NEIGHBOUR WOLFF AND OTHERS.

ALMOST every afternoon in pleasant weather I see my neighbour Wolff sitting in an easy-chair in the shade in front of his own door. Sometimes he kills time by reading the paper, but oftener he does nothing but watch the people and the vehicles that pass. I frequently stop and talk with him a few minutes, and he appears to be grateful for the trifling attention. He is a man of about fifty, strongly and sturdily built, and to look at him you see no reason why he should not be up and about as actively as the best of us. He is intelligent and well-informed, has travelled considerably, and is a man in every way worth knowing. His ideas on finance and business seem to be clear and practical, and it strikes a stranger as odd he does not grapple with his opportunities and pile up a big fortune. Yet he never makes a motion in that direction. He lets the chances all slip by, and just sits there as though the world were no more to him than the Klondyke goldfields are to the resident population of a cemetery. Yet my neighbour Wolff knows what money is, and appreciates what can be done with it. Then why doesn't he "get a move on," as the Yankees say, and make hay while the sun shines? Take a peep at him about nine o'clock at night, when he takes his customary exercise on the pavement—the way being mostly clear of pedestrians by then—and you will need no verbal answer to the question. Stocky and strong as he appears when in his chair, he makes a poor show on his legs. Slowly, heavily, leaning hard on his thick stick, he goes to and fro a few times between the corner and his house—a distance of 200 feet may be—and then with a sigh sinks again into his chair like a man who realises he is out of the race. A paralytic stroke two years ago, and the constant fear of another—that explains it. He is one of the multitude who are in the world and not of it—as this woman was a while since:—

"From my girlhood," she says, "I was always oppressed and hindered by weakness, I was habitually tired, weary, and languid. Like all such persons I lived a kind of life to myself. All pleasures or pursuits which called for energy and vitality were closed to me. I had a feeble and fitful appetite, and what I ate gave me great pain at the chest and back, and a sense of coldness, deadness, and weight at the stomach. At times, there would be also a gnawing, sinking feeling.

"As I grew older I was much troubled with palpitation of the heart and loss of sleep. Year after year I dragged along in this miserable way, and, being too weak to walk, was drawn from place to place in a Bath chair. Every effort was made to obtain a cure. I consulted doctor after doctor, and took many kinds of medicine and treatment, but got no more than temporary relief. One doctor said my heart was diseased.

"My sister urged me to try Mother Seigel's Syrup. Without any great hopes of its effect in my case, I nevertheless procured a bottle from the Stores in High Street and began to take it as directed. The result was a decidedly improved appetite, and I relished and digested what I ate without any pain or distress following. As I continued to use this medicine the heart trouble was less frequent and finally ceased altogether. My nerves soon became stronger and I could sleep well. In a few weeks more I was *better and stronger than ever before in my life*, and have enjoyed good health ever since. My friends were almost as much surprised and pleased as I was at this remarkable result of taking Mother Seigel's Syrup, and you may make my statement public if you think it will do good."—(Signed) (Mrs.) Mary Ann Welch, 1, Constitution Hill, Luton, Chatham, February 6th, 1895.

My neighbour Wolff may or may not recover from his paralysis, but all cases like Mrs. Welch's—indigestion with consequent weakness and nervous debility—should be curable by the remedy which cured her. It opens and renews the digestion, which is the fountain of life, and puts a wholly new aspect on the world around us. From having been laid aside as cumberers of the ground, we become once more workers with others and sharers of their pleasures.

MARKET REPORT.

By Mail Advices of 16th June 1899.

COFFEE.

The *London Commercial Record* says:—The leading characteristic of the market during the week has been the unwillingness to transact business. Plantation Ceylon was generally of such poor quality that it was difficult to sell any. A large proportion of the supplies of East India failed to elicit offers, and have, in consequence, been withdrawn, so that, although the catalogues have represented a considerable weight of Coffee, the transactions are moderate; a fall of 1s to 2s per cwt. was accepted on the greater part sold. Central American growths included some parcels the quality of which attracted considerable attention, but the bulk met a continually drooping market and sold at record prices—the lowest ever known. There is no change of importance in "futures," the slight alterations which have occurred being in favor of buyers. We quote:—

London	... Santos	... Sept. delivery	...	28s.
New York	... No. 7 Rio...	„ „	...	4·80 cents.
Hamburg	... Santos	... „ „	...	28¼ pf.
Havre	... Santos	... „ „	...	34½ francs.
Holland	... Good ordinary Java	..	...	27¾ cents.

Imports, Deliveries and Stock of Coffee in London are as follows:—

		Stock.		Imports.

TEA.

China.—Congous are slow of sale, but fine qualities of Green are in request at full rates. Auctions during the week have presented 5,320 packages, which partly sold sold as follows.—Congous.—Panyong 6¼d to 8½d, Souchong 5½d to 9½d, Oolong 4¾d to 9¾d, new make Congou 6½d to 6¾d, Moning 6½d to 11¼d. Scented Caper 7½d to 7¾d, Scented Orange Pekoe 6¾d to 8¾d. Moyune Green.—Gunpowder 7d to 10¼d, Young Hyson 4¼d to 7½d, Foong Mee 8½d to 10d, Sow Mee 6d to 9d per lb.

Indian.—Public auctions were on a somewhat smaller scale, including 10,400 packages, of which 3,800 were new season's, against 14,300 packages (1,050 new season's) on the 5th instant, and 9,1·0 packages (1,500 new season's) at this period of 1898.

There was a fair demand for the shipments of old crop offered, particularly for those lines drawing good coloury liquor, and no great change occurred in quotations. Recent arrivals of this manufacture, however, only received moderate attention, and a further decline had in most cases to be accepted, quality at present not being considered by the trade sufficiently useful to take them freely into stock.

For 2,800 packages (new season's) on Garden account 8⅛d per lb. was obtained compared with 9⅛d per lb. for 1,400 packages in the preceding season.

Ceylon.—Sales were lighter, *viz.*, 25,900 packages contrasted with 34,400 packages last week and 31,200 packages a year ago.

Rather more enquiry was noticeable for choice-flavoured lots over 11d per lb. and a few with stand-out cup brought higher rates than have been registered lately for the same marks. Good medium kinds both leafy and broken passed with considerable irregularity and generally in favour of buyers, while commom to medium in many instances were ¼d per lb. lower, Pekoe Souchongs and poor Pekoes often selling down to 6¾d per lb.

The average is slightly over 7½d per lb. On the 8th instant it stood at 7¾d per lb., and 7⅝d per lb. in 1898.

Java.—Nearly 1,800 packages of direct import were submitted and went off at about valuations Over 2,000 packages are announced for the next fortnight.

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns, were:—

From 1st to 13th June, 1899 ...	...	6,360,832 lbs.
,, ,, 1898 ..	...	7,051,312 ,,

During the fortnight the following have been printed for sale by public auction:—

	Sold.	Withdrawn	Total offered.
	Pkgs.	Pkgs.	Pkgs.
India	8,356	2,000	10,356
Ceylon	22,847	3,041	25,8·8
Java	1,733	31	1,764
Total ...	32,936	5,072	38,008

Also 1,872 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report dated June 16th, 1899, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1st JUNE TO DATE.

	Indian.	Ceylon.	Java.
1899-1900 ...	28,258 pkgs.	61,361 pkgs.	2.148 pkgs.
1898-1899 ...	20,395 ,,	56,463 ,,	1,912 ,,

12,195 pkgs. Indian
26,181 ,, Ceylon
1,821 ,, Java
} Total 40,197 packages were offered in public auction this week.

Satisfactory progress continues to be made in the use of Indian and Ceylon Tea in markets outside the United Kingdom. It is a particularly satisfactory feature to notice hat the quantity taken during the first three months of 1899 is larger than that in the corresponding period of 1898, in spite of the high price ruling in the early part of the present year, which, although it may have curtailed the trade to some extent has evidently not materially interfered with its progress.

	1899.	1898.	1897.	1896.	1895
Indian	4,994,148	4,631,650	7,090,639	4,385,921	2,108,761
Ceylon	7,432,035	7,641,405	6,060,271	4,833,025	3,552,209
Total lbs. ...	12,426,183	12,273,055	13,150,910	9,218,946	5,650,970

In the first three months of 1897 the quantity taken was unusually heavy, but with this one exception, steady progress has been made for several years past.

Indian.—Sales passed without material change in prices. The new Teas, which were mostly disappointing in quality, did not prove of much interest to the trade, prices for all except the lower grades being unusually low, with a somewhat week market

Ceylon.—Buyers discriminated in the week's sale more than they have done for some time past, given considerable attention to Teas with good character, prices for which showed an occasional slight advance, while lower and medium grades were inclined to be less animated and prices occasionally fell ¼d. per pound. Average for week 7·61d. against 7·58d in 1898.

Java.—The few Javas brought forward sold somewhat slowly with a tendency towards easier rates.

Bank rate 3 per cent. Exchange on London three months' sight. Calcutta $1/4\frac{3}{32}$. Colombo $1/4\frac{3}{32}$.

IN CANADA.

The *Canadian Grocer* of 1st June says:—The first shipment of new season's Japan tea reached the Toronto market on Monday The shipment was a small one. The quality in both cup and leaf is good, and rather better than that of the first shipment last year. The price is, however, lower. But cables received this week state that the market is active, with prices tending upwards, showing that there is a continuance of the conditions noted last week. The next direct shipment of Japan tea is expected in Toronto about June 12.

COCOA.

There were no public sales held on Tuesday, the previous week's auctions having proved so unsatisfactory. Privately a quiet tone has prevailed, not more than about 1,000 bags selling during the week, amongst which we note—fine to superior Trinidad 72s to 79s, fair to good ditto 67s to 70s, Grenada 66s, Jamaica 58s to 64s, fine African 63s, Guayaquil Caraquez 67s 6d to 69s 6d, fair to fine Arriba at 70s to 75s, and fair Ceylon at 67s 6d to 69s per cwt.

PEPPER.

Black.—The market is quiet in tone, and values have tended in favour of buyers. About 150 tons Singapore are reported sold at $5\frac{3}{8}$d down to $5\frac{5}{16}$d for fair on the spot, at 5½d May-July shipment, at $5\frac{5}{8}$d down to $5\frac{9}{16}$d for June-August, and at $5\frac{1}{16}$d down to $5\frac{5}{8}$d for July-September and August-October.

The shipments of Black Pepper for the first half of June compare as follows:—

	1899.		1898.	
U.K.—Singapore...	300	550	210	420
,, Penang ...	220		210	
Continent		130		*nil*
United States		80		50
Total tons		760		470

At public sale on Wednesday offerings consisted of 59 bags Singapore and 160 bags Tellicherry, both of which were bought in at 5½d per lb.

White is also quiet, with sales of 100 tons, including fair Singa-

pore on the spot at 8 1/16d, May-July shipment at 8 3/4d, July-September 8 7/8d, and fair Penang on the spot at 8 1/16d per lb.

The shipments of White Pepper for the first half of June compare as follows:—

	1899.		1898.	
U.K.—Singapore...	50	220	*nil*	260
„ Penang ...	170		260	
Continent		20		50
Total tons		240		310

At auction on the 14th instant, of 13 cases 279 bags Singapore brought forward, 86 bags good bold sold at 8 5/8d. 102 bags Siam passed the hammer unsold at 8 5/8d, and 212 bags Penang at 8 1/4d per lb.

GINGER.

Cochin.—The long-continued depression accompanied by low prices in this article has at length given way to a better tone, and speculators have now entered the market. The result is that sales to the extent of about 2,000 bags have taken place privately this week at advanced rates—ordinary to fair medium and small washed rough Cochin at 22s to 25s, and brown Calicut rough sorts at 23s to 25s per cwt. Cut kinds have, however, not participated in the improvement.

At public sale 252 cases 537 bags were catalogued, of which 83 cases 300 bags found buyers—rough at fully private sales' prices, but the commoner cut descriptions at a decided decline. Bold cut and scraped limed realised 75s, bold and medium ditto 70s, medium and small, a little bold, leanish roughly cut and scraped limed 42s, small part medium ditto 26s to 26s 6d, small tips 23s; medium and small plump washed rough slightly shrivelled 24s, smaller ditto part dark and rough 23s to 23s 6d; leanish Calicut rough sorts 23s, damaged cuttings 14s per cwt.

Japan is also dearer, about 200 bags fair selling privately at 19s 6d to 20s per cwt. At auction 81 bags were bought in at 21s, 19s 6d per cwt. being refused.

Jamaica—818 barrels, etc., were offered, of which 265 barrels, etc., sold. Good qualities appreciated 2s to 3s, but the less desirable grades were 1s to 2s per cwt. cheaper. Fair to good plump bright washed 70s to 77s, medium to good medium 67s to 69s 6d, ordinary to good ordinary 57s 6d to 64s 6d, lean and dark 51s 6d to 56s 6d per cwt.

St. Lucia.—23 bags bought in at 56s per cwt.

CINCHONA.

As reported in our last issue, the sales at Amsterdam passed off quietly, the unit having fallen by a fraction of a cent to 8 1/4c., but there was a large amount of low-grade bark sold at about 7 1/4c., and this gave a factitious cheapness to the average. The details of the auction were given in our cablegram, but we may add that the bark sold for manufacturing purposes contained the equivalent of 515,575 oz. of quinine sulphate, apart from some not analysed and which was estimated to yield 19,095 ozs. of sulphate. These figures do not include druggists' bark. Some fine succirubra quill was included in the sales, 61c. per ½ kilo. being the highest price paid for this. Between 8c. and 8½c. was the unit paid for nearly 1,000 kilos., of the quinine sulphate in the bark, and as high as 9c. was reached for bark representing 783 kilos. of sulphate.

Four steamers which left Batavia in the fortnight ending May 1 had on board 626,787 Amst. lbs. of cinchona bark. The heaviest of the shipments was 249,407 lbs. in the *Anchises*, which sailed on April 29, and the next heaviest 202,468 lbs on the *Madura*, which sailed on May 12. There were also sent by these vessels 418 cases of quinine, all to London, except 25 cases which go to New York. By the *Anchises* 175 cases come to London, and by the *Titan* (sailed May 5) 218 cases.

Amsterdam Bark Market.—The detailed particulars of the Amsterdam bark auction of last week are as follows:—About 20 tons (20,623 kilos.) of *Manufacturers'* bark were actually sold in the auction, and about 1½ tons (1,748 kilos.) of *Druggists'* bark. There were bought in about 1¼ tons of the former, and about 1 cwt. of the latter. So that nearly the whole amount offered was sold. The buyers purchased as follows:—

English and American Quinine factories (principally).	Brunswick factory.	Mannheim and Amsterdam factories.	Frankfort and Stuttgart factories.	Miscellaneous buyers.	Total sold.	Bought in or sold previously.	Total offered.
Tons.	Tons.	Tons.	Tons.	Tons.	Tons.	Tons.	Tons.
5.583	3.765	5.308	3.415	3.406	21.477	1.288	22.765

The tone of the auction was quiet: the unit selling price worked out at 8.25 cents per ½ kilo (1½ per lb.), against 8·5c at the last auction, a decline of rather over 3 per cent. Of the bark put up 73,382 kilos. were Succirubra, 369,720 were Ledgeriana, 38,698 were Hybrid and other kinds, and of all these 49,956 kilos. were root bark.

QUININE.

A quiet week, which began with an easier tendency at first, but latterly, any business which transpired in second-hands was done at 1s. 4d. per oz., spot, and 1s. 4½d. August. It is thought the August speculators have oversold themselves, and this opinion seemed to get a little backing from an advertisement in a daily which asked, "Will all genuine holders of "spot" communicate with "Finance?" To-day further business has been done in August at 1s. 4¼d. and October at 1s. 4⅝d. Manufacturers are firm and busy.

(Average for all India 7·91d.) *June 16th.*

Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittance should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 21st instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

THE RUPEE.

The report of the Indian Currency Committee has made its appearance, and its general tenor is shown by the statement that it recommends a gold standard with the sovereign as legal tender, and the rupee fixed at 16*d*. As usual with such reports, it has an appearance of thoroughness. From a history of the monetary system of India, it passes to a discussion of the silver standard and the probable effects of the re-opening of the Mints. Such a re-opening, it is remarked, would be so fully and immediately discounted as to defeat the objects of such a course. Discussing the fears of the Indian Tea Industry being threatened by China producing on a silver basis, the Committee considers that the permanent interests of the industry would be promoted if worked under the same standard of value as the countries to which its produce is exported. The Report concurs in the decision of the Government not to revert to the silver standard. Having thus had a peep into futurity to consider probabilities or possibilities, the Committee relapses into a consideration of things past and current, and argues in favour of a gold standard. Its opinions on this point, as summarised by Baron Reuter, are delightfully vague. "It is impossible," we read, "to maintain the *status quo*

permanently, though it might prove adequate to create a margin of gold sufficient to tide India over adverse years." Whether the "*status quo*" is, in this instance, a euphemism for "a 1*s.* 4*d.* rupee" is not clear. However, the Committee advises that steps be taken to avoid all possibility of doubt as to the determination not to revert to a silver standard and to proceed with the measures for the effective establishment of a gold standard. Certain proposals of the Indian Government are next discussed and—dismissed. The Report then deals with the schemes for establishing a gold standard without a gold currency. The Committee considers that the Native habit of hoarding gold does not justify a permanent refusal to allow India a gold currency, and it favours making the British sovereign legal tender and a current coin. It considers that the Indian Mints should coin gold unrestrictedly on the same terms as the Australians Mints. Dealing with convertibility, it says that existing conditions prevent the limiting of the amount for which rupees should be legal tender. For some time to come the Indian Government should not be legally bound to part with gold in exchange for rupees, but should make gold available for foreign remittances, whenever exchange falls below specie point. The exclusive right to rupee coinage must remain vested in Government, and the profits should be kept in gold as a special reserve.

Six sections of the Report are occupied in the above wanderings up hill and down dale. The seventh section brings us to the real point of the Report, for it recommends a legal sterling rate of sixteen-pence for the rupee. Up to this point the members of the Committee would seem to have been of one mind. They have written a common history, a common dissertation on probabilities, a common criticism of methods and schemes proposed by others. But, though they have travelled along the same highways and bye-ways, they do not arrive at the same destination, for with the seventh section their unanimity vanishes. The recommendation as to the establishment of a sixteen-penny rupee is not made unanimously, but by a majority of the Committee, who point out that "this is now the normal rate to which prices may be assumed to have adjusted themselves." Finally, in section 8, it is observed that the effective establishment of a gold standard is of paramount importance to the material interests of India not only to promote existing trade, but to encourage the influx of capital. For the speedy attainment of this object, it is eminently desirable that the Government of India should husband its resources and exercise a resolute economy in order to restrict the growth of gold obligations. There, at least, unanimity reigns again; but we must not conclude our reference to this Report without stating that, in an Appendix, Mr. CAMPBELL, General Manager of the National Bank of India, Limited, London, and Sir JOHN MUIR favour 15*d.* for the rupee. Mr. HOLLAND prefers awaiting further experience before fixing the rate. Mr. HAMBRO recommends the creation of a Bank on the lines of the Bank of England. Messrs. CAMPBELL and HOLLAND and Sir JOHN MUIR oppose sterling borrowing for the establishment or maintenance of a gold standard.

The space at our disposal will not admit of more than a cursory remark on "findings" that we have thought it right to give at some length. Further, any remarks we make must be taken as made on these findings as stated by REUTER, and we confess to a doubt as to whether his summary conveys a fair idea of the Report. It certainly makes it appear that the Report is simply an attempt to establish a predetermined conclusion; and it is curious that the summary contains never a reference to any consideration of the interests of India—the peoples, as distinct from the Government. It is a well known fact that low exchange means, or has meant under past conditions, financial embarrassment to the Government of India. But has it meant the same to the people? As an agricultural country, India should devote chief attention to the products of her soil. Are the interests of these best served by bolstering the rupee up, or by letting it take its course uncontrolled by artificial restraints? These are points that do not seem to have been discussed by the Committee, though they were clearly present to the mental vision of Sir JOHN MUIR and Messrs. CAMPBELL and HOLLAND, who did not approve of the sixteen-penny rupee. On these and other points, we shall have more to say in a future issue.

TEA FROM SEED TO CUP IN SOUTHERN INDIA.

(BY THOMAS BROWN, GLENDALE, COONOOR.)

V.

Temporary Lines.—These are usually 10 × 10 per room and are put up by contract at Rs.10 per hut. Should, however, a flat piece of ground not be available, some additional cost for excavation will be incurred, which has not been provided for in the estimate. The walls are made by intertwining thin pliable sticks, and plastering over with mud, the whole being finished when dry with a mixture of clay and cow-dung. The slope of the roof in these huts is generally incorrect. To get the correct slope, insist on the centre poles being just 5 feet longer than those of the sides. Your roof will then have an angle of 45°. Most temporary lines leak from want of attention to this point, and need constant re-thatching as the result. We have known temporary lines last twenty years when carefully constructed and constantly occupied! No door frames or shutters have been estimated for, as these can be of wicker-work, but should it be deemed advisable to have them, and good wood, that will be free from the attacks of white ants, is to be had on the place, they can be made up, and utilized hereafter in the permanent lines. The following pieces of wood will be required for each door 2′ × 2′ 5″ (inside) :—

	Rs.	A.	P.
18-feet rafters in 9-feet lengths 4 in. by 3 in. cost ...	0	12	0
16-feet planking in 5 feet 4 in. lengths 12 in. by 1 in. cost	1	0	0
Carpenter hire per door	2	4	0
Total cost Rs. ...	4	0	0

Hinges and bolt, say, 8 annas extra.

The cost of sawing up the timber alone has been here estimated for. At lower elevations vengay, black wood and teak are often available, and at upper ones jumboo and cedar. The jumboo is known as the *Nagamurrum* and the cedars as *Kilinjee* and *Kulkilinjee*. Blue gum wood, where available, is largely used; but the trees must be fairly old, say, 25 years at least, to be worth sawing up. This wood is quite useless, as planks and can be used for rafters only. Excellent shutters at the same cost for carpenter can be made with teak or vengay scantlings 2 × 1½ in. and kerosine oil cases. They are both light and efficient and do not strain the hinges as heavy jungle

woods do. Davidson's Sirocco packing cases make excellent shutters.

Sawing Timber.—This work is done by specially trained men at from 25 to 40 square feet of saw cuts, or at the rate of 2 cubic feet for rafters and 1½ cubic feet for planks. Scantlings are cut at Rs.12-8-0 per hundred. The usual sizes are—

Rafters ...	...	12 ft. × 4″ × 3″	= 1 cubic foot.
Do. ...	...	12 „ × 5″ × 2½″	= „
Half rafters ...	...	12 „ × 3″ × 2″	= ½ „
Do ...	...	12 „ × 2½″ × 2½″	= ½ „
Planks ...	...	12 „ × 1ft. × 1″	= 1 „
Scantlings ...	...	12 „ × 2½″ × ½″	= 10 to a cubic foot.

Sawyers are very inclined to cut less than the required dimensions, and much sagging of roofs is the result. Saw cuts are determined as follows:—1 rafter 12 feet × 4″ × 3″ = 12 × $\frac{1}{12}$ = square feet and each cubic foot of timber carries about 1 foot on the average of slab cut, so that the above may be taken as 8 square feet. To determine the number of cubic feet of timber in a log, multiply the square of the diameter by ·7854 which will give the area, then by the length for cubic contents. *Example.*—Required cubic contents of a log 24 feet long and 3 feet in diameter—

Area = 3 × 3 × ·7854 = 7·0686.
Cubic contents = 7·0686 × 24 = 169·64464 cubic feet.

It will be as well to have timber cut up and rafters stored for the future, but care must be taken to preserve them from the attacks of white ants! The sawing up of timber is done much more cheaply at Calicut and Cochin than on plantations. In the case of scantlings, which are readily cut from slabs by a bench saw, good teak or benteak ones can be purchased as cheaply, as sawyers will cut up jungle wood, for Badaga sawyers are exceptionally troublesome to settle with. The Palghat men are far more satisfactory in every way. Just now four whole rafters per rupee are sawn from gum-wood in Coonoor, but when the planter wants work done he must pay almost double! The only way to remedy the evil is to publish full particulars, as we are now striving to do.

Temporary Bungalow.—Any attempt at making a wide structure with a double set of rooms will be disappointing, both on account of the height of the building at the centre that it necessitates (since the gable must be half the height of the width of the structure to secure the correct angle *viz.*, 45°), and also because expensive glass shutters never being used for such, the rooms will be dark. Rooms 12 × 15 will be found suitable, the width of the structure being 12 ft, and three such rooms, covering 45 × 12 or 900 square feet will probably suffice. One and a half measurement must be allowed to secure extra height, strength and depth of thatch, which latter may be put with the roots outwards for the money. The cost will then work out as follows:—

	RS.	A.	P.
900 square feet bungalow @ 15 per 100 ft. ... =	135	0	0
4 Rooms 10 × 10 (out-houses) ... ... =	40	0	0
6 Batten windows 4 × 2½ @ 5 as. per square foot.. =	18	12	0
3 Doors do. 6 × 2½ @ 5 as. .. ... =	14	1	0
4 Do. do. for out-houses, 5 × 2½ @ 5 as. ... =	15	10	0
Cutting level, finishing, etc. ... ... =	26	9	0
Total Rs.	250	0	0

No inside doors will be necessary, as a *purdah* will be found sufficient. One of the three rooms can be divided off to form a bathroom, with a wall that need not go up more than 6 feet and the opening can be closed with a *purdah*. As many vent holes as desired can be left in the walls and some panes of glass can be built in, here and there, for light. Place the doors at the gable ends and not at the sides. See that the side walls are at least 8 feet high. Posts 11 feet and 17 feet long will be needed The 11 feet ones for the side walls and the 17 feet for the centres. Doorways can be cut in after the wattle has been tied on and completed, and before the mud is put on. If a carpenter is willing to undertake the making up of the doors and windows by contract, let him do so at 2 annas per foot or half the rate paid for making up panelled and glass doors and windows. The necessary wood is best cut by a separate man, a sawyer. It is as well always to bear in mind that good Benteak panelled doors and windows can be obtained at Calicut at 8 annas per square foot. The necessary glass, hinges and fittings can all be supplied at 4 annas per foot more. In the face of this, Re.1 to Rs.1-4. per foot is being paid in Coonoor to contractors for 1-inch wood in the shutters instead of 1⅛, the safe size to use to prevent warping and springing.

BRAZILIAN EXCHANGE.

The following statistics of Brazilian Exchange may interest our readers and prove useful for reference :—

I.—Extreme Rates of Exchange between 1856 and 1897.

THE CEYLON TEA MAKERS' HAND-BOOK.

In this little book Mr. Geo. Thornton Pett has laid down a set of general rules for the guidance of tea-makers. He does not pretend to teach tea-making to experienced planters, but aims simply at supplying a handy book for the tea-maker. He gives general rules as to the duties of makers, withering and rolling, roll-breaker, sorting room and firing coolies, engine drivers and watchmen. Withering naturally comes in for a fair amount of remark, and rolling, fermenting, firing, sorting and tasting, bulking, and packing are all referred to. Useful remarks on machinery, &c., are also given, and the young planter is affroded an opportunity of acquiring a very fair general idea of the work before him The book should be useful to more experienced planters also, as a handy book of reference on occasions of momentary doubt, and also as a stimulus to thought and, perhaps, experiment. Tea-machinists are constantly striving to invent "something better." Tea-makers should follow this excellent example, and always be trying to improve their methods and the results. To compare Indian methods, or those of Ceylon, with the "old-fashioned Chinese system," would be conisdered ridiculous now-a-days; but there is still ample room for useful comparisons between the processes in favour with different tea-makers If Mr. Pett's little book does no more than make planting readers compare their own methods with his, thoughtfully and with a view to the adoption or continuance of the better, it will serve a very useful purpose. The wise tea-planter is the man who realises that even a lifetime of experience and study should not lead him to believe that he knows "all about Tea."

JAPANESE TEA.

The total export of tea from Yokohama, according to the Customs Tea Returns for 1898, was 26,325,548 lbs., valued at 550,166 lbs., as compared with 26,518,298 lbs., valued at 512,922 lbs. for the previous year. The distribution of the exports to foreign countries, according to the returns of the Yokohama Chamber of Commerce, is shown in the following table:—

	Quantity.	
	1898.	1897.
	lbs.	lbs.
New York and Eastern States of America ..	6,702,964	8,178,814
Chicago and Western States of America ...	8,001,976	8,900.269
Pacific Coast	3,350,544	4,221,794
Canada	7,622.917	5.664,339
Europe, &c.	615,257	301,203
Total...	26,293.658	27,266,419

The above table, as the British Counsul at Yokohama observes, clearly shows the effect of the duty of 10c gold (5d.) which was imposed upon tea imported into the United States after June 14. A certain amount of speculation resulted from the uncertainty of the exact date on which the duty would be imposed, and buying was conducted pretty freely in the hope of getting the tea into America in time to escape the new duty. The announcement of t date had the effect of causing buyers to hold off for t time being, and prices declined 4 to 5 yen per pic (8s. 2d. to 10s. 2½d. per 133 lbs.) The new Restriction A preventing the importation of inferior teas into the Unit States continues to be strictly enforced, and many reje tions have been made. Common teas have therefore most found their way into Canada, which has not yet adopt a similar Act. During the year the quantity of both c and leaf, especially the former, was very satisfactory. T Consul further remarks:—From the beginning of the ye till the opening of the market for new teas at the end April, there was hardly any business transacted. Ear in May arrivals began to pour in freely, and the mark opened at prices averaging fully 15 per cent higher tha last year. The levying of the duty in America has had very bad effect on the trade in general; orders of conside able magnitude were cancelled in consequence, and stagn tion in trade set in. The bulk of the new season's te are still to be disposed of, and as stocks will be augmente by arrivals within the next few months of 1899 teas, t outlook is not very encouraging. The cost of labour a material, &c., for tea firing has greatly advanced, as co pared with previous seasons, and. curiously enough, spite of the imposition of the American duty, the pric paid to the Japanese for teas have also advanced.

CEYLON EXPORTS IN 1898.

Ceylon Customs Returns show that the exports of tea Russia and the United States rose in 1898 by 2,084,437 lb and 1,093,896 lbs., respectively. The direct exports Russia of Ceylon produce were valued in 1897 at R241,1 and in 1898 at R2,406,770. The rise in the value exports of Ceylon produce to the United States of Ameri in 1898 as compared with 1897 was from R2,965,553 R5,283,632 In the staple articles of export, cardamo show a small decrease as compared with 1897, but increase of 83,176 lbs. as compared with 1896. The quanti of cinnamon has risen from 3,182,823 lbs in 1896 a 3,850,005 lbs. in 1897 to 4,281,165 lbs. in 1898. Of t total value of Ceylon produce exported, the products of t cocoanut tree represent nearly 23 per cent.

The following table shows the quantity and value coffee, cacao, cinchona and tea exported—

		Quantity.	Value.		
		Cwt.	R.		Decrea
Coffee ...	1897 ...	18,604	1,472,246	cwt.	5,4
	1898 ...	12,692	878,693	R.	593,5

THE MANUFACTURE OF PERFUMES.

Since it was announced that the experimental manufacture of Attar of Roses was being taken in hand in the Wynaad, interest has been manifested in the methods of manufacture. Even with respect to roses, widely different systems of preparing the attar are adopted in different countries. They range from primitive infusion to scientific distillation. As regards perfumes generally, however, modern methods may be roughly classified under four heads—the mechanical process, distillation, maceration and enfleurage. The application of mechanical means for the extraction of essential oils is accomplished in various ways, and is mostly used in the treatment of the citrus fruits (orange, lemon, &c.,) which are considerable in bulk and contain oil in comparatively large quantities. One process consists simply in expression, the material being put into a press and subjected to heavy pressure. Another is to rub the fruit in a metal cup lined with spikes (ecuelle à piquer,) the oil settling into a hollow handle, whence it is at length poured. An ecuelle on a large scale, consisting of a drum lined with spikes, is also used. Another method consists in squeezing in the fingers sections of the peel turned inside out, and taking up the oil with a sponge. The second mode mentioned, *viz*, distillation, differs in no essential respect from the methods already in use for the extraction of oil of peppermint, sweet birch, sassafras, etc. Of course an oil which is worth 25*s*. or 30*s*. an ounce demands finer apparatus and greater care than oil not worth that much per pound. Further, it must not be assumed that all forms of still are equally good. The absolutely necessary parts of a still are, first, a boiler in which the material is placed with water; second, some means of supplying heat, preferably steam applied in a steam jacket, but frequently merely a fireplace under the boiler; third, a worm of some equivalent form of tubing, immersed in cold water or otherwise cooled, to condense the steam; fourth, some kind of a receiver in which the condensed oil and water may be allowed to separate. Distillation is available for a large number of plants, but not for all. The third method, that of maceration, is one in which flowers are immersed in melted grease, the charge being renewed ten or fifteen times, at intervals of twelve to forty-eight hours. The product is either used as pomade, or digested in alcohol, which takes up the perfume, making an extract. Lard and tallow thoroughly purified are used; also the fat of the deer. To make perfumed oils, olive oil is substituted for the fat. The fourth method is that of enfleurage or inflowering or absorption, in which the flowers are placed on thin layers of grease spread on panes of glass in frames, the flowers being renewed from day to day. To obtain perfumed oils, coarse cotton cloths saturated with olive oil and laid on frames with wire gauze instead of glass are used. Enfleurage is the most delicate of the methods to operate and gives the finest results. By the two last methods the odour obtained is nearly that of the living flower; that secured by distillation is often as different as if it came from another plant. It should also be mentioned that various chemical processes for the extraction of perfumes have been proposed, though they have not hitherto superseded the methods described to any great extent.

TEA AND COFFEE IN THE UNITED STATES.

The following statistics of the consumption of tea and coffee in the United States, per capita of population 1870 to 1898, have been prepared by the Bureau of Statistics, Treasury Department. They should be of interest to our readers.

Year ending June 30.	Tea. lbs.	Coffee. lbs.	Year ending June 30.	Tea. lbs.	Coffee. lbs.
1870	1·10	6·00	1885	1·18	9·60

NOTES.

Vanilla in South Sylhet. A correspondent of the *Planter* says that it is now conclusively proved that vanilla will flourish and fruit there.

Ginger. Planters should give an eye to this product. A Home contemporary looks forward to a considerable advance in prices, amounting, in fact, to "a revolution in the market."

Coffee in the United States. Average imports about 800,000,000 lbs. which represents over 1,300,000,000 gals. Coffee is *par excellence* the national beverage of the States.

Japan Tea. The United States and Canada continue to buy freely, and if the opportunities for making purchases at Calcutta are lessened there will be an inevitable "set back" for Indian sorts in those markets.

Rejected Tea in the U. S. During May 8,602 packages of tea aggregating 347,874 lbs. were rejected by the inspectors at New York. There was not one pound of either Indian or Ceylon tea among the rejected, although 1,879 packages of 107,519 lbs. of these teas were passed.

Tea "Fluff." Fears having been entertained that tea "fluff" exported for dyeing purposes and for conversion into caffeine might be passed off as "Tea," Messrs. Ch. & A. Boehringer have written to the *Ceylon Observer* stating that considerable quantities of tea "fluff" are shipped by them in bales, not chests or cases, to be manufactured into caffeine.

A Tea Inebriate. Thirty cups of tea a day was the habit of a man who died lately in America. As the *American Grocer* remarks, that man was as much of a suicide as though he had blown his brain out with a pistol. He preferred a lingering to a sudden death. Bread and milk, or many another harmless article, will threaten life if used to excess, but if used in moderation will enhance life.

Moss on Coffee Trees. A correspondent writes us:—"Is moss growing on the stems of old coffee trees, an evil or beneficial; if the former, what is the best and cheapest method to adopt to remove the moss? I find moss growing on my coffee trees and am at a loss to know whether to remove or leave same." Perhaps some of our readers can oblige with information on these points.

Colombo Tea Sales. At the public sales of tea at Colombo on the 5th instant about 9,143 pkgs. = 713,902 lbs. were offered, of which about 7,657 pkgs. = 598,068 lbs. were sold. The sale passed with a very firm tone at about previous rates for all grades, except medium broken pekoes, which were somewhat neglected. Among the best teas in the sale, says the *Times of India*, were Strathespey, High Forest, Tonacombe, Queensland, Mocha, and St Johns.

Nilgiri Planters' Association. A General Meeting of the Nilgiri Planters' Association will be held at the Masonic Hall, Ootacamund, on Friday, August 4th, at 11 a.m. *Business.*—Consider subjects to be brought up at United Planters' Association meeting and instruct delegates. *General Business.*—Members are requested to give the Honorary Secretary due notice of any subjects for discussion or resolutions which they may wish to bring forward.

The Paris Exhibition. In response to representatio from the Indian Tea Associatio and with a view to assist that body to effective represent tion of the tea industry at the Paris Exhibition, the Go ernment of India have agreed to meet any expenditu falling against the undermentioned heads of the Associ tion's estimate within the limit of a sum of £3,250:—(Open air space and royalty. (2) Space in courts and royalt (3) Decorating and furnishing. (4) Carved wood scree and also to pay a sum of £750 towards other expenses.

Tea Making. A Northern India Planter write —Withering space, more witherin space, is the cry of the tea-house man, at his wits end to kno where to spread his drenched leaf. Until those responsib for the equipment of factories are brought to see that tea house is not *complete*, unless it has *ample witherin accommodation to meet all possible exigencies*, the conundrur "how to make good tea under adverse circumstances, will ever remain unanswered. This I write advisedly, fo we have at present no machine that will *simply with* leaf without either baking. stewing, bruising, or discolou ing it.

Pepper in the United States Steadily rising prices and dimin ishing supplies are reported. Th *American Grocer* points out that th new Singapore plants were put out only the year befor last; therefore, it will not be until 1900 that the possibilit exists of a crop from the young vines. The old plantation are declining, and each season give less and less suppl Present stocks will be largely drawn upon; in fact, it is serious question whether the prospective supply will satisf the demand until the new plantations begin to yield. Ou West Coast friends should have an eye on the America market.

Tea Prospects in Assam. *Capital* says:—In the Cach District, although some rain fe during last week, the prospects the tea crop are generally good, although mosquito bligh is still prevalent. In the Sylhet district the want of sun still affecting the manufacture of tea injuriously, and th weather continues wet and cloudy, and floods are prevalen throughout the district and have caused considerabl damage to crops. Rain continues to fall in the Kamrup Darrang, Sibsaugor and Lakhimpur districts. and it is alt gether too cold and wet, for tea blight is also prevalent i Kamrup.

Labrador Tea. This article, of which a *bale* w shown in London recently, is de scribed as consisting of the branches of *Ledum latifolium* a small shrubby plant of the heath family, found in swamp situations in Canada and the Northern United States. Thi plant, which is also known under the name of "wil rosemary," was introduced into England as an orn mental plant so long ago as 1763. The leaves, which hav an agreeable odour and taste, are linear-oblong in form and clothed on the under-surface with a rusty tomentum and have pectoral and tonic properties. The Cree Indian

employ them as tea, and know the plant under the name "Maskoego;" they were also similarly used during the War of Independence.

Hope still! The *American Grocer* says:—"The coffee supply for the season 1899-1900 will be half a million or more bags larger than for 1898-99. Some day there will come a sudden rebound in prices." The connection between the first remark and the second is not clear, but the sanguine will excuse that. There is no doubt that in America present low prices have greatly stimulated consumption and created an active demand for low grades, which are selling at unremunerative prices to the producers. Still, it hardly follows that there is truth in the assertion of a leading importer that if the present demand continues, there will be a considerable reduction in the world's visible supply, which would be felt thoroughout the country, where stocks at present are comparatively small. We take what little comfort we can from the same gentleman's expression of a belief that "rock bottom has been reached so far as prices are concerned." May these "hard times" soon pass away.

Coffee in the United States. The *American Grocer* observes:—"Samples of cheap package coffee are being distributed to Housekeepers in Brooklyn. That ought to stimulate the demand for fine roasted coffee, as the contrast between a 10-cent and a 35-cent coffee will be so thoroughly demonstrated that every lover of the beverage will seek quality regardless of price." There is said to be an increasing tendency on the part of wholesale men to buy medium grades at present low prices, to hold. Buyers seem to have confidence in present values, but the low grades continue to absorb the interest of the trade. There is a strong belief that the war between the big coffee roasters has injured the entire trade; that it will not have a speedy end, but will wear itself out. Time alone, says one importer, will be able to adjust the coffee market to its normal condition. Low grades form the bulk of the sales, so that high grades are neglected. Medium grades have suffered since the break in prices, and are substituted for lower-priced coffee.

Crop Estimates in Brazil. A New York newspaper man lately remarked:—"Brazil crop rumours in late years have been mostly false, and the trade ought to show their resentment of tactics which are all wrong. It seems likely that the marketing of the crop in Brazil will keep upon a free scale for the balance of this season, and there is no use denying there is another large crop to come after it. Although consumption of coffee at lower values is greater than ever, this is no reason why the Brazilians should wish to deceive us about the extent of their crops, and an important point for them to remember is that every hole and corner is filled with coffee to a degree never known before." *Apropos* of this, we may state that a Rio contemporary, which is probably the best informed on trade topics, frankly confesses "in spite of all our efforts to come to positive conclusions, we have so far been able to formulate none, nor do we believe that anyone else possesses the indispensable elements to estimate the coming crop within a million bags or so."

Tea in Persia. Reporting on the trade of Azerbaijan in 1898, Mr. Consul-General C. G. Wood says:—It may be of interest to know that tea, which is the principal drink of the Persians, comes almost solely from Calcutta. 20,000 chests are annually imported into Azerbaijan from Calcutta *viâ* Trebizond, whence a part is distributed to Teheran and other places. Natives alone import these teas, upon which they pay 5 per cent. customs duty, besides some 5 per cent. more in fees and gifts to custom officers in these parts These teas are distinguished according to quality and price by the following local names:—

"Shahi" Nos. 1 and 2, mediocre quality, from 2 to 4 krans per 1 lb.
"Kalami," so-called owing to its being a thicker and longer leaf, ordinary quality, 3 to 3¼ krans per 1 lb.
"Agh Par" (feather like), so-called owing to its being interespersed with white or greyish leaves; considered best quality, 4 to 5 krans per 1 lb.
"Telaye" (golden), 4 krans per 1lb.

Indian tea is imported in bulk in 80 to 100 lbs. chests, zinc or lead, paper-lined. But little Russian "Caravan" tea is used owing to its high price.

The China Tea Trade. The following are the season's comparisons from the *China Overland Trade Report* of June 24th. There has been a considerable increase in shipments to the United Kingdom, it will be observed:

Export of Tea from China to United Kingdom and Continent.

	1899-1900.	1898-99.
	lbs.	lbs.
	7,251,094	4,517,174

Export of Tea from China to United States and Canada.

	1899-1900.	1898-99.

"Adulterated" Tea. In the House of Commons recently Mr. Carew asked the Financial Secretary to the Treasury whether he was aware that large importations of tea rejected by the Hamburg and New York Customs had recently been passed by the English Customs, and sold in London, although containing up to 20 per cent. of clay and sand, and unfit for human consumption; and whether, in view of the fact that the price of common teas, of which the poor were the largest consumers, had advanced 50 per cent., the Government would insist on a more rigid inspection of all future importations to prevent a repetition of the fraud. Mr. Hanbury replied: The Board of Customs have no means of testing the accuracy of the statement in the first paragraph. As was stated yesterday by my Right Hon. friend the Chancellor of the Exchequer, in reply to a similar question, a full inquiry is being made, and if it should appear advisable to alter the existing regulations or to increase the number of tea in-

spectors the necessary steps will be taken at once. Meantime a circular has been issued to the tea inspectors directing them to administer the existing regulations with special care.

Bonus Tea.

Mr. A. G. Giles writes in his "Notes on Trade Topics" in the *Grocer*:—Writing of tea reminds me that the interest in the "bonus" tea question is growing stronger, especially as it is now known who is supplying some of this tea to the men who are carrying on the trade which is the subject of consideration by high legal authorities. Whilst the matter is *sub judice* it would not, of course, be wise to give any names; at the same time it is to be hoped that presently the retail trade will learn who is backing up a system which is proving so damaging to the ordinary retail grocer. One thing is clear, that the "fancy" methods of pushing the tea trade ought to be very carefully watched, and any plan which is not in accordance with the law of the land should be promptly dealt with. Every retailer should at once bring to light any novel method which savours of being suspicious in order that it may be investigated. There can be no doubt that a grocer's tea trade is a most important part of his business, and any interference with it cannot be regarded with indifference, hence the interest now being taken in the end-of-the-century novelties which are being introduced.

The American Tea Market.

Asked for an opinion on the American tea market, Mr. A. R. Robertson lately said: "Since the imposition of a duty on tea, and the establishment of standards for purity, the general nature of the business, has somewhat changed, as buyers, instead of investing their money in duty, make their purchases more frequently, trading in a "hand to mouth" fashion. At the same time, for the Spring season, the markets abroad for black teas, were much higher, than in some years past, the result being that very little tea of any kind could be bought on this market under 24 to 25c, and even now, although business is slow, there is little disposition to cut prices, or force sales at a reduction, unless special instructions have been given for the closing of consignments. The position of the tea market to-day, should be satisfactory to all holders, as the number of rejections by the Appraiser of the Port of New York, have kept out a large quantity of teas of questionable value, and owing to the immense stock, which was put on the market last summer and early fall, being now cleared up, there is quite room for the trade to carry a reasonable amount of stock, without affecting the business in any way, and the possibilities are that inside of a couple of months we shall see more activity, possibly with firmer prices."

The Hankow Tea Market.

Advices dated June 15th, state:—Arrivals of first crop tea during the week amount to 14,000 half-chests, and, as hardly any more is expected, the excess in this year's yield may be reckoned at 30,000 half-chests. The stock, as given below, is somewhat misleading, as in our statistics we deal with teas as officially reported; but there is a large quantity settled that has yet to be "called out." We estimate the unsold Hankow teas at 25,000 half-chests, consisting of head-cho Onfaas, Chong-sow-kais, and Yung-low-toongs, partly u desirable parcels and partly teas that missed their mark owing to the obstinacy of holders. In Kewking teas the is nothing left but 4,000 half-chests Ningchows, main first-chops of unattractive character. Common te continue in demand at firm rates, and at Tls. 11 quality very poor, consisting of brownish, broken, chaffy leaf, an infusion looks as if the tea was mixed with last yea third crop. *Second Crops.*—A few chops have arrived fro the Yung-low-toong district, and two parcels have be taken at Tls. 16¾ and Tls. 17, being about two taels high than last season. Quality is fully up to last year; lea liquor, and infusion are satisfactory for this class of te and the general character of these early samples sugge favourable conditions at time of picking and packing.

A Madagascar Rubber-Tree.

M. Henri Jumelle contributes the *Comptes Rendus* for May 29, paper on the Guidroa, a rubber-tr of Madagascar. The writer mentions that the plant h hitherto been known only under its native name, but th now, thanks to specimens sent from Suberbieville (!) M. Périer de la Bathié, it has been possible to ascerta whether it is a new species, or can be identified with an that is already known. The conclusion arrived at is, th the Guidroa, though clearly belonging to the Mascarenhas genus, does not exactly resemble either of the fifteen sixteen known species, but may be held to be a new specie and may be named *Mascarenhasia velutina*, in allusion the very characteristic velvety substance of the leave M. Jumelle describes the manner in which the rubber gathered from the trees by the Sakalaves. During the d season, when the milky juice is very thick, they make, says, numerous incisions in the trunks. The milky jui coagulates almost immediately below the wound, formin small bands of gum which the workers remove after a hour, and which they agglomerate into balls. In this wa one man can easily gather a kilogram of the gum one da The caoutchouc thus obtained is of good quality, an even, it appears, superior to that gained by ebullitio Thus it seems likely that the Mascarenhasia genus, on found on the east side of Africa and in Madagasc (especially in the north and east), will play a more impor ant part in furnishing caoutchouc plants than has pr viously been thought likely.

GENERAL ARTICLES.

HYBRIDIZATION AND CROSS-BREEDING.

Mr. J. Cameron, Superintendent, Government Gardens, Myso writes to *Indian Gardening*:—Adverting to the opinion openly expr sed by a writer in *The Garden*, that "Gardeners in tropical countri do not appear to make much use of the exceptional advantag they enjoy for cross-breeding and otherwise improving and addin to garden plants," I would like to say a few words in addition what you have already said in your leader of Thursday's issue. am not, of course, in a position to speak of what is done in tropic countries generally. But within my own sphere of action in Myso some results have been obtained by crossing the flowers of alli species and varieties.

As you have pointed out, the onerous and varied duties of an o cial appointment do not leave one much time for conducting p tracted experiments of the kind; and, personally, it is very dou

ul if I have ever raised a new variety of plant. Others, however, ook their cue from my early endeavours in this direction, and I ave now one or two clever native assistants who have raised many ew varieties, and understand the process of crossing thoroughly. The new plants mostly produced in the Palace gardens here by Venkataswami Raju are seedlings of *Dracæna, Codiæum, Dahlia, Coleus*, and several annuals. In the Botanical Gardens, several new varieties of *Carica* have been raised and without cross-fertilization such plants as *Amaryllis* do not produce seed here. For several years past attempts are being made to produce a good coffee hybrid, and if we have not yet succeeded, it is not for want of trial or advice on the subject.

I do not mention the above experiments in a boastful spirit, but with the object of showing that gardeners in the tropics are perhaps not so backward in their craft as would at first appear from *The Garden* writer's statement.

Having no Royal Society to award certificates or medals, nor a rigorous horticultural trade to derive benefit from the production of new forms—in many instances overdone—it is true that our productions are not proclaimed on the mountain-tops. In India the raising of hybrids and varieties is more a matter of pleasure than speculation at the present time. It is a work that would suit the native gardener well, possessed as he is with a delicate touch and great patience.

His methods are at first of a rough-and-ready order: he gathers the plants he wishes to operate upon as near to each other as possible, so that their flowers shall intermingle "and marry" (as he quaintly puts it). At other times he thrusts the flowering branch of one plant into the inflorescence of another to effect some improvement in the fruit or seed. These are things which the natives knew long before we joined them, and are possibly the remnants of scientific practice in former ages. I shall be glad to hear when fuller enquiry has been made that Indian gardeners, at least, are able to repudiate the serious charges made against them and others by *The Garden* correspondent.

COFFEE IN JAVA.

The Java correspondent of the *Singapore Free Press* writes:—

Coffee in Java appears to be in a bad way. In the *Algemeene Handelsblad* there is a plea for the suffering industry. Leaf disease, caterpillars, etc., etc., go to certify that the coffee tree in Java is greatly fallen off in growth, strength, life. and productive power. And then comes the great fall in prices caused by the astonishing increase in the Brazilian production. The coffee interests in Java have drawn the attention of the Minister of Colonies to the unbearable state of things. and after reading it the *Handelsblad* is obliged to confess that it entirely agrees with their statement that private coffee-growing stands on the edge of going under and is threatened with total destruction. The planters have done much to repair the disaster. An experimental garden has been put to work at Buitenzorg, they have striven to reduce the cost of production, grown Liberian coffee and grafted Java trees on Liberia, but mainly by the fall in prices of late years these measures seem to be insufficient, and it will seem more and more impossible to carry on most of the coffee estates. The petition to the Minister of Colonies gives some sad figures. Bandarangan cost 297,000fl., the shareholders have never got a cent, and after six years of existence an attempt to sell the concern did not obtain one bid. Tjelung 210,000fl. In eleven years of full production the shareholders have had one dividend of 5 per cent., and the highest bid at a sale in 1896 was 1,000fl. Wonokitri cost 680,000fl. and in nine years of full production the shareholders have received a total of 19 per cent. Six other Companies are given with similar results. There are of course exceptions and estates can be pointed out which in normal times have paid well, but in general it is certain that the investors would have done better in Government securities. All this leads up to a demand that the tax-gatherer shall moderate his demands, and the State railways come down in their demand for freight, to save a perishing industry. The export duty must in the first place cease. Its being levied at all cannot be defended. The charges on the land and holding-rights are shown to be monstrous. The Government gets yearly ¾ per cent. of the value of the estate, and his value is placed at a ridiculously high rate, and estates are thus unjustly burdened. Sales, voluntary and forced, continually prove that the Government estimate on which the levy is made exceeds the real value by any number of thousands. The railway again bases its charges on the value of the goods carried. Now that coffee prices have fallen 40 per cent. the railway charges should be reduced *pro rata*, but they are not. As is to be expected, in the present condition of Dutch Colonial finances, the Minister does not receive the petition at all kindly. He does not see why a bad year should take away from the Treasury receipts for the future. But this is no case of one year. Figures for ten years and for the industry taken over all would prove the contrary, and the *Handelsblad* demands reform to prevent the ruin of a great industry and the frightening away of timid capital.

DEATH OF THE CEYLON PLANTER WHO UNEXPECTEDLY GAINED A FORTUNE.

"A LUCKY CHEST OF TEA."

"Old Colonist," writing from Home to the local *Observer*, comments on a paragraph which appeared a little more than a year ago under the heading "A Lucky Chest of Tea," telling how a planter at home on furlough, finding fishing on the Don very slow, resolved to call upon a proprietor in the immediate neighbourhood, a sort of second or third cousin of his own, but an old recluse, of whom he had been warned that it was useless to call, as he never would see anyone. "Carium illay," said the sturdy planter as he strode up to the front door and handed in his card. Duly the reply came: "My master bids me say he does not receive visitors, but you may have any refreshment." "Well, tell him, with my salaams, I don't want his refreshment," said the indignant *dorai* as he walked off. But he had not got far down the avenue when the servant came running after him, saying, "Master has read your card, and, seeing you come from abroad, would like to speak to you." So back he went to find that the special object the cautious old laird had in view was to get the planter's opinion on a box of tea he had just received "*Good tea*," said the expert as he sniffed at a handful, "but we do make better, and when I return to the estate I will send you a chest of the best tippy tea." Fortunately he did not forget his promise, for the chest arrived in the nick of time, just as the old chap was swithering over his last will and testament, and in the first flush of gratitude down went the name of the planter for the whole estate—some £40,000 cash and a splendid Donside property! "None of your larks," thought the planter when he received the telegram, but second thought convinced him that Aberdeen lawyers didn't usually spend money on practical jokes. So home he went, in middle life, the rich laird of Whitehaugh; and hundreds of fellow-planters exclaimed "LUCKY FELLOW"! Alas! it is needless to envy. A fortnight ago, Mr. Farquharson (who had adopted the name of his benefactor) caught a chill and to-day he lies in the family burying ground, regretted by his tenantry, who had become greatly attached to the kind, enlightened and liberal-minded new laird.—*Times of Ceylon.*

THE FERTILITY OF SOILS.

The factors upon which the fertility of the soil depend are many, says the *Gardeners' Chronicle*. The amount of plant-food and its degree of solubility, the mechanical texture or tilth, and the climate, which includes temperature, amount of rainfall, &c., are the chief of these.

Soils to be fertile must contain the elements of plant-food in such forms that they can be readily used for the nutrition of vegetation. At the same time, its condition must not be too loose, else a firm hold will not be afforded to the roots of plants, and there will be too much drainage and evaporation; nor must it be too heavy and plastic, for then air and water could not freely permeate it, nor the roots extend themselves beyond a very limited area. Generally speaking, light, loose soils are not as rich in plant-food as those in which clay predominates; yet, on account of their excellent condition of tilth, and the ease with which they are worked, they are specially adapted for most horticultural purposes, and having a sufficiency of manure, they often yield in favourable seasons heavier crops than the stronger soils would do. Stiff, heavy clays, though rich in inorganic food, potash, and phosphoric acid, are often poor in nitrogen, while their mechanical condition is such as to prevent thorough aëration and the penetration of the roots. It is these soils

especially that are benefited by drainage. By a system of drainage the water which saturates the surface-soil is carried off, air allowed to permeate, the whole is rendered more friable and easily worked, and much plant-food is converted into assimilable forms.

Where sand largely preponderates, the soil is not retentive of moisture and fertilising material, especially if the subsoil be light, and though easily worked it is not so desirable in very dry seasons as on a heavier soil. A proper proportion of sand and clay, therefore, for many reasons, makes the best soil. With the clay and sand, varying amounts of peaty matter, or humus, derived from the decomposition of vegetable matter may be mixed. In horticulture leaf-mould is largely used. Calcareous matter, chalk, lime, and bone-meal, are usually associated, and a light proportion of these exerts a beneficial influence upon the tilth of the soil, as well as upon the solubility of the plant-food. By the slow decomposition of the clay, the vegetable matter, and the lime, valuable plant-nutrients, are liberated in a soluble form, and therefore the function of these soil constituents is not only mechanical but chemical.

The most important inorganic constituents of a soil are potash and phosphoric acid. These, together with nitrogen, are known as the essential elements of plant-food.

To understand the question of soil-fertility, the gardener should become familiar with these matters, should know what these elements will do for crops and plants, and when and how to apply them.

Nitrogen.—This element, like potash, lime, and phosphoric acid, is an essential constituent of all plants. In its free state it is a permanent gas, and is one of the most widely distributed elements, comprising about four-fifths of the earth's atmosphere. This vast supply of nitrogen is, however, of no direct value to plants, since they are unable to use it, except when combined with the elements oxygen or hydrogen, forming nitric acid and ammonia, that may be taken up through the roots of plants. Leguminous plants, like Peas, Beans, Lupins, &c., and possibly Orchids, are indirectly able to build up their nitrogenous ingredients from the free nitrogen of the air, through the activities of microscopic plants (known as bacteria), intimately associated with them; other plants may, possibly, under favourable conditions to some extent have the same faculty.

Nitrogen is present in the soil in simple combinations as nitrates or ammonia salts, or as more complex organic compounds, forming the dark coloured humus especially abundant in peat, leaf-mould, and forest soils. The total quantity of nitrogen in ordinary good soils varies between 0·1 and 0·2 per cent.; occasionally the nitrogen content will approach one per cent., as in the case of rich pasture soils. Peat soils will often contain over two per cent. of nitrogen; this is, however, largely in a combination that will not directly sustain plant life, but has to undergo a weathering process before the plant can make use of it.

Nitrogenous manures help to strengthen plants in their earlier growth, favour leaf development, and give a deep green healthy colour to the foliage; applied in excessive quantities they induce rank growth at the expense of the development of the fruit.

Phosphoric acid is present in soils in combination with a number of other chemical substances, which exert a very beneficial influence on the growth of plants. Phosphoric acid is found in soils partly in a form that plants can readily dissolve and make use of in the building of their structure, partly in an insoluble form which under the influence of water, carbonic acid and air, or the mineral components of the soil are gradually changed into available plant food. There is only a small quantity of phosphoric acid in ordinary soils, *viz.*, less than 0·2 per cent., and often only 0·05 per cent.; but as the content is not decreased in any way except by the growing of crops, the soil will only become deficient in this constituent in case of continuous cropping without manuring.

Phosphoric acid is of special importance in the early life of plants; it stimulates the assimilation of mineral substances in the plant, and favours the development of its root system. There is an intimate relation between the nitrogenous principles and the phosphoric acid in plants, and we find that, generally speaking, a high nitrogen content is accompanied by a high percentage of phosphoric acid. The phosphoric acid of plants is usually concentrated in their maturing organs, the flower and seed.

Potash is found in Nature in combination with acids like sulphuric, carbonic, and silicic acid. Potash is generally distributed small quantities in most soils, except light sandy soils, which apt to be deficient in this fertilising element; it is found in g nary soils in somewhat larger quantities than phosphoric a namely, from one to three-tenths of one per cent., and occasion as much as one per cent. in case of soils originating from gran basaltic, and other rocks rich in potash. Like phosphoric a potash may be present in the soil in a non-available form, especi as double silicates, that are but slowly decomposed through action of water, air, and other constituents of the soil.

Potash is found in the largest quantities in foliage plants, leguminous plants, in vines, and in potatos. It is of the great value to plants, in facilitating the flow of sap, and the diffusion starch from cell to cell. It gives increased strength to the structure of plants and has in general a beneficial influence on flavour and texture of fruits and potatos.

Lime is present in most fertile soils in sufficient quantities allow of the production of large crops, but occasionally there be too little of it to reach this end, in which case the addition some lime compound to the soil, will produce very beneficial sults. It is considered that a lime content of one-half of one cent. an ample supply in light soils, while heavy soils may need t per cent. or more

The good effects from the addition of lime to soils do not co only from the increase of an ingredient essential to plant grow but the mechanical condition of the soils, its texture, water a heat-retaining capacity, are improved. This same is true in p haps all cases when fertilisers are applied to soils, a fact which generally overlooked by horticulturists.

THE 1-lb. DRAFT QUESTION.

It is unnecessary to pass more than brief comment at t present stage of the India and Ceylon "Tea Fight," thoug we propose to quote the opinions of some of our contemp raries, besides stating what has occurred since our last iss appeared. In the first place, we may state that there we no sales in Calcutta last week. At the suggestion of t Indian Tea Association in London, sellers refused to off teas for London, and withdraw their teas. Twenty thou and chests were thus taken out of the auction that ha been announced to take place. There was some little di cussion subsequently as to whether Tea should not be offere for *other markets than London.*

The following shows the present position :—

On the 7th instant a telegram was sent from the Indian T Association, Calcutta, to the Indian Tea Association, London, follows :—"Your telegram yesterday; to-day's auction stoppe sellers unanimously support you. but opinions differ as to t advantage of stopping sales at this stage, as disputes with deale must be settled before the teas now offering reach London. Befo holding sales for the outside markets desire full explanation your objects."

The Indian Tea Association, London, on the 11th replied follows :—"Dealers intended buying in Calcutta to force our hand your prompt action had great moral effect. Please continu support."

The Calcutta Tea Association held a meeting on 11th instant discuss this telegram, and passed the following Resolution :—"Th while the tea market is closed to buyers for the United Kingdo sellers be recommended to put up teas at private auctions for t supply of markets other than the United Kingdom." A Secon Resolution was then passed :—"That a Committee of the Calcut Tea Traders' Association be asked to make the necessary arrang ments to give effect to the above Resolution."

A meeting of the Calcutta Tea Traders' Association was the called and the following Resolution passed :—"That the sale shou be held at the Metcalfe Hall at noon to-morrow (Wednesday) allow the purchase of teas for markets other than those of

United Kingdom, all buyers having guaranteed that purchases will not be sent directly or indirectly to the United Kingdom."

In London there was no sale last week. At the Tea-dealers' Meeting on the 4th instant, it was resolved not to attend sales and not to buy Tea privately. It was also decided to convene a Mass Meeting of the Trade to consider further action.

The Congress of the Federated Grocers' Associations adopted a Resolution protesting against the abolition of the 1-lb. draft allowance, and the tea-dealers appointed a permanent Committee to watch developments.

In Colombo there has been a good deal of hesitation shown. The India and Ceylon Joint Committee in London wired out to the Chamber of Commerce :—

Importers Joint Committee urge stop Colombo Auction Sales fortnight allowing private sales other countries Calcutta similarly advised.

The Chamber replied :—

Nothing to complain of local terms nett cash seven days full invoice weight Chamber regrets cannot comply.

All tea owners were also requested to wire London Agents to sell Tea on and after the 17th July without the 1-lb. draft.

The following is a more detailed report on some points of special interest :—

ACTION OF THE CALCUTTA ASSOCIATION.

There was a large attendance on the 7th instant at the Metcalfe Hall, Calcutta, of brokers, dealers, and others interested in the tea industry. Instead of the usual auctions being proceeded with, those present indulged in a lively series of discussions on the situation that had been created by the action of the London dealers. It was understood that a cable had been received from London by the local Association, and that a decision had been arrived at.

The exact position of affairs was explained by Mr. Ashton (Acting Chairman of the Calcutta Tea Association), who, speaking from the auctioneer's desk, said that he did not know whether all present had heard the terms of the message the Tea Association had received that morning. In case anyone had not he would read them. The cable from the London Importers' Joint Committee was as follows :—"Importers' Joint Committee urge stop auction sales fortnight, allowing private sales outside markets only. Colombo similarly addressed." On receipt of that telegram, the Calcutta Committee of the Indian Tea Association met and unanimously adopted the following Resolution :—"That this Committee strongly favours the telegraphed suggestion made by the London Importers' Joint Committee to stop Calcutta auction sales for two weeks, and to sell only for markets other than London privately, and the members agree that the firms they represent will withdraw all teas catalogued for to day's auctions." The Committee, Mr. Ashton remarked, immediately after passing that Resolution went round to see all the selling firms, and, so far as he was advised up to that moment, all the sellers were in favour of withdrawing their tea. That was the situation.

Mr. West said that he took it the Association had no reason to curtail the outside market. One class of tea was required, and this could not be sold for outside markets privately.

Mr. Ashton replied that there was no desire on the part of the sellers to inconvenience any parties' business beyond what they were obliged to do in order to protect themselves against what they considered on unreasonable demand. He should certainly not advise the Association to go back on what they had resolved to do. But if any scheme could be brought forward by which auctions could be held, by which sellers could be perfectly well assured they were not selling for London, they would be quite ready to listen to any such proposal. Personally he did not see how it could be done.

Mr. Carter thought some teas might be offered for Bombay and America as there was a steamer leaving on the 15th for New York. Although Bombay buyers might take 5,000 chests this week they could not take 10,000 next for financial reasons.

Mr. Ashton said it was outside his power: so far as he was himself concerned he had made up his mind to stick to the terms of the Resolution, and his firm's teas would be withdrawn that day. He did not think he would be justified in telling them all that passed at the Tea Association Meeting. He had, he thought, said sufficient in explanation of the reasons that had led them to take up the position they had. With regard to matters of policy, from a seller's point of view, he did not think he would be right in going into the question of shipping or holding. The matter was one for individual firms to settle. So far as his own firm was concerned they would hold their teas in Calcutta. The Association would be meeting again that day and would be pleased to meet representatives of the brokers and buyers to discuss the question of meeting the wishes of the outside market. He announced accordingly that a meeting of the Tea Association would be held at 3 o'clock that afternoon and at 3-30 they would be prepared to confer with representatives appointed by the brokers and buyers.

We understand that a telegram was sent yesterday to Colombo from the Calcutta Association.

CONFERENCE WITH BROKERS.

By arrragement, Messrs. West, Carter and Baines, representing the brokers, and Messrs. Marriott, Yule, and J. W. Lloyd, buyers' delegates, met the Committee of the Indian Tea Association at 3-30 in conference at the Royal Exchange, Mr Ashton presiding. The views of the brokers were expressed, and a Resolution was submitted by them in favour of continuing the auctions as usual to-day in order that teas might be bought for Bombay and other outside markets excluding London. The members of the Association strongly opposed the suggestion, as inconsistent with their previous Resolution. After considerable discussion the Chairman, accepting a proposal, which was assented to by the meeting with one dissentient only, agreed to cable to the London Importers' Joint Committee, suggesting that in order to meet the desires of the buyers for outside markets auction sales should be held on Tuesday in the ordinary way, sales being made subject to the guarantee, which we understand the buyers have already entered into, not to feel the London market.

A CIRCULAR.

Later in the afternoon the Indian Tea Association issued the following Press Circular :—

With reference to the question of the abolition of the one pound draft allowance on teas sold by public auction in London, we are informed that the following telegram was received yesterday morning by the General Committee of the Indian Tea Association from the Indian Tea Association, London: "Importers' Joint Committee urge stop Calcutta auction sales fortnight, allowing private sales outside markets only. Colombo similarly advised."

A meeting of the General Committee was held immediately on receipt of this telegram at which the following resolution was unanimously carried :—"That this Committee strongly favours the telegraphed suggestion made by the London Importers' Joint Committee to stop Calcutta auction sales for two weeks, and to sell only for markets other than London privately, and the members agree that the firms they represent will withdraw all teas catalogued for to-day's auctions."

The Resolution was promptly made known to sellers who all supported it, and all tea put up for to-day's auctions was withdrawn. —*Englishman.*

COLOMBO STANDS OUT.

The following telegram has been received by the Ceylon Chamber of Commerce from the India and Ceylon Importers' Joint Committee in London :—"Importers' Joint Committee urge stop Colombo Auction Sales fortnight allowing private sales other countries Calcutta similarly advised." The reply of the Ceylon Chamber was as follows :—"Nothing to complain of local terms net cash seven days full invoice weight Chamber regrets cannot comply."

The request from London (says the *Times of Ceylon*) was an extraordinary one, and does not disclose reasons. The only one which can be conjectured is that Colombo was asked to do what it appeared to be necessary to call upon Calcutta to do. There purchases for the Home market are larger, and increase orders are possibly being cabled out even now. But Home dealers could not operate in the Colombo market on the present occasion, because prices here are higher than in London, and practically no such business is at present being done in that way; tea purchased next week would not get Home for six weeks; and, above all, the terms ruling here are

what are now being fought for in London, *i.e.*, any purchases for the United Kingdom would be *without the draft allowance*. Settlement in seven days is another local custom; but we believe the terms in Calcutta are three months' sight, though whether they have the draft allowance we cannot say. The request from London was for a discontinuance of our sales for a fortnight; and we should have been glad if the Committee of the Chamber could have strained a good many points to comply. If the lead from London could not be followed blindly, a telegraphic request for further information might have been sent; but it will be seen that the grave step of refusal has been decided upon. It certainly would appear that local conditions are not understood in London, because producers up-country would at once become suspicious if their teas were sold by private contract for foreign countries—which means nine-tenths of the total sent down for sale locally. It would not work; and absolute cessation—with the dislocation of the Australian trade, for example—appears absurd. We are also told that Agents in Colombo could not withdraw the teas of London Companies and Home proprietors without their instructions. Calcutta can do so, however, and we admire the promptness with which they have responded. Further information from London may be expected here; for if the adhesion of Colombo appears essential, the telegram sent on behalf of the Chamber will bring a cable in reply. Pending the receipt of this, we have to consider whether anything at all can be done. We would appeal to every tea owner sending his produce to the Colombo market to request that it may not knowingly be sold for shipment to London. We trust that firms who may receive orders from London will suffer some personal sacrifice and refuse to execute them pending the settlement of the difficulty; and that the Chamber will consider the propriety of calling upon those who do not thus remain loyal to resign their membership. We shall know in a few days the reason for the appeal from London; and the further hope we have is that with Calcutta's compliance our Home representatives may be able to dispense with any more than the "moral support" accorded in the recent Resolution passed by our own Chamber.

Advices dated 11th instant, state :—

The Chamber of Commerce and the Tea Traders' Association have jointly and unanimously decided that it is inexpedient and impractical to stop local public tea sales.

The General Committee of the Planters' Association meets next Friday, when the buyers' guarantee not to purchase for the United Kingdom may be demanded.

THE COLOMBO VIEW.

Interviewed upon the subject of the 1-lb. draft allowance on tea and the position of the Chamber of Commerce in the matter, a leading member of the Chamber—who did not wish his name to be mentioned on the ground that the opinions he now holds might be changed by future developments of the question or additional information from London—made the following statement to one of the *Times of Ceylon's* representatives:—

"It is felt that nine-tenths of the tea sold in Colombo is for markets other than London, and that the prices ruling locally and offered by buyers for these markets are higher than those ruling in London and higher than London buyers would be willing to pay. Consequently, there will be no end gained by stopping the local sales. The London Associations suggest that private sales might be allowed for markets other than London, but what is to hinder a buyer for other markets from extensively sending teas to London? The conditions prevailing in the local market are quite different from those ruling in London. Here we sell for cash in seven days, the whole invoice weight being paid for without deduction of the 1-lb. draft allowance, so that there is no justification for stopping sales here. Besides all this, local firms have not the power to hold the teas of their constituents off the market without their permission. In Calcutta the conditions are different. There much more tea is sold for London, and the action of the Calcutta sellers in stopping sales will much more largely contribute to the end in view than any such stoppage in Colombo would do."

THE CEYLON ASSOCIATION (LONDON) AND DRAFT ALLOWANCE ON TEA.

Mr. H. K. Rutherford presided on 12th ultimo at the annual meeting of the Ceylon Association in London, held in the Council Room of the London Chamber of Commerce, Eastcheap, E.C., and, in moving the adoption of the reports of Committees, said that the most important proposal that had been discussed by the Tea and Produce Committee during the past year was the one relating to the draft allowance on tea. This was a serious question for imp[orters] and producers, and he understood it was the desire of t[he] Indian and Ceylon Associations that before any action was taken th[ey] should have a meeting with the Committee of the wholesale deal[ers] to hear what they had to say to the proposal. Then the whole su[b]ject would come before a general meeting of importers for fi[nal] decision. He thought this procedure would be approved, as th[ey] were all agreed that it would be unwise to act with precipitancy [in] such an important departure from the present trade customs [in] dealing with tea. (Hear, hear.) Mr. Thornton Williams (represen[t]ing Mr. A. Thomson, of Messrs. Whittall & Co.) said he wa[s] in sympathy with the proposal, but he could not help feeling th[at] the way it had been put forward was most unfortunate. Wh[en] they wanted to sell a thing they must consult their buyers. I [he] believed an immense amount of harm had been done amongst th[e] buyers by the manner in which this proposal had been put forwar[d]. He attended the dealers' meeting held last week, and the impressi[on] he got was that the tea-dealers meant to fight very hard against th[e] proposed change. The draft allowance was one of the condition[s] of sale, and if one condition was to be tampered with there wa[s] ground for saying the conditions as a whole should be reconsidere[d] with a view to other alterations. He admitted that the 1-lb. allow[-] ance was very onerous on small packages, though perhaps [it] was not a serious matter where large packages were concerne[d]. If the Association had approached the trade and said, "The[re] are certain conditions of sale that we should like to consu[lt] you about," it would have been different. He had been ver[y] much struck by the concluding remark of the Lord Mayor [at] the tea-dealers' meeting. "If you are united," he said, "you can g[o] beyond this question of the pound draft." There was great signi[-] ficance in that remark. He thought it was a pity the Associ[a-] ation had asked a number of importers to sign an undertakin[g] with a view of putting it forward as a manifesto to the trade. H[e] had been corresponding with Mr. Leake, Secretary to the Ceylo[n] Association, and that gentleman said it would not be satisfactor[y] to approach the trade; it had been done before and without succe[ss]. But at the dealers' meeting one speaker remarked that Mr. Leak[e] had said nothing would be done without the trade being consulte[d]. Mr. Leake: But there is no need to consult the trade till w[e] have decided to do something. We have not yet decided to d[o] anything at all. (Hear, hear.) The Chairman: As I said just no[w] there will be a meeting of importers and the trade before anythi[ng] is settled. Mr. Williams: My point is that we were asked to sig[n] this before we knew that the trade were to be consulted. If th[is] had been stated in the first instance it would have been differe[nt]. The Chairman: We have not communicated with the trade [at] all yet. The time will come when we will do so, but we have n[ot] got to close quarters with them yet. The reports were adopte[d] unanimously.

Writing from Delft, Mr. J. Van der Chijs sends th[e] following interesting letter to the *Grocer* :—

SIR,—I hope not to be considred meddlesome in taking an intere[st] in your Mincing-lane home politics *re* the above topic, and puttin[g] the following suggestions before your readers from an outsider[']s point of view.

The tea trade is greatly dependent upon the growers. Should th[e] latter decide not to send any tea forward the London tea trad[e] could do nothing else but put up the shutters. There is a preceden[t] in the history of this country when the people in the East India[n] colonies decided to destroy the entire crop of, I believe, cloves. What was the result? That no cloves coming forward, none coul[d] be sold either, and prices jumped up by leaps and bounds.

A paying business resulted in after years, as all old stocks g[ot] used up. My firm opinion, therefore, is that the tea growers an[d] East India merchants are the wire-pullers. Yet they cannot hav[e] it all their own way, for they cannot afford to cæsarise the marke[t] as their own purse has a say in the matter too.

If the dealers—those visiting the auction-rooms—stand unite[d] my belief is that the former are pretty well at their mercy. It i[s] all very well to have sale catalogues printed henceforth with th[e] new conditions, but how are sellers to help themselves if buye[rs] refuse to be dictated to?

One pound draft on each average nett chest weight, to be estab[-] lished at, say, 80 lbs., makes an allowance to the extent of 1¼ pe[r] cent., or equal to—⅛d. on teas selling at 10d. per lb.; ¼d. on tea[s] selling at 1s. 8d. per lb.

It is well to be on the safe side, and that a fair margin be left for all emergencies. Not heeding the newly-dictated terms, methinks it would be well before the commencement of each sale for buyers to unanimously proclaim to sellers their conditions, without which no contract is passed, *viz.*: All given bids to be understood to include the usual draft allowance, or the alternative; the merchants to consider all given bids to be reduced by—⅛d. on all teas up to 10d. per lb.; ¼d. on all teas up to 1s. 8d. per lb.; say ½d. on all teas above 1s. 8d. per lb., and no draft allowance, same being this way provided for by the buyers themselves, who do not want same abolished.

PRODUCE AND PLANTING.

Weighing Paper with Tea —The Lipton case, the first stage of which was decided last week, is *sub judice*, as it will shortly come before a higher Court. It is pointed out, on behalf of Messrs. Lipton, that a mistake had crept into some of the reports of the proceedings, in which it is represented that the deficiency in a 1-lb. packet amounts to as much as 2 oz. While the Company make no secret of the fact that their 1-lb. packets include the weight of the paper, it is of course quite wrong to imagine that the paper weighs anything like 2 oz. The explanation is that drachms have been mistaken for ounces in the reports in question. It was stated, during the hearing of the case before the magistrate, that including the weight of the wrapper in the weight of the tea was a custom of the tea trade "from time immemorial." This has hurt the feelings of a number of firms who do not follow this custom. So many packet tea trading firms have denied this soft impeachment that it is necessary to remove the impression that it is a general custom to include the weight of the paper with the tea. It is stated, on behalf of Messrs. Lipton, that the £17,000 mentioned as profit on this method of selling tea during a year's operation is greatly exaggerated, and that the sum of £2,000 would be nearer the mark. It is also argued in defence of those who sell the paper with the tea that if a buyer goes into a grocer's shop and buys a pound of sugar, in the ordinary way, the grocer places a piece of paper on the scale, puts the sugar on it, and when the scale is turned, does the packet up and sells it. No doubt if the buyer wanted it he would give the sugar without the paper, and the buyer would get a little more. It is the same in regard to packet teas and all other articles sold in packets. This is ingenious, but not conclusive.

Interesting Figures.—*Apropos* of the Lipton case, a correspondent writes that the turnover of Lipton's business is estimated to 3,000 chests per week. It follows that if, as was proved when the Company was convicted for selling at short weights, the gain is 3 per cent., there would be three pounds of tea in every chest which would virtually cost nothing. This, on the turnover of 3,000 chests, would equal ninety chests gained per week. Taking the value of the quantity gained at 1s. per pound duty paid, the money value would be £450 per week, or £23,400 per annum

Brazil Coffee.—The British Consul at Rio de Janeiro, in his report received on Brazilian affairs, speaks in hopeful terms of the coffee-planting industry, and expresses surprise that, although some hundred millions sterling of British capital are employed in public funds and enterprises in Brazil, so little has been invested in the profitable pursuit of coffee-planting. It may be due, he thinks, to a feeling of insecurity as to the protection afforded to the property of foreigners in the interior of the country; but he notes with satisfaction that the President of the Republic has made a powerful appeal to the State Government to extend full protection to all immigrants and foreigners.

Cocoa.—The consumption of cocoa is increasing rapidly. In some countries this is very noticeable. Germany has doubled her consumption of cocoa since 1882, and England has considerably more than doubled hers. In France the consumption was in 1868 about 15,000,000 lbs, which figure has now been more than doubled. The annual consumption in the various countries was, according to some recent statistics: France, 30,500,000 lbs; United States, 26,400,000; England, 22,100,000; Germany, 19,900,000; Holland, 17,000,000; Spain, 12,800,000; Switzerland, 4,800,000; Belgium, 3,600,000; Austria-Hungary, 2,200,000; Russia, 1,900,000; Denmark, 1,400,000; Italy, 1,100,000; Sweden, 800,000; Norway, 500,000; Portugal, 200,000. Reduced to annual consumption per individual, Holland heads the list with three and a half pounds per head, Switzerland comes next with one and three-fifth pounds, and France third with four-fifths of a pound.—*H. & C. Mail.*

A MISSIONARY HYMN.

[A tea company advertise that if you buy their one-and-four or one-and-six tea they will send one penny to any British Mission you please.—*Westminster Gazette.*]

From Bethnal-Greenland's attics
To Charing Cross or Strand,
Where hunger-swayed fanatics
With scone and roll expand;
As many as are taking
Their humble evening meal,
May thereby be awaking
Fresh missionary zeal.

What though such pious wheezes
Make thoughtless sinner smile,
So pious folk it pleases—
Our charitable style;
Still on each zealot hurries
To boom his several sect,
And mission "muffin-worries"
A double toll collect.

Then let your hymns re-echo,
Consume the scone and roll,
While every cup of Pekoe
Can save a heathen soul;
For as each thriving tea-shop
To your commands attends,
It sends another bishop
To earth's remotest ends.

—*The World*, June 7.

CEYLON TEA IN AMERICA, &c.

The Secretary of the Planters' Association of Ceylon sends to the local press the following:—

TEA AS A BAR-ROOM BEVERAGE.

CHURCH ARMY TO BEGIN A NOVEL CRUSADE AGAINST DRUNKENNESS.

After several years of experiment the United States Church Army is to begin on June 10 next a novel and energetic crusade against drunkenness in this city. The drink war is to be waged through a medium of drink in the form of tea, which Col. H. H. Hadley, the lay director of the army, declares to be possessed of all the useful attributes of a "gold cure." A tea bar, where the drink can be obtained in any form, will soon be opened at 76 Allen street.

The crusaders affirm that before a man or a woman can be induced to give up alcoholic stimulant, he or she must be provided with an adequate substitute; something that will quietly and insidiously work its way into the victim's system and gradually counteract the desire for alcohol. With the object of providing this insidious substitute, Col. Hadley and his fellow-workers have experimented, they say, with every known non-alcoholic beverage. Hop beer kept in solution with carbolic acid instead of alcohol has been tried and found wanting. Other concoctions have given no better results Coffee, when tried, produced to some extent the desired effect, but its narcotic properties were found to be too great to render it a safe substitute for beer. Tea was finally selected.

"Tea," said Col. Hudley this morning, "is not narcotic, but is stimulating. It is also, with regard to the digestive organs, the safest beverage that can be drunk. Tea signifies (?) thirst; beer creates thirst. There is the difference.

"Many persons on the East side like beer because it is always drawn cold. We will have our tea equally cold, and, moreover, there will be ice in it. You cannot put ice in beer, you know, for it would spoil the drink.

"We shall conduct our bar at 76 Allen street on liberal principles. Ice cold tea and tea steaming hot will be on draught at 1 cent a cup, and we shall be prepared to fill "growler" cans at a nominal sum."

THE SCIENCE OF TEA-BLENDING—PRACTICAL HINTS.

The *Grocer* publishes the following as written by an Expert:—It has now become so entirely a matter of course with the trade to blend several kinds of tea together before offering them to consumers that it is somewhat astonishing to reflect how recent is the growth of this practice. When tea was first introduced the kinds were few, and it found its way to the public in leaf or in infusion through the coffee-houses, duty being levied on the infusions at the rate of 8d. per gallon; and from the time Garway issued his oft-quoted advertisement, in 1659, until within the last fifty years the bulk of the imports found its way into the housewife's tea-pot unmixed, or if mixing were done it was done by the good lady herself, who would have by her some fine orange pekoe or choice gunpowder to add to her bohea or souchong on great occasions.

It was not indeed until Indian teas came fully on to the market that the practice of blending became universal. Their great strength was a valuable quality which would not allow them to be ignored; while, on the other hand, their harshness made them unacceptable to the public by themselves. Hence they were mixed with China tea, at first in small proportions; but, as the production increased, and improved cultivation and manufacture removed many of the objectional qualities possessed by some of the earlier imports, the proportion of Indian tea became larger and larger until, rapidly following on the production of large supplies from Ceylon, China tea gradually dropped out of use, until it now forms only a fraction of our supplies for home consumption.

A COMPARATIVELY FEW YEARS AGO

each grocer blended his own tea, and their thought and skill went to make up the various canisters of the leading men. In other cases, however, carefully treasured formulas were slavishly adhered to, and blends made up from them by rule of thumb, regardless of the different requirements of various districts or of the changing taste of the public.

The cause of the failure of many retailers to work up a successful and profitable tea trade lay, beyond doubt, in the fact that their blends were unskilfully compounded, many of them undertaking the prepartion of blends while lacking the requisite knowledge of the properties of the various classes of tea, or the lines on which they should be combined; and through the neglect of many, even of the largest buyers, to go into the matter scientifically, immense quantities of good tea were annually spoilt, and many grocers were glad to hail a deliverer from their difficulties when the wholesale blender made his appearance in the trade.

The rise of the wholesale blending houses seems a recent event, even to those of us who consider ourselves still young in the trade, and the system has certain obvious advantages to recommend it. Moreover, it has strongly in its favour the fact that it is in harmony with a tendency of the time, much deplored by the old school, by which the grocer is daily becoming more of a distributor of proprietary articles. Now-a-days, however, tradesmen cannot afford to look on trade questions from a sentimental standpoint, and if by lavish advertising a demand is created for certain brands of tea or soap or what-not, the grocer must be prepared to supply that demand.

With regard to loose tea, however, the position is different. The purchaser of a pound of 1s. 8d. tea does not ask whether it is the grocer's blend or Messrs. So-and-so's blend, and it is for the grocer to consider which of them it is to his advantage in the long run to supply. Briefly summed up,

THE ADVANTAGES THE GROCER FINDS

in buying ready blended tea are saving of time and trouble and reduction of stock; the disadvantages are loss of individuality in his teas, and the fact that any Tom, Dick, or Harry, without knowledge of the trade or experience, can supply exactly the same article at the same price as the trained grocer. In view of the great and and increasing complexity of the modern grocery trade it would perhaps be a counsel of perfection to urge the desirability of every grocer becoming a tea expert and blending the whole range of tea he stocks; but it is surely within the range of possibility for a grocer to have at least one leading line in tea to which he should give special prominence, and which should be his own blending, individualised, and different to that which his customers could obtain elsewhere.

Such a blend he could confidently introduce to his customers as his own speciality with the object of arousing their interest and securing their recommendation; skilfully worked this should g him a hold on the tea trade of his district that will be extrem difficult for rivals to upset. The

CHIEF OBJECTS TO KEEP IN VIEW

in making up the blend are that it shall come out well in the wa in which it is to be infused, and that it shall possess a flavour wh shall please the taste of your customers, and at the same time sufficiently distinctive to make the blend your own speciality; a he who secures these objects in the simplest way and at least c will be the most successful blender.

The first consideration then is the water of your district. I contains lime and other minerals in solution it is termed "har and such water fails to draw out the characteristics of smooth ri teas, and strong rough kinds have to be employed. In "soft" wa however, all that is in the tea comes out, and the strong rou kinds suitable for hard water taste coarse and rank, and the f flavoury kinds are more suitable. The next point to consider is

THE TASTE OF THE CUSTOMERS

for whom you intend to cater. The taste of the consumer var very considerably according to the district, and to a certain exte this taste must be followed by the man who intends to work up big trade. Certain bold spirits, however, finding the taste in th district to be, in their opinion, vitiated by an excessive use scented caper or other breach of the laws of good blending, ha made it their study to educate and elevate the taste of their cus mers, and have achieved success. This, however, is an arduo and slow process, and most retailers of tea will probably prefer t simpler method of falling in with the prevailing taste of th customers at first, and introducing improvements from time time as they see their opportunity. The danger of this course that the blender may allow his teas to sink into a dead level w those of his neighbours, without distinctive character or qualit and this brings us to the third and, perhaps, the most importa essential of good blending, namely, the necessity of

YOUR BLEND BEING SUFFICIENTLY DISTINCTIVE

to make it your own speciality. This can always be done, whe necessary, within the lines of the taste prevailing in your distri But where there is a freer scope by reason of a more varied tas as in London or other large centres, the blender has a much wid range from which to select his special flavour and style; and th we find, on examining the teas of the leading London retail tea-m hardly any two of them are composed upon the same lines, the a of each being to make a blend differing from that which his cus mers would obtain from other sources, knowing that when on they had become used to his tea, provided it was really good, an pleased with its distinctive flavour, their custom would be assu to him. This is the secret of the success of most of the best-kno blends and blenders. It is a point too often utterly ignored grocers, but which must be most carefully attended to if they me to retain and increase their tea trade.

To put the matter practically I would say, first ascertain the n ture of your water supply; next the approximate composition the blends which are going into consumption most extensively your district; then experiment to improve on the said blend wi the teas indicated as being most suitable for the water; and fina introduce some striking ingredient into your blend that sh differentiate it from those of your neighbour. There are ma ways of doing this - by giving prominence to some Indian gard of marked character, or by introducing autumnal tea, or using small quantities (about an ounce to a pound) Namuma tea, Ceyl oolong, Canton or Foochow scented tea, or Formosa oolong. Ea of these teas has its own distinctive qualities, and combinations them give scope for a practically endless series of distinguishi characteristics which may be imparted to your teas.

The ingredients of your blend being selected, your next ca must be to

GET THEM THOROUGHLY ASSIMILATED.

This is best effected, in the first place, by the use of a good tea-mix which will distribute the leaves of the various teas in a fairly ev proportion throughout the bulk; but so far the assimilation w be merely mechanical and necessarily to a great extent imperfe To render the assimilation thorough and complete the blend mu now be put in air-tight canisters and allowed to remain in a roo with as even temperature as is possible, for at least a week. this time the interchange and combination of the flavours of t various ingredients will usually be accomplished, but in some stances it will be found to be advantageous to allow the blend mature for a longer period.

The question of the appearance of your tea is one that should not e neglected, as although the remark that "tea is not sold to look t" is true enough, yet it is remarkable to what extent people are rejudiced for or against a tea by its appearance It will therefore e found desirable in most cases, and especially where teas of irre-ular appearance are used, to sift them before putting into the nixer, to remove the large leaves, which should be cut to gauge in tea-mill or broken through a sieve and then placed in the mixer vith the rest of the blend; in some cases it may also be necessary o sift out the dust, but this is not recommended, as it is the best iquoring part of the tea.

Your blends are now ready for sale, and, of course, after they eave your hands you, to a great extent, have no control over their ate. and the result of all your care and skill may after all be well nigh spoilt by careless or improper brewing; therefore it is well o print clearly on every tea wrapper brief

HINTS AS TO HOW TEA OUGHT TO BE MADE,

n which the following points should be insisted on. First, the vater must not be put on until it boils, and it should be put on the very minute it does boil—water not quite boiling or water that has been boiling some time will spoil any tea; next, the teapot must not be allowed to stand under a cosy for an indefinite period—indeed, perhaps the most common mistake in making tea is allowing it to stand too long. The first three minutes bring out the quality, the next three or four add to the body, but beyond seven minutes the onger it stands the worse it gets. These are the two most import-nt points.

It should be known, however, that there is nothing so good as he old-fashioned brown earthenware teapot for making tea; next o that comes the real silver teapot.

A FEW CAUTIONS

n conclusion. Avoid unsound teas most rigorously; a tea with the least trace of mustiness or "mousey" flavour will spoil any blend.

Scented teas are often used most unwisely. For ordinary purposes one part in twelve, or even one in sixteen, is quite sufficient to give the blend a distinctive flavour. Fine Ceylon or Formosa oolong or Foochow pekoe are the most desirable kinds for the purpose.

Of course the above applies to ordinary trade. There are districts where people drink a mixture of one part caper and two parts pungent broken Assam, and appear to like it.

Remember, if your tea is allowed to stand near any strong-smelling articles it will absorb their flavour. Fine teas are often ruined by contact with soap, cheese, or other items of a grocer's stock.

In conclusion, be sure your blends have a distinctive character. Let them always be the same style and always kept up to standard quality, so that your customers will learn to rely on them, and come for them again and again. It is thus that big businesses are built up.

THE CEYLON TEA SITUATION.

A CHAT WITH AN AUTHORITY.

"Omar" writes in the *Canadian Grocer*:—Mr. C. Arthur Lampard, of Harrisons & Crasfield, London; Crasfield, Lampard Co., Colombo, and Lampard, Clarke Co., Calcutta, is spending a few days in Toronto this week. Mr. Lampard has been in England about eighteen months, and is now returning to the Orient by way of Vancouver. He intends to spend the next four years in India and Ceylon. The particular object of his visit to this continent is to gather, from a personal observation, what methods are being employed to push Ceylon tea here. In pursuance of this object he has already visited some of the commercial centres in the United States and in Canada.

"In my opinion," he said, in answer to a question, "the best thing for us to do is to advertise liberally and leave to private enterprise the pushing of the tea. We have already got the cities pretty well. What we want now is to get the people in the country to drink Ceylon tea. At present, however, the people in the country largely use Japan and green tea, and it is always more difficult to turn these to Ceylon and Indian tea than it is those who use black tea. This is quite natural, as the change from China black to Ceylon tea is not as marked as the change from green to Ceylon and Indian tea. When I went to Russia, some ten years ago, to introduce Ceylon tea I was told that the Russians would never take to our tea. As they were black tea drinkers, I thought different. Well, I sold them 200 packages, or about 20,000 lbs.; to-day they take 8,000,000 lbs."

"Are you going to see much expansion in the acreage of Ceylon tea?"

"As far as the finest teas are concerned I think not. You know the finer and the better flavored teas are grown on the higher elevations. The higher you get up the mountain sides the better do you find the tea. Well, practically all the land on the high elevations has been taken up. On the low lands, however, there is room to expand the plantations, but, on the low lands, only low-grade teas can be produced. By utilizing the low lands, the total yield of tea in Ceylon could be increased, I should think, to 150,000,000 or 160,000,000 lbs."

"The yield for the present year is estimated at 125,000,000 lbs.," I interjected, "and some estimate that the maximum yield in any year will not exceed 130,000,000."

"Yes, I know," replied Mr. Lampard, "but I think those who estimate that 130,000,000 lbs. will be the maximum are not taking into consideration the possible increase in the acreage in the low-lying districts. As far as this year's yield is concerned, I think it will be nearer 128,000,000 than 125,000,000 lbs."

"What is your opinion in regard to the future of prices?" I asked.

"Well, my opinion does not accord with that of a good many others. But I am confident I am right. I think that we shall see a lower range of values than at present exists, from the very fact that the conditions now obtaining will lead to an increased yield. For instance, we now pick a bud and two leaves. Well, it is a simple matter to pick another leaf. Then there is the fact not to be overlooked that a high price on Ceylon tea will mean an increase in the attention to China tea."

JAVA QUININE.

Mr. C. W. van Heeckeren, director of the Bandoeng factory, has written a very long letter to a Java paper to protest against certain serious insinuations made in that journal, in which it was alleged that the Bandoeng works had carried on a private speculation in quinine made by them for Java planters. It was said that the factory had led the planters to believe that this quinine was held in stock for the planters' account, whereas in reality it had been privately sold by the factory. Prices subsequently rose, and when the planters gave orders for their quinine to be sold, it transpired that it had already been disposed of months ago, whereupon the planters decided to break off relations with the Bandoeng works, and to consign their barks to Amsterdam as before. The statement was made that the German quinine-makers, out of enmity to the Bandoeng works, had purposely engineered a rise in the market as soon as they got wind of the aforesaid speculation, so as to bring about a breach between the planters and the Bandoeng works. Mr. Van Heeckeren denies all these allegations. He says that the factory is debarred by its articles of association from trading in quinine, all that the works make being sold through Messrs. McNeill & Co., of Samarang. The accounts between the works and the planters are settled in March of each year, when Messrs. McNeill are in possession of the account sales for the whole of the preceding year. No one could have foreseen the sudden rise of quinine to 1s 9½d last March, and Messrs. McNeill before that rise had sold at from 12½d. to 14d. per oz. on delivery. On January 1 about 5,000 kilos. of quinine had been made by the factory, for which the owners had not yet received an account-sale. Of this only 120 kilos. were at the works, 1,000 kilos. were at Batavia, and 3,600 were on the way to various ports. During January and March about 3,200 kilos. made at Bandoeng were sold. Mr. Van Heeckeren complains that the Bandoeng factory is badly supported by the Java planters. Some of them habitually belittle it, and carp at its working. The total production of the Bandoeng factory between January 1 and March 13 was 320,000 oz., of which Messrs. McNeill had sold in the same time 253,580 oz., at an average equivalent of 7c. per unit gross. In commenting upon Mr. Van Heeckeren's letter the Java paper maintains its allegations, although it acknowledges that the speculation was not undertaken for motives of illegal personal gain, but was merely an ill-considered speculation in the interest of the planters, who, unfortunately, have turned out losers over the affair.—*Chemist & Druggist.*

A CEYLONESE TEA-MAKER IN CHINA.

WORK IN RUSSIAN TEA FACTORIES. TEA-MAKING BY MACHINERY.

In a recent issue we (says an evening paper) referred to the return of Mr. Francis Allehakoon, a Ceylonese tea-maker, who came back to the island after spending sometime in China, whither he proceeded under an agreement with Messrs. Molchanoff, Pechatnoff & Co. to make tea in one of their factories in the interior. Mr. Allehakoon has given one of our representatives an account of his experiences in that country, and his description of the tea gardens, and process of tea manufacture there will be found interesting reading

Mr. Allehakoon, who was formerly tea-maker on Atgalla, Gampola, under Mr. G. C. Bliss, left Ceylon on the 16th January last in the steamer *Sydney* for Shanghai, from where he went on to Hankow, 600 miles distant, by a small coasting steamer, the trip occupying five days; while from Hankow he had to go some 114 miles into the interior, his destination being a place known as Yung-lo-den, the journey from Hankow being made my river boat and palanquin. It is described as a fine tea district, lots of tea all round, but in small patches, ranging from about 30 to 60 acres, all belonging to the Chinese. Messrs. Molchanoff, Pechatnoff & Co. have started a factory there, and buy large quantities of green leaf from the native growers. Work is carried on for about six months and when the season is over there is practically nothing to do. The factory, however, is equipped with only a small oil engine and a 32-inch tea-roller, while the

FIRING IS DONE BY THE CHULA PROCESS

—as still obtains in some of the small native gardens in Ceylon—the Chinese using wood charcoal for the purpose, and the firing being done fairly well. Of green leaf, some 4,000 lbs. to 5,000 lbs. were brought in daily to the factory during the season, which, as above stated, only lasted six months,—from the end of March to the end of September,—while the other six months there was no green leaf to be found, the cold being very severe and the ground covered with snow for long periods. As a contrast to this, the summer months were hot, at times the heat being very trying. When Mr. Allehakoon reached Yung-lo-den he says the winter was not over and he suffered from the cold considerably. For two months there was no work done, but after that large quantities of made tea were turned out of the factory. A much larger amount could be purchased if it were not for the native buyers, of whom there were large numbers. They, however, carried on their work in a very primitive fashion, so that there was nothing much to fear from them as regarded competition. A large quantity of this native-made tea was also bought at the Russian firm's factory, but required to be re-fired. About 200 to 300 male coolies were employed in the factory for sorting and packing, while about 300 to 400 women were engaged only in picking out of the tea the stalks and other rubbish, of which there was plenty; and finally the different grades, from broken orange pekoe to dust, were packed in lead-lined half-chests, containing about 50 lbs. each. The lead used was very much thicker than that used in Ceylon, and the outside of the chests was ornamented with paper, covered with Chinese characters and floral designs. The tea, however, it may be mentioned, was

PRESSED INTO THE CHESTS BY THE BARE FEET

of coolies. The native wood used for the chests was good and durable, and with the lining, &c., must have weighed an additional 15lbs. All the tea was despatched to Hankow and then shipped to Russia. Yung-lo-den itself is a thickly-populated district, and the green leaf is brought from 2 to 13 miles by the natives, and delivered at the factory door at a cost of 5 Mexican-dollar cents a lb. The tea is a fine, small leaf, with a soft flavour, but on the whole is not so good as the Ceylon product, and infusion being very light with about half the strength of Ceylon tea. In plucking there is no distinction observed, and coarse and fine leaf are mixed together, which necessitates much sorting and picking of the made tea. Pruning is an unknown practice there, and the bushes are left to grow at will; nor are the gardens weeded, with the consequences that there is a lot of scrub among the tea. The bushes are strong and healthy ones, about 3 feet in height, but a great many useless branches are allowed to remain. Mr. Allehakoon was in the factory about two months, from March to May, as a month after his arrival there another tea-maker from Ceylon turned up, and his time being over, he having gone only on a six months' agreement, Mr. Allehakoon returned to Ceylon.

BRICK TEA FACTORIES.

Whilst at Hankow he took the opportunity of visiting the Russian tea factories there. Messrs. Molchanoff, Pechatnoff & Co., and Messrs. Tokmakoff, Molokoff & Co., and another Russian firm having huge buildings there. Messrs. Molchanoff, Pechatnoff & Co. had the two largest factories, which are very much bigger than any in Ceylon. The number of hands employed in these was also enormous, there being over 8,000 coolies and carpenters employed in each factory during the tea season; and in these factories only brick tea for the Russian market was manufactured. Souching and other low grades were chiefly used and the process of manufacture consisted in steaming the leaves and subjecting them, while damp and pliable, to great pressure in wooden moulds, about 4 lbs. of tea being used for each brick, which was afterwards hardened into the consistency of stone, when it was ready for export.

CALCUTTA TEA SALES.

"J." writes in *Capital*:—

The prices of teas sold on garden account in Calcutta cannot but be depressing to those interested in the industry. The question which naturally suggests itself to those who are affected by the present slump is, why the present depression? Is it justified, or otherwise? Some little time ago we reviewed the position, and we then pointed out that the inflation in Calcutta was not justified by the statistical position, and that there could but be grief if it was carried on; and our forecast has, unfortunately, been more than justified by the sales held to date, and we venture to say that there is just as little reason for the present slump as there was for the former boom. 'Tis true that London regulates the values of most articles of produce, but with regard to tea this is, according to our brokers and experts, to a certain extent in Calcutta, held in check by the Persian Gulf and other outside markets. To a certain extent this may no doubt be true, but as these markets take only what we might term whole leaf teas, the heavy burden of all the brokens is thrown upon London, with the result that we see it reflected in the values realised for these classes in the sales held up to date. In former years a planter looked to his brokens running up his average, but the result now is that, if he makes much brokens, he lowers his averages. All the same, we cannot but think that the price now paid for brokens in Calcutta is very much below the values obtaining in London, and those who lost so heavily in the first auction in buying are now recouping themselves in what they are bidding for these classes. The commonest tyro knows that a Broken Pekoe liquor is far stronger than a Souchong or Pekoe Souchong one, *i.e.*, it makes more cups of tea, and after all this is what should regulate the values, yet we see Souchongs alongside of Broken Pekoes, at 5 annas per lb. or thereby.

The prices in London realised for garden invoices in 1898 worked out on an average the same as the year before, but according to the Administration Report of the industry by the Assam Government the Calcutta sold teas only realised an average of $\frac{\text{Assam}}{\text{Cachar and Sylhet}}$ $\frac{6A\ 9P}{5A\ 0P}$ against $\frac{7A\ 8P}{5A\ 11P}$ in 1897. This would point to a good season for buyers. What are the reasons then of the present slump? The statistical position is good, notwithstanding the increased export of, say, five million lbs. This year when the season commenced the stock was considerably more than this under the year before, and some three millions of this increased export is due to increased facilities of transit, and also to Sylhet and Cachar sending in their usual quantity. The large companies are to a great extent to blame for this sort of panic, for most of them instructed their managers to rush their teas down to Calcutta at no matter what cost. Such general instructions cannot be kept secret, and in addition they left the impression behind that those most interested had no faith in their own property. We imagine if it were possible to get at correct figures that of the five millions extra shown as exported, there is really only about a million lbs. extra as compared with a normal year, the four million representing Cachar and Sylhet, increase over an abnormal year, and the rest by all districts combined hurrying forward their crops. These figures are calculated on the year ending 31st May, as per reviews of the season 1898-99 received by mail before last. Were we to take the figures which will be out ere this can appear in print, *i.e.*, to end of June, the position would be more accentuated. As June has been a most unfavorable month in all districts, in fact, has not been normal in many, so that the

uge leaps and bounds will not be increased by any but new gar-dens' produce. It will be noted that the earlier highly speculative prices paid by buyers had the effect of driving out those of the Persian Gulf, who have now that things have sobered down come to the front again and we hope may continue to do so, although we doubt if the prices they pay are more than equivalent to London ones, but they have this good effect, that they lighten London of so much weight, that it is bound to do good, even at equal prices. It's a thousand pities that outside markets for the lower class of Broken and higher class of dust such as Pekoe kinds cannot be opened up, as we believe it would ease the market more than the taking of any of the whole leaf grades Such a market, we think, might, with proper pushing, be found amongst the lower castes in Northern India. The fact that tea shops are in existence where the Indian Hodge can drink his cup just outside the gates of some of our jute mills, is proof positive that he has only got to have the article put before him properly to appreciate it, and look what seeming millions there are to consume it, could it be but properly pushed.

TEA, &c., COMPANIES.

International Tea.—The balance brought down on the profit and loss account is £90,933, against £76,113 for the previous year. It is proposed to pay a final dividend on the ordinary shares, making 3 per cent. for the year, and to carry forward to the next account £4,219.

Mojuli Tea.—For the year ended December 31st last the crop produced amounted to 1,123,632 lbs., being 89,632 lbs. in excess of the estimate and 223,942 lbs. over the outturn of 1897. Quality showed a slight falling off, which, combined with the low range of prices ruling during the greater part of the sale season, resulted in the rather unsatisfactory average of 8¾d. per lb., against 9¾d. in the previous year. The revenue for the year amounted to £41,385, and the expenditure to £36,757, leaving a surplus, after payment of commission to directors and European staff, of £4,140. The directors recommend the declaration of 2½ per cent. final dividend on preference shares and 5 per cent. on the ordinary shares. The balance of revenue will then amount to £5,090. From this sum the directors recommend that £5,000 should be carried to a reserve fund. The crop for the current season is estimated at 1,128,000 lbs.

Moabund Tea.—The crop of tea produced during the past season amounted to 1,017,291 lbs., which, as compared with the yield of 1897, shows the satisfactory increase of 233,748 lbs. The average sale price of the crop was 9 9/16d. per lb., against an average of 10⅞d. obtained for the produce of 1897. The amount realised for the crop, notwithstanding the lower range of prices, was £5,354 in excess of the returns from the teas of 1897. The directors recommend a final dividend of 2½ per cent. on preference shares and a dividend of 5 per cent. on ordinary shares, leaving £229 to be carried forward. The estimates for the current year provide for a crop of 1,180,000 lbs., or an increase of 160,000lbs. on last season's outturn.

Attaree Khat Tea.—The crop, *viz.*, 836,414 lbs., fell short of the estimate by 83,586 lbs , being also 15,836 lbs., less than that of the preceding year. The average price obtained for the crop was 9 1/16d. per lb. The accounts show a profit, after deduction of commission to European staff, of £1,964 which, added to the amount at credit of revenue, gives a total of £5,989, from which it is recommended that a dividend be paid of 4 per cent. on the capital, leaving £3,319 to be carried forward.

Assam Frontier Tea.—The report for the year ended December 31st, 1898, states that the total crop was 3,444,940 lbs., which realised a gross average of 10·52d. per lb., as compared with 10d. per lb. in 1897, and 10·77d per lb. in 1896. The directors consider that the profit of £27,334, as shown in the crop account, is most satisfactory. The revenue account shows that after paying the 2 per cent. dividend on the preference shares accumulated from 1897, and an *ad interim* dividend of 1 per cent. on the preference shares on December 31st last. debenture interest, income-tax, and £5,000 towards the redemption of debentures, there remains an available balance of £13,286. The directors recommend a further dividend of 5 per cent. on the preference shares and a dividend of 4 per cent. on the ordinary shares, leaving a balance to be carried forward of £461.

Borelli Tea Co—Owing to a low price for tea, an advance of 9 per cent. in ocean freights, and expenditure upon buildings, the profit last year was only £431, being little more than sufficient to pay the preference dividend. Including the balance brought forward, the sum of £2,703 remains at credit of profit and loss, but this is so employed that it is not available for dividend.

Imperial Tea Co., Ld.—Whilst showing a net deficit of 247,072 lbs. on estimates, the actual outturn of 2,617,488 lbs. is 524,979 lbs. in excess of 1897. Of this outturn there was sold in Calcutta 1.839 931 lbs., at an average of 5 annas 6¼ pies, and in London 777,517 lbs , at an average of 7·693d, compared with 6 annas 1 pie, and 7·564d. respectively in 1897. Quality from Assam and Dooars was generally fair, but that from Sylhet and Cachar was exceptionally poor. Darjeeling teas again showed inferior quality throughout the whole of last season. The 600 acres estimated for have been added to the land under cultivation. The revenue account for the year, after crediting £1,106 brought forward from season 1897, shows a balance at credit of £7,017, of which the dividend on the cumulative preference shares at the rate of 5 per cent. per annum, absorbed £6,000, leaving a balance of £1,017, which it is proposed to carry forward.

Scottish Assam Tea Co., Ld.—The estimated crop for 1898 was 544,000 lbs., or about 59,000 lbs. more than the actual crop of the preceding year. The season ended, however, with a total crop of only 524,378 lbs., being an increase over 1897 of 39,012 lbs. The total revenue for 1898 has amounted to £21,547, and the total expenditure applicable to the year has been £19,818, showing a surplus on the year's transactions of £1,729. To this add balance (£184) brought forward from last year, making at credit of profit and loss account, as at 31st December, 1898, £1,912. The directors recommend that this be applied as follows:—In payment of a dividend of 2 per cent. £1,592, and to carry forward to next account, subject to deduction for directors' fees, income-tax, and commission to manager, &c., all for year 1898, £321. The directors trust, however, that the reduction of dividend will prove only temporary, and meantime it is satisfactory to reflect that during the last sixteen consecutive years the company has not only been able to pay an average dividend of fully 5¼ per cent. but has also during that time very considerably reduced the average capital cost per acre by additions out of revenue, besides accumulating a reserve fund of £4,000.

The Anglo-Ceylon Tea Co.—The profit on the year's working of the Company is £18,650 allowing a dividend of 4 per cent.

MARKET REPORT.

Per Mail Advices of 23rd June 1899.

COFFEE.

The *London Commercial Record* says:—At the commencemet of the week the tone of the market was very dull, and prices, except for fine qualities, shewed a declining tendency. Subsequently there was a rather better feeling, and with more competition a fair quantity, chiefly Costa Rica, was disposed of at steady prices, but yesterday tone became very quiet again. The bulk of the East India has again been of inferior quality, for which bidding has been very slow, but fine lots continue to sell fairly well. Jamaica and Mocha neglected. Owing to reported damage to the Santos crop by frost there was at one time a rise of about 1s per cwt. in the price of Brazil futures, but the improvement has not been maintained, and closing quotations only shew an advance of 3d per cwt., *viz.*:—

London ...	... Santos ...	Sept. delivery	... 28s. 3d
New York	... No. 7 Rio...	„ „	... 4·80 cents.
Hamburg...	... Santos ...	„ „	... 28½ pf.
Havre ...	... Santos ...	„ „	... 34¼ francs.
Holland ...	... Good ordinary Java ...		... 26¾ cents.

At the Dutch Trading Company's public sale on Tuesday in Amseterdam, 23,670 bags 20 cases sold at 26¾c. for good ordinary, against 28c. the valuation, and 27¾c. last sale.

Imports, Deliveries and Stock of Coffee in London are as follows:—

	Stock.		Imports.	
	1899.	1898.	1899.	1898.

	Home Consumption.		Export.	
	1899.	1898.	1899.	1898.
Tons ...	8,091	7,324	11,237	12,669

The preceding figures exhibit—

In the Imports an increase this year of ... ... 1,419 tons.
In the Home Consumption an increase of ... ... 767 „
In the Export a decrease of... ... ... 1,432 „
In the Stock an increase of ... ... 6,917 „

Auctions this week have passed off as under:—

CEYLON.—*Plantation.*—6 casks 6 tierces 2 barrels 1 bag sold, smalls 67s, low middling to middling 93s to 97s 6d, bold 102s, pea-berry 95s

EAST INDIA.—2,252 bags partly sold as follows:—*Mysore*—Smalls 26s to 38s, low middling to middling greenish 37s to 58s, middling dull colory 63s, bold 80s to 90s, pea-berry 43s to 49s. *Neilgherry*—Smalls 38s 6d to 47s 6d, low middling 44s, middling 58s good bold 80s, pea-berry 58s to 65s. *Nelliampathy*—Small 37s 6d to 42s 6d, low middling 49s to 50s 6d, fair to good bold 66s 6d to 71s, pea-berry 63s to 68s. *Shevaroy*—Smalls 40s, low middling 48s 6d, bold 60s. *Wynaad*—Bold cherry 41s 6d.

MOCHA.—41 half-bales retired.

JAMAICA.—166 barrels 154 bags bought in.

COSTA RICA.—5,799 bags mostly sold, smalls 26s 6d to 37s, fine 54s, good to fine ordinary 33s to 42s fine fine ordinary 42s 6d, low middling to middling blue 45s to 65s 6d, good middling 66s to 70s, good to fine bold 73s to 96s, pea-berry 33s to 76s

GUATEMALA.—4,955 bags partly sold, smalls 25s to 37s 6d, good to fine fine ordinary 32s to 40s 6d, low middling to middling 43s to 45s, good middling 50s to 58s, fine middling 76s to 77s 6d, fine bold blue 91s, pea-berry 38s to 83s.

COLOMBIAN.—2,050 bags partly sold, smalls 25s to 33s, good ordidary 32s to 32s 6d, fine ordinary to low middling 36s to 42s middling to good middling 42s 6d to 58s 6d, good bold 59s to 64s 6d, fine 81s to 85s 6d, pea-berry 38s to 56s 6d.

SALVADOR.—1,159 bags half sold—good to fine ordinary 32s 6d to 39s 6d, low middling to middling 40s 6d to 46s.

NICARAGUA.—415 bags sold, good to fine ordinary 33s to 36s, fine fine ordinary to low middling 37s to 41s 6d, middling 46s 46s 6d, bold 59s 6d, pea-berry 30s.

ECUADOR.—49 bags sold at 27s 6d for good ordinary pale.

BOLIVIAN.—20 bags sold at 29s 6d for good ordinary greenish.

GUATEMALA.—37 bags withdrawn.

MEXICAN.—Of 724 bags offered, 300 bags sold, triage 18s, small 32s to 35s, low middling to middling 41s to 50s 6d.

VERA PAZ.—297 bags sold, smalls 34s to 43s 6d, middling to good middling 50s 6d to 63s, good to fine bold 74s 6d to 95s, pea-berry 70s to 81s.

COBAN.—44 bags sold, low middling 44s, middling to good middling 50s to 58s.

BRAZIL.—29 bags Santos sold at 29s landed terms for bold pale foxy.

Receipts in Rio and Santos.

Since July 1	1898-9. Bags.	1897-8. Bags.	1896-7. Bags.	1895-6. Bags.
Rio	3,133,000	4,263,000	3,509,000	2,357,000
Santos ...	5,505,000	6,104,000	5,042,000	3,039,000
Total ...	8,638,000	10,367,000	8,551,000	5,396,000
Crop ...	—	10,461,000	8,680,000	5,489,000

To-day's catalogues comprised 756 bags East India, 5,193 bags Costa Rica, 592 bags Colombian, 160 bags New Granada, 639 bags Salvador, 297 bags Nicaragua, 100 bags Guatemala, and 277 bags Mexican. The sales went off irregularly; good coloury qualities sold well at full prices, but faded E.I. and common qualities were flat and lower.

Prices realized at auctions for some of the principal marks of East India—

TEA.

China.—Congous are in fair demand at steady prices. During e week 3,867 packages have been offered at auction and mostly ld as follows:—Oolong 7½d, common 4⅞d, Panyong 6¼d to 6½d, ingchow 6d to 9d, Kintuck 7¼d, Moning 6½d to 7¼d, Keemun 1s, ouchong 7d, Ching Wo 6¼d, Foochow 8d, Scented Caper 7½d, ekoe Congou 7d, Paklin 7½d; Green—Gunpowder 4⅝d to 7¾d, Sow ee 5¾d to 9d, Foong Mee 8d to 10¼d, Young Hyson 3⅞d to 7¼d r lb.

Indian.—As is usual during June public sales have been moder- e, *viz.*, 9,500 packages, of which 1,184 packages were new season's, mpared with 10,400 packages (3,800 new season's) last week, and 700 packages (3,600 new season's) in 1898.

This year's crop was chiefly represented by Darjeelings, and those ssessing point induced more competition, higher quotations being gistered in some cases. Old season's imports marked a firmer ndency for the upper grades and a weaker one for parcels under l per lb.

Catalogues included 780 packages of Travancore tea, mainly of eful quality, though they did not meet quite such a favourable ception as of late and results were lower.

For 963 packages (New Season's) on Garden Account 9½d per lb. as realised against 8¼d per lb. for 3,500 packages in 1898.

Ceylon.—Auctions were much smaller, amounting to 18,800 pack- ges, whereas on the 13th instant 25,900 packages were submitted, d 23,900 packages twelve months ago.

There was a good demand at a fractional decline for common ekoes and Pekoe Souchongs which occasionally touched 6½d per lb. air to medium leaf kinds also in most instances ruled easier, rtly due to the paucity of Continental orders, and to their being o light for many home buyers. Broken Pekoes, over 9d per lb., re again better supported, and a few stand out lots rose 1d r lb., owing to the scarcity of these descriptions from all quarters. The average is 7⅝d per lb. On the 15th instant it was rather er 7½ per lb., and 7¾d per lb. in 1898.

Java.—Nearly 2,000 packages, principally of direct import, passed e hammer, and although the greater portion were attractive in yle, prices, in sympathy with other growths, eased off a little. present 1,000 packages are advertised for next Monday and the d proximo.

Mauritius.—A small consignment from this island of a saleable aracter as regards both leaf and liquor was disposed of, consist- g of 55 half-chests of Orange Pekoe which fetched 7d per lb., d 64 half-chests Broken Pekoe 6½d per lb.

Deliveries.—The clearances of all Tea (on which duty has been id) from the London warehouses, as per official returns, were—

om 1st to 20th June, 1899	9,666,740 lbs.
„ „ 1898	10,659,474 „

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea port, dated June 23rd, 1899, says :—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
99-1900 ...	... 39,973 pkgs.	80,736 pkgs.	4,056 pkgs.
98-1899 ...	... 30,668 „	80,846 „	1,912 „

11,715 pkgs. Indian
19,375 „ Ceylon
1,908 „ Java
} Total 32,998 packages were offered in public auction this week.

The Indian Tea Association of Calcutta have recently published ailed figures showing the distribution of tea from Calcutta to ious places outside the United Kingdom, thus affording an amount of useful information which, if taken advantage of, may lead to the development of some new markets. The total shipped to these markets was lbs. 18,657,841 (1898-9), against lbs. 14,532,618 (1897-8).

The most important places where Indian Tea goes direct are shown in the following table, and in addition to the large markets of Australia, "Indian Ports" and North America, Turkey has taken a considerable quantity, as well as Persia, Arabia, Germany and Russia. It would be interesting to know the destination of the large quantity headed "Indian Ports," but probably a large portion of it goes from Bombay to some of the Asiatic markets in the neighbourhood of the Persian Gulf.

Direct exports of Indian Tea from Calcutta (in lbs.) to places outside U. K., 1st April, 1898, to 31st March, 1899.

Australasia	6,293,950	Straits Settlements ...	34,299
Indian Ports	3,919,018	Africa	34,436
N. America	3,232,027	France	26,294
Turkey	1,994,507	Norway	8,480
China	883,295	S America	1,000
Germany	526,418	Austria	4,145
Persia and Arabia ...	1,504,845	Other places	17,223
Russia	49,958		
Egypt	127,946	Total lbs.	18,657,841

Indian.—In Monday's small auction, the proportion of New Season's Tea was somewhat small, in addition to which a large quantity of second-hand Tea was included in the sale. Speaking generally, prices showed a disposition to give way, Teas from 7d. to 8d. being especially weak.

The official telegram gives exports to U. K. for first half of June as lbs. 5,430,000 against 3,750,000 same period last year, making the total from 1st April to 15th inst. lbs. 11,132,000, against lbs. 6,457,000 last year. An official telegram also states that too much rain has fallen in most Tea districts, but that in the Dooars and Terai the weather has been fairly favourable.

Week's av. of New Season's Tea sold on Garden Account 1899, 1,608 pkgs., av. 8·53d. 1898, 4,741 pkgs., av. 7·60d.

New Season's Tea sold on Garden Account 1st June to date 1899 6,973 pkgs., av. 8.04d. 1898, 10,032 pkgs , av. 7·46d.

Ceylon.—19,375 packages were brought forward, against 26,181 last week. The quality of arrivals recently to hand, as is frequently the case at this time of year, has been poor; the lower quotations this week are in a measure due to this fact, although prices have given way for most descriptions excepting for fine Teas, and there were more priced Teas selling at 6¾d. this week than has recently been the case, while in one or two instances 6½d. was paid. For the few fine liquoring Teas buyers competed with considerable animation, and in many cases a distinct advance was noticeable in price. The official wire from Ceylon gives exports to U. K. from 1st to 15th June as lbs. 7,700,000 against 4,500,000 same period 1898, and estimates the quantity available for the month as lbs. 12,000,000, against lbs. 9,750,000 in June, 1898.

Average for week 7·62d., against 7·59d. in 1898.

Ceylon Tea sold on Garden Account 1st Jan. to date 1899, 496,113 pkgs., av. 8·27d. 1898, 541,125 pkgs , av. 7·63d.

Java.—A fair selection was brought forward, but prices were generally inclined to be weak, a large quantity being withdrawn for higher limits. The highest average was made by 59 pkgs. Tannawattee, 8¾d. per lb., and 108 pkgs. Perbawattee 8½d. per lb. 650 pkgs. are advertised for sale next week.

Bank rate 3 per cent. Exchange on London three months' sight. Calcutta 1/4 $\frac{5}{32}$. Colombo 1/4 $\frac{5}{32}$.

IN AMERICA.

Messrs Osborn & Lindsey report tea market slow but steady. The business done is so small that the peddling system is the only term that can be used adequately in connection with the present trade, and this character has been maintained for the past two or three months. Formosa Oolong are most in favor along with Japans, but so far as Messrs. Osborn & Lindsey have been able to observe the Ceylon and India consumption is not increasing. Even at its abnormal figures, it really means 5 per cent. of the whole tea consumption.

COCOA.

Auctions on Tuesday offered 9,584 bags, and, as importers were desirous of clearing, at a reduction of 1s to 2s per cwt. fully 5,000 bags sold. Of 1,482 bags Trinidad catalogued 1,200 bags sold,

good to fine red 69s to 71s, middling to fair ditto 65s to 67s, being 1s to 2s below valuations. Of 4,174 bags Grenada brought forward 3,450 bags found buyers, also at 1s to 2s per cwt. depreciation: superior bright red 68s, good to fine ditto 62s to 65s, and common to fair ditto 57s to 61s. 139 bags Demerara about half sold at 65s for fine red. 241 bags Jamaica, 83 bags St Lucia, 465 bags Dominica, and 186 bags Surinam were withdrawn. 72 bags Puerto Cabello about half sold at 130s for superior, and 75s for No. 2. Of 858 bags Guayaquil about 120 bags sold at steady rates, greyish red Arriba 69s. 1,884 bags Ceylon were offered, but, the quantity of desirable quality being very small, only 280 bags sold, and then at lower rates, *viz.*, good bright medium and small red 74s 6d, Native mixed with small plantation 63s to 68s per cwt.

PEPPER.

Black.—The market is dull and value has declined this week. About 200 tons Singapore have been sold—at $5\frac{5}{16}$d. down to $5\frac{1}{4}$d for fair quality on the spot, at $5\frac{3}{8}$d. May-July shipment, at $5\frac{7}{16}$d down to $5\frac{3}{8}$d for June-August, at $5\frac{1}{2}$d for July-September, and at $5\frac{9}{16}$d for August-October.

At public sale on the 21st inst. 204 bags Penang were bought in at $5\frac{3}{8}$d. 54 bags Ceylon realised $5\frac{1}{2}$d for fine clean brown and $5\frac{1}{4}$d per lb. for good ditto, rather smaller.

White is also lower and dull of sale. About 60 to 70 tons are reported sold—at $8\frac{5}{8}$d for fair Singapore on the spot and at $8\frac{13}{16}$d for August-October (s.); at $8\frac{1}{16}$d down to 8d for fair Penang on the spot; for arrival no sales of the latter description reported.

Of 357 bags offered at auction on Wednesday, only 15 bags sold —fine bold Singapore 10d, fair limed Penang 8d per lb.

Nepaul.—8 cases yellowish (lying at a private warehouse) sold "without reserve" at 6d per lb.

Sweet Red.—8 cases were placed at 46s to 59s per cwt.

GINGER.

Cochin.—Last week's improved trading and prices have turned out extremely evanescent, although a sen'night back they bore the impress of stability. Speaking in round terms, no sales have been consummated privately since our last issue, and Wednesday's auctions only served to prove more definitely if possible that the market had had a bad relapse. Almost a dead calm prevails, and although it is hardly possible to register any tangible decline yet it would not be difficult for a wide-awake buyer to shade last week's currencies. The catalogues included 115 cases 682 bags of which 47 cases 105 bags sold, viz.:—small to medium, a little bold, roughly cut and scraped 40s to 41s, small ditto 29s to 30s, small to boldish hard brown rough 23s, medium and small ditto, but brighter 23s per cwt.

Jamaica.—919 barrels, &c., were offered, but there was little enquiry, and only 125 barrels, &c., sold at higher prices for good plump washed, but at 2s to 3s per cwt decline for other qualities Good bright plump 75s to 78s, fair ditto 70s, good medium 67s to 68s, ordinary to good ordinary 54s to 63s, dark Rhatoon 46s 6d to 51s 6d per cwt. *Barbadoes.*—4 barrels realised 57s 6d per cwt.

INDIA RUBBER.

Prices of fine Para are again higher, and not much offering; business in Bolivian, fine old up to 4s $2\frac{1}{4}$d, newer 4s $1\frac{3}{4}$d, hard fine Para 4s $1\frac{3}{4}$d, soft ditto 4s 1d, scrappy negroheads 3s $1\frac{1}{2}$d, Islands ditto 2s $7\frac{1}{2}$d. Peruvian neglected.

CINCHONA.

The Monthly Public Sales.—Tuesday's public sales presented a very small total of 717 bales, of which 520 bales were placed at an average unit of $1\frac{5}{8}$d, being fully equal to the values realised at the last Amsterdam auctions.

28 cases *South American* retired unsold.

Of 244 bales *Ceylon Cinchona* 155 bales sold, Succirubra chips and shavings $3\frac{3}{8}$d to 4d; Hybrid, chips $3\frac{1}{4}$d, root $3\frac{3}{4}$d per lb.

323 bales *East India Cinchona* catalogued, 250 bales sold, Officinalis chips and shavings $4\frac{1}{2}$d to $5\frac{3}{4}$d, ditto renewed $3\frac{1}{2}$d to $6\frac{3}{4}$d; R chips $4\frac{1}{2}$d per lb.

122 pkgs. *Java Cinchona* rather more than half sold, Succirub chips 6d to $8\frac{1}{8}$d; Ledgeriana chips $5\frac{3}{4}$d to $7\frac{5}{8}$d, branch 6d to $6\frac{3}{4}$ and root $4\frac{3}{4}$d to $7\frac{5}{8}$d; Hybrid chips 6d to $8\frac{3}{4}$d per lb.

We give approximately the quantities purchased by the princip buyers:—

	Li
American and Italian factories	60.2
Zimmer & Co.	21,5
Imperial Quinine Company	20,6
Druggists, &c.	4 2
Messrs, Howards & Sons	4,1
Brunswick factory	2,4
Total quantity sold	113,2
Bought in or withdrawn	36,2
Total quantity offered	149,4

The following were the prices paid for the bark which sold:—

Ceylon.—For fair succirubra chips $3\frac{3}{8}d.$ to $4d.$ per lb. was read obtained, and $3\frac{1}{2}d$ to $3\frac{3}{4}d$ per lb. for hybrid.

East Indian.—Officinalis chips sold at $2\frac{1}{4}d.$ to $3\frac{1}{2}d.$ per lb. for dark stem and branch chips. Some superior kinds fetched $4d.$ lb. For succirubra the demand was exceedingly active, and hi rates were obtained, most of the bark being purchased on Americ account at from $3\frac{3}{8}d.$ to $4\frac{1}{2}d.$—the latter price being for bold chi For hybrid of strong succirubra character $6\frac{3}{4}d.$ per lb. was paid.

Java.—This bark was in limited supply, and was eagerly co peted for at prices ranging from $4\frac{1}{4}d.$ to $9\frac{5}{8}d.$ per lb. Most of t bark was crushed and powdery root and stem for manufacturi purposes.

The cinchona-bark auctions to be held in Amsterdam on July will consist of 5,611 packages of Ledger and hybrid, 577 cases a 677 bales of succirubra. The stock in first hands at Amsterda consisted, on June 20, of 2,044 packages Government bark, a 8,259 packages private bark, including the quantity to be offer in the next auction.

SULPHATE OF QUININE.

Quinine has hardened up $\frac{1}{2}$d per oz. this week with only sm transactions. In all not more than 50,000 ozs. H&B or B&S report done—up to 1s $4\frac{1}{4}$d spot, 1s $4\frac{3}{4}$d August delivery and 1s 5d Octob The market at the close is firm, but quiet, and as the availa stock is now in few hands any renewal of speculative demand wou soon place the value on a higher platform.

(Average for all India 7·92d.) *June* 23rd.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittance should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 28th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Coorg.

Polli Betta, 17*th July*.—*Weather*—Light rain during the past two weeks. Between ·03 and ·10 inch latterly. High wind to-day as if indicating another advance of the monsoon, but the night is clear. *Plant diseases*—Removal of borer trees nearly completed. No signs of "leaf." Coffee looking fine. *Labour*—Plentiful. *General Health*—Good. Work on paddy fields, backward.

THE EXCHANGE QUESTION.

In our last issue, while remarking that a summary by cable could not be accepted as an absolutely reliable representation of the views expressed in a lengthy report, we commented upon the apparent neglect of the Indian Currency Committee in the matter of the requirements of India as an agricultural country, and its peoples as, for the most part, agriculturists. It cannot be supposed that the agricultural aspect of the Exchange Question has not been considered; but the summary of the report seems to treat it as a minor matter. The Indian Press also appears, to judge from its criticism, to be more interested in the question of the use of sovereigns as currency and the establishment of a gold reserve than in the probable effects of an artificially inflated Exchange upon the agriculture of the country. No doubt, this is but the natural sequence to what has gone before. The mercantile view of the Currency Question has from the beginning received more attention than that of the producer, and the deliberations of Government have been swayed by the opinions of the merchant and the

official financier, rather than by any consideration of the interests of the country as a whole. The first thing that attracted the serious attention of Government to the rupee was not any ill effect that a decline in its gold value exercised, or was supposed to exercise, upon trade, but the alarming increase in its own annual expenditure and in the rupee equivalents of its many sterling liabilities. To set this right, Government would no doubt have gladly fixed the rupee at par; but, ere its slow machinery got fairly to work, the fall in silver had become a collapse, trade had been disorganized thereby, and any sudden hoisting up of the rupee from the depth to which it had fallen would have caused a commercial cataclysm However, the Government compromised—at first temporarily; and now permanently, by essaying to fix the rupee at 1s. 4d.

When the proposal to close the Indian mints to the free coinage of silver was first put forward, there was a deluge of criticism, favourable as well as unfavourable. Time has served to show which portions of this were sound, and much that was then written might be reprinted with advantage now, if the question at issue were the general one, whether an uncertain or a fixed exchange is preferable. Gradually, however, the discussion wandered away from this point. Most men granted that certainty was better than uncertainty, and the next point considered was the level at which the fixture should be made. Studying its own needs more than the needs of the country, the Government of India at last made a trial of a 1s. 4d. rupee. We are not aware that the Currency Committee has attempted to gauge the effects that this has had upon the agricultural industries to which India mainly owed its past prosperity. As far as we know, no official attempt has been made to study "progress" during the period of the closing of the mints. It is perfectly clear that Government itself has benefited: its finances are in a more satisfactory condition than they were a few years ago; but this has been brought about by no magic on the part of the State-aided rupee, but by the imposition of additional taxation. This, again, has fallen heavily upon the agriculturist. During a period of low exchange he obtained high prices for his products, he was thus led into purchasing imported cloth, &c., for it is the nature of man that his requirements should increase with his resources. Now, the agriculturist in India is artificially deprived of a portion of the advantages that might have been his, and, at the same time, he has to pay more for the European cloth he has taken in place of former "country-made" textiles, because of the import duty that has been imposed.

The Tea and Coffee industries alone, among the producing industries of India, have consistently criticised Government's action. The other industries have been represented solely by the "voiceless millions." Yet it is not the Tea and Coffee industries alone that have suffered. If Government will study the course of India's cotton industry during the last few years, it may acquire a general idea of what has occurred. When the mill industry expanded, demand for Indian cotton naturally increased; but the resources of the country are great, and there was no reason why the supply should not be increased sufficiently to meet the requirements of the Export trade as well as those of the Indian mills. Has this occurred? On the contrary, in several European countries, the consumption of Indian cotton has decreased *on account of the high price* of this staple. America has ousted it. The trade that formerly flowed West now flows East, and India, fortunately for herself, finds, in alien Japan, a market for the produce that have been expelled from Europe by the financial policy of the Government of India. As for Coffee—Brazil, with an exchange that has fallen from, say, 2s. 3d. to under 6d. and that now stands under 8d., is in a position to undersell India all the world over, and is gaining ground daily. The prices of Indian coffee have been forced down to a level, that is, generally speaking, unprofitable, and yet Government would doubtless argue that this is not due to the manner in which Brazilian Exchange has fallen and Indian been forcibly propped up. That other influences have been at work, also, we do not deny; that a one-sided view of the Currency Question must necessarily be misleading is certain. But what we assert is that Government first, and, afterwards, the Currency Committee have not attached due weight to the agricultural needs of India. Probably a decade will have to pass before the matter can be put to the proof; but we submit that the statistics of the past seven or eight years give a general indication of what may be expected from those of the next ten. They are not statistics that point to increasing prosperity.

PEPPER.

We are nervous about commenting further on the boom in Pepper, for already at least one planter has jumped to the conclusion that it would be a fine thing if tea, coffee and all other products were abandoned, and pepper grown in all available land. He does not quite express himself in this way, but what he says points to something of the kind. Of course, if there is anything like a rush to grow pepper the inevitable fall of prices must come. However, we are glad to learn from London that one of the principal features in the latest Spice sales, of which we have advice was the large quantity of Tellicherry Pepper offered for disposal. The bulk of about 1,000 bags found buyers at 5⅛d. landed—a fact which, in the present quiet state of the market, must be regarded as a most astonishing sale. Hitherto it has always been said that Tellicherry Black, either for arrival or on spot, could be disposed of only in a rising Black Singapore Pepper market. But Tellicherry Black has been growing in favour, and now about 1,000 bags have found buyers at a time when black descriptions were stagnant. The *London Commercial Record* comments on the rapidly extending operations on this Pepper for forward delivery and says:—"We can hardly remember a time when Indian shippers have been courageous enough to test our market with consignments of such magnitude. The Continent, principally Havre, used to be the destination and recognised market for black Tellicherry consignments and shipments, London being always considered the most unfavorable field for unsold parcels. The first attempts at trying our market with consignments of some importance will, we feel satisfied, be followed in the ensuing season by many more similar ones. Not because the prices realised have been exceptionally brilliant, but simply because the cultivation of Pepper in India has received an impetus by the increased demand and the enhanced values established this season, and because London has shown that it is now in a position to dispose of large quantities of Tellicherry

Ve are informed on good authority that the cultivation of epper is receiving serious attention on the part of Coffee lanters who, in planting and cultivating this spice, see a hance of escaping the ruin threatening them by the normous decline in the value of Coffee. In some instances, e understand, Pepper planted as a bye-product has been he very salvation of some luckless Coffee estates." Our ontemporary even adds that "It does not follow that y an increased planting-area the value of Pepper must ecessarily decline, for with the steady diminishing supplies f black Singapore the demand for and consumption of lack Tellicherry in the East will steadily increase." But his depends on the *extent* of the increase and we must ommend to our readers St. Paul's advice about "moderaon in all things."

The following figures may be of interest:—

Exports of black Tellicherry during the month of May.

	To India.	To Europe & America.
1899	about 530 tons.	about 265 tons.
1898	„ 350 „	„ 50 „
1897	„ 90 „	„ 835 „

Total exports from 1st January to 31st May.

	To India.	To Europe
1899 ...	...about 1,730 tons	about 2,525 tons
1898 ...	... „ 2,191 „	„ 690 „
1897 ...	... „ 1,030 „	„ 4,640 „

BLACK AND WHITE PEPPER (INDIGENOUS TO NORTH QUEENSLAND).

(By "Diogenes.")

I.

I have been much interested in the various articles and nquiries on this subject, especially those cuttings from he *Straits Times*, a "low country planter in Ceylon" nd "Mensu's" enquiries. The two former, as nearly as ossible, answer the latter's enquiries, and appeared in the *lanting Opinion* of February 4th and 7th respectively.

The mistake that "Mensu" has made is evidently in usting to seed germinating, where, by his own admission, oted cuttings are abundant on the ground, or, on the ther hand, if a new seed was necessary, in not obtaining from the Straits or some other district, and then carelly nursing it under shade until fit to plant out. Next, drying *seed*, it should never be dried entirely in the sun: few days in the sun just to shrivel the pulp is ample, the est of the curing should be done in the shade, and not too uch even of that. Then raise in a well-sheltered nursery nd he will have more like 99% of success. This, with best ishes, to "Mensu" from "Muliga."

While interested in the above I was much amused at our reprinting our (Queensland) Popular Botany on the ubject of Pepper from the *Q. A. J.* Fancy making *white epper out of black by simply letting it ripen before it is icked*, and then going-off into a long-winded screed on the ubject of Aleric and the Wisgoths (whoever he or they ere) taking part payment of their war indemnity in ,000 lbs. of pepper. The writer also informs us that this as 1,490 years ago; so, if Mr. Aleric is not dead yet, we re all hoping that he will give us some *useful* information e Pepper. The rest of the information we get from this epartmental wiseacre is, "How it is grown in India," nd he winds up by saying, "This would prove a good "way of trying this plant in the scrubs, near the margins "of some of our northern rivers." Now, we have no less than four distinct kinds of indigenous pepper already here in our scrubs, of the existence of which "Popular Botany" knows nothing. From one of these varieties, the writer last year cured a sample of "Black Pepper," and sent it to the "Minister for Lands;" but, needless to say, neither he nor any one else have heard anything more about it. Doubtless some departmental know-nothing will discover it after the Wisgoths conquer Queensland.

The five indigenous "Pipers" we have here, as far as I have at present discovered, I will endeavour to describe (unbotanically of course); but I have taken care to obtain their botanical names, for which I am indebted to Mr. F. Manson Bailey, F.L.S., Government Botanist of Queensland, as I like to have a name for any pet or fad of mine, be it dog or donkey, Possum or Member of Parliament.

I. *Piper banksii.*—This is a creeper found growing prolifically in all the northern scrubs, even as far south as within fifty miles of Brisbane. It has dark green, heart-shaped foliage, and is seldom found bearing fruit, except at the margins of streams or roads, where sunlight and air have been let in. In the dark primeval forest the creeper will frequently be seen ascending a giant tree without a leaf to indicate its genus; but, if that tree is felled in July or August, the creeper will be found in full crop among its sunlit branches. An old abandoned bullock-yard in the scrub is a sure place to find both this and other kinds, in bearing, near the ground; hence it is not so much water, as sunlight and air, that it requires. On felled and burnt scrub-land pepper is seldom, if ever, seen again spontaneously. The fruit of this variety I can best liken to a bunch of ripe red currants, only that the currants are opaque, not semi-opaque, like the English fruit; in fact, each fruit is like a Holly berry. Last year's sample I cured from this variety and the process I used was the same as I used in Mysore over twenty years ago. The result was a pretty, rather small round, crinkly, shotty, black, which would have obtained notice in the London market, and a fair price.

II. *Piper novæ hollandiæ.*—This variety is very similar to the above in the shape of the leaf, but of a somewhat darker green, and closer stem joints. The fruit, however, differs considerably, the bunch of fruit standing out direct from the flower-stem, and the whole bunch forming a cone. It appears somewhat more pungent than *Piper banksii*, but this I have not thoroughly tested, but intend doing so this year. It is far more scarce than the above, but is evidently a better cropper.

III. *Piper triandrium.*—This is a very scarce variety, the leaves differ in being more eliptical than either of the above; but the fruit differs entirely, being set in three distinct rows close up to the flower stem, and somewhat flattened upon it. I have not yet seen a bunch fully ripe; but the berries are of a metallic blue to green tinge. When cured, it has a peculiar spicy flavour of its own.

IV. This is another distinct variety that I have only just found and a sample is on its way to the Botanist to be christened. It is a very robust and large leaved variety. I have not yet seen its crop; but the leaves have the self-same property and appearance as the *Piper fragrans* or "Betal-leaf," so dear to the heart of the Mysore coolie or even the high-caste Brahmin.

I do not know if the fruit of the Betal *Piper fragrans* is utilized in India, but I remember seeing it grown in Areca Palm swamps for the sake of the young and tender aromatic leaves.

V. *Piper sulpheltatum.*—This is entirely different from any of the above, and is a ground or standard shrub, not a creeper like all the above. It has large heart-shaped leaves and closely jointed stem. I first noticed it through its likeness to the plant from the root of which the South Sea Islanders make their "Kava" or "Angona," botanically known as *Piper methysticum*, but it turns out to be only another variety of the same thing. Out of these five indigenous peppers I am convinced that three at least can be made into a marketable product, and it would be interesting to know if the variety grown in the Straits is the same as that grown at, say, Tellicherry, as I am inclined to think that they are not all *Piper nigrum.* "Mensu" should kindly take notice of the wild pepper, which I am aware is to be seen in all the jungles round Saklaspur and down the ghât past Beltungady and Upununygady, and note, when the crop is visible, any difference in the shape of leaf or mode of growth in the fruit, if any. In any case, he should send a sample to the nearest Botanist of any wild pepper to be found, as I think it quite possible that he will find that it is not *Piper nigrum* or, if it is, there are probably other varieties which it would pay him to watch, as it is by no means certain that *Piper nigrum* is the best, or what the London market would like best.

MAY COFFEE MOVEMENT IN THE UNITED STATES.

The deliveries of coffee in the United States during May were, says the *American Grocer*, the lightest for any month since November last, except February of this year. They were 493,347 bags, against 524,021 bags in April, and 471,199 bags as the monthly average for the present trade year, and 537,982 bags average monthly deliveries since January 1, 1899.

The deliveries in Europe were 759,764 bags, against 688,118 bags in April, and 648,898 bags as the monthly average for eleven months of the present trade year.

The following statement shows the combined movement in Europe and the United States for the month of May:

	Bags.	Bags.
Stocks, May 1, 1899—		
United States	1,235,721	
Europe	3,867,473—	5,103,194
Receipts during May—		
United States	573,380	
Europe	745,839—	1,319,219
Total supply		6,422,513
Less stocks, June 1—		
United States	1,315,754	
Europe	3,853,548—	5,169,302
Deliveries, May		1,253,111
Deliveries, April		1,212,139
Deliveries, March		1,316,514
Deliveries, eleven months, 1898–99 ...		12,321,065
Deliveries, eleven months, 1897–98 ...		13,534,767
Deliveries, eleven months, 1896–97 ...		11,163,521

The total visible supply on June 1 was 6,261,302 bags against 6,341,194 bags on May 1 (a decrease of 79,8 bags), and 5,475,022 bags on June 1, 1898; 4,173,943 ba on June 1, 1897; and 2,444,949 bags on June 1, 18 The maximum visible supply was on November 1, 189 when it reached 7,128,800 bags, or a reduction in seve months of 867,598 bags.

The total receipts at Rio and Santos for eleven month were 8,229,000 bags, against 10,109,000 bags at same tim the previous year.

The market ruled steady throughout the month at 6 @ 6½ cents for spot No. 7 Rio. The lowest price on th Exchange was 4·80 cents for June; highest, 6·10 cen for April.

THE 1-lb. DRAFT.

The following circular was lately issued by the Secre taries of the Indian and Ceylon Associations, London:

1-LB. DRAFT ALLOWANCE ON TEA.

The Joint Committee of the Indian and Ceylon Associa tions in London appointed to deal with the question of th abolition of the 1-lb. draft on tea sold at public auction i London beg to report as follows: On April 26th last a circu lar was issued to tea growers and importers, by the Join Committee, setting forth the principal reasons why, in th opinion of the Association, the draft allowance should b abolished, and requesting those who approved the propos to signify their assent by returning the paper duly signe and stating the weight of tea the signatories represented The Committee have received assents from tea companie firms, and individual growers and importers representin 211,298,000 lbs. of Indian and Ceylon tea, and this is exclu sive of replies from Ceylon which have yet to be received Last year the amount of Indian and Ceylon tea importe into London from these two countries was 227,283,000 lbs so that taking into consideration the number of smal growers and importers the Committee were unable to reac the response in favour of the proposal may be taken as being practically unanimous. On May 24, the Wholesale Te Dealers' Association proposed that your Committee should meet them and discuss the subject, and in reply were advise that your Committee would be pleased to meet them at date to be fixed later on.

The dealers, retailers, and grocers' representatives, how ever, held a meeting at the Commercial Sale Rooms i London on June 7, and passed resolutions condemning an proposal to abolish the draft allowance and formed a specia Committee to protect their interests. The lengthy proceed ings of that meeting have been published. The propose meeting with your Committee and the wholesale dealers fixed for June 21, was cancelled by the latter body, and meeting was arranged with the Special Committee represent ing the wholesale and retail tea trade. At that meeting which took place on the 26th instant, the representatives o the trade stated that the conditions of their trade would not allow of any change being made and confirmed the re solutions passed at the meeting of June 7, and they further stated that, if importers persisted in carrying out th proposal, it would completely disorganise the tea trade of th country and could not but cause loss and inconvenience to al

concerned, and expressed the hope that the situation would be seriously considered before the importers adopted a course which they intimated would be strenuously resisted by the trade. A lengthy discussion followed, but your Committee regret to report that no settlement could be arrived at, the Special Committee representing the buying trade refusing even to consider the question of any compromise. Whilst the form of agreement signed by importers gives the Joint Committee power to act, should they consider it advisable, they have felt that the exact position of affairs should be made known by them to importers at a general meeting, which it is decided to hold on Monday, July 3, at the Chamber of Commerce, Eastcheap, at 2-30 p.m. Signed for the Committee by joint secretaries, Ernest Tye, Secretary, the Indian Tea Association (London); Wm. Martin Leake, Secretary, The Ceylon Association in London.

Calcutta telegrams, dated 13th instant, state that at the Tea Sales on the 17th instant 20,258 packages were offered, and 11,496 were sold. There was a good competition for suitable teas for Colonial and Foreign markets at fully last sale rates, about 7,000 packages being taken off the market. Common pekoe souchongs were a shade easier. The sales were held on the following conditions:—That buyers guarantee to ship tea only to markets other than the United Kingdom, and that all teas bought for London shall be held here until the 1-lb. draft dispute is settled.

On the 14th instant, at a Special General Meeting of the Indian Tea Association, Calcutta, the following Resolutions were adopted:—"That the meeting is in favour of holding sales for outside markets only for the present." (2) "That the opinion of the Indian Tea Association, London, as to the question of stopping all exports of tea for London, be invited."

From London next day came advices that forty-eight Ceylon estates were offering tea for sale, and that much Indian tea was also announced for sale at the auction on Monday the 17th instant. At that sale Assam and Java teas with the draft allowance were plentiful. Prices were below the average. The sale of some tea without reserve and with no draft allowance is advertised for the 24th instant; but if dealers keep up to their word, no offers will be made.

On the 19th the following telegram was received at Calcutta from the Indian Tea Association:—Delay shipments as long as possible; delay sales this month. Sales yesterday second hand, mostly withdrawn; 2,000 chests will be offered at next sale, 24th July, without reserve or draft sales. Do not re-commence till 14th day of August; Committee will regulate further offerings. Colombo arranging to restrict sale. With the exception of one Ceylon importer all are quite firm." At the Meeting of the Indian Tea Association at Calcutta on 19th instant a resolution was passed condemning the failure of Ceylon to support London and Calcutta. The Association further resolved to hold no sales in Calcutta this week, but to resume ordinary sales without restriction on the 28th instant. It is assumed that this will meet the wishes of the London Association.

From Colombo, advices, dated 15th instant, bring us news that the following resolutions were passed on 14th instant by the General Committee of the Planters' Association assembled at Kandy:—(1) That this Committee will use their influence to withhold teas for sale for London Markets until such time as the pound draft dispute is ended. (2) That this Committee request the Tea Traders' Association to suspend the sales of tea held under the present conditions, and substitute auction sales under special conditions corresponding in other respects to the former conditions, but with the addition that teas shall not be delivered for London until the London sales are resumed, and that until such time all Proprietors, Directors of Companies and Agents representing absent Proprietors, be urged to support the action of the Ceylon and Indian Association in London. (3) That the Indian Tea Association be requested to cable the conditions of recent sales.

Later news, dated 18th instant, states that by the Planters' Associations' Resolutions already telegraphed, the Colombo Tea Traders' Association had received the following cables:—London—telegram to Colombo says:—"The Public auctions are weakening the position; strongly urge Calcutta to plan private auctions for foreign markets." Telegram from Calcutta says:—"Are you holding sales this week, if so under what conditions? Please wire to-day." Consequently a special General Meeting was convened for the 19th, immediately preceding the usual weekly sales.

On the 19th it was reported:—The Tea Traders' Association to-day threw out its Committees motion that the present auction sales should be suspended and that brokers be requested to hold private auctions under such conditions as will meet the requirements of the Resolution passed by the Planters' Association. To-day's sales, therefore, have proceeded without restriction.

TEA FROM SEED TO CUP IN SOUTHERN INDIA.

(By Thomas Brown, Glendale, Coonoor.)

VI.

Care of the Young Fields.—The fields must be kept perfectly clean of weeds, or the percentage of failures will be very large from this source alone. Care must be taken that stones and rubbish are not allowed to get on to the plants or into the drains. We will suppose that your planting has been completed at the end of November. No attempt at opening up the shade must be made till the spring showers of April have fallen, when the tops can be opened out a little allowing the plant to grow out. The shading may then be allowed to rot away of itself. Sudden exposure of the plants causes blistering of the leaves and death of a large number of the plants.

Nurseries.—We find it difficult to remember all that might be said upon each subject when it is being dealt with and will have frequently to recur to the same subjects again, as fresh points come to our mind. Just now we remember visiting the nurseries of a Tea estate in which, after the plants had been pricked out into beds, some ferns had been stuck in as shading and the beds had been so left from December to April, the result being, thready little, bleached plants, that were fit only to throw away. We had been at a loss to account for the almost complete failure of thousands of plants that had been annually put out and the weak slow growth of such as survived and found in this condition of the nurseries, the full explanation. Such shading is advisable for a fortnight or three weeks until *pandals* can be erected.

Germinating Bed.—Be careful that all seed is put out, as soon as the radicle is an inch long. Examine your bed from time to time, after the sixth week and remove all germinated seed for putting out into beds, returning the remainder to the same place. This disturbance of the seed seems to be beneficial rather, than otherwise.

Red Spider.—That is a very great trouble. Now-a-days is almost sure to appear upon the young plants about August. We have found that mixing half an ounce of nitrate of potash and superphosphate mixture to a can of water, and watering the young plants with the solution, helps them to overcome the results of the damage from these mites. We do not propose, in this work, to deal with pests and remedies (except in a very casual way), as Dr. Watts' excellent work on this subject deals more learnedly and exhaustively with it than we can ever hope to do, and the young planter cannot do better than invest in a copy at once. Another excellent work, which ought to be in the hands of every agriculturist, is "The Chemistry of the Garden," a Primer by Cousins, Publishers, Macmillan & Co., New York. A mixture advised in this work, called the Wye mixture, a modification of the now well-known and famous Bordeaux mixture, would, we fancy, be found an excellent remedy against the Red-spider in nurseries and upon young plants on the field. The application to old trees is rather expensive, and the work can hardly be efficiently done. The Wye mixture is as follows :—

Blue-stone	1 lb.	10 gals. water.
Lime	1 „	
Agri-treacle	1 „	

Boil the lime and treacle in a quart of water and add, when cold, to the blue-stone dissolved in the water previously.

We trust that these hints may be of some immediate benefit to the readers of *Planting Opinion*.

NOTES.

Tactics. It is asserted that London dealers lately, "as a piece of bluff" put up some Ceylon and Indian teas and thus made up "a moderate auction." Not a bad idea!

Erythrina Lithosperma. The question of the *quality* of coffee produced on old soil manured solely by means of this leguminous tree is still unsettled. It would be interesting if those who have made experiments with the tree would now begin to jot down their experiences for the benefit of their brother planters.

Bulking on the Estate. The *I. P. G.* refers to satisfactory prices realised by the Doom Doom Tea Company as chiefly attributable to bulking on the gardens; and remarks :—"What we ought to devote attention now to is the placing on the market teas of a uniform blend to suit all buyers; in fact, less science and more practical work."

The Destruction of Locusts. The "Imperial Bacteriologist" (ye gods, what's in a name!) has obtained from South Africa a culture of the fungus which is said to have been found very efficacious in destroying swarms of locusts in that country and has suggested that district and other officers be informed that cultures with instructions as to their use will be supplied on application.

Packet Tea. A Calcutta contemporary rightly says :—"Regarding the sale of garden put up packets (or tins), a great number of our planters might create a trade in such by urging upon their friends and relatives at home, the help they would give in popularising the use of Indian tea by recommending its adoption among their acquaintances." The difficulty here lies in the fact that estate packets (or tins) do not contain *blended* teas, which are usually preferred.

Colombo Tea Sale. At the public sales of tea at Colombo on 12th instant about 8,5[illegible] pkgs. = 682,610 lbs. were offered, of which about 7,32[illegible] pkgs. = 578,659 lbs. were sold. Despite the fact that there are not any tea sales being held in London, all tea in the auction met with keen competition, the prices ruling being fully up to previous rates for all grades. Among the best teas in the sale were Iona, High Forest, Sutton, and Errollwood.

Bored Trees. The Coorg correspondent of the *Planter* advises all those in Northern India who have borer to deal with to cut the stems of the affected trees down to within a few inches of the ground and thus give them another chance. The chances are that the stumps will have no grubs in them, occurring as they mostly do in the stems, and they will throw up suckers which will make decent sized trees in a year, and thus fill up gaps much sooner and more satisfactorily than supplies.

Paratriptics. Tea, coffee, and tobacco are classed by scientific men under the designation "paratriptics." Their use is based upon their power to prevent waste in the body. They are mild stimulants that enable men to do more work and endure more privation with a smaller amount of actual food. Tea, coffee and tobacco are not food, although temporarily and continuously they supplement it. The physiologist Moleschott calls them the "savings banks" of the tissues. Used in moderation, they have for many people a beneficial effect.

Divided Houses. A house divided against itself cannot stand. Some alarm has been

aused by the announcement that certain Ceylon and ssam teas are being put up to auction notwithstanding he dispute about the 1-lb. draft. Fortunately, perhaps, here is as much division among dealers as among nporters, for the "Tea-*cum*-paper" weight question has aused a good many to range themselves together against he great Lipton. That dealer's counsel declared that it vas the custom of the trade to include the weight of the aper when regulating the 1-lb. packet; but a number of thers have declared this to be a libel on themselves and heir fellows.

---

ssam.

Capital says:—Very heavy floods are reported from the Sibsaugor istrict, where the water has burst the Dehing and Desang unds, and a large tract of country was submerged, causing onsiderable damage to crops, especially early rice. The oods are now subsiding. The heavy rain has also caused loods in the districts of Goalpara, Kamrup and Nowgong. he prospects of tea have much improved in the Sylhet nd Cachar districts. In Kamrup the plucking of tea has een delayed owing to excessive rain and too little sun; ed spider is still prevalent in this district. In Darrang, ibsaugor and Lakimpur districts more sun is required lthough prospects are improving.

---

he American and Foreign Market Fund.

The Secretary of the Indian Tea Association (London) states that his Committee lately passed a resolution appreciating the manner in which Messrs. James, inlay and Co. are pushing the sale of Indian tea in merica, Russia and Turkey, and agreeing to subsidise heir Agents on a basis similar to that of last year, provided that the new levy is equally well subscribed to. This would make a beginning in the opening out of the Russian Market, while the Paris Exhibition would afford an opportunity for making Indian teas better known in France. he work in America would be carried on in conjunction vith the Ceylon Planters' Association through their representative Mr. Mackenzie.

'ea Consumption in Germany.

Mr. Frederic Harford, Second Secretary in Her Majesty's Legation at Münich reports that the consumption of tea in Germany, which averaged 05 kilo. per head p till 1897, rose to 07 kilo. per head in 1898, and the nports of tea from 2,660 tons in 1897 to 4,116 tons in 898. This increase is chiefly due, he says, to the import f tea from China, rising from 1,661 tons in 1897 to 2,593 ons in 1898, from which it would appear that Indian teas re not so much appreciated in Germany as Chinese teas. n any case coffee is still the national drink of Germany, nd not tea, *which is twice as dear as it is in England.* Ve italicise the last few words, as a hint to South Indian lanters.

---

ifting and Sorting.

It is difficult to know, writes a planter to a contemporary, how to ift and sort one's teas. At one time the trade takes a ancy to some particular grade because it is "whole leaf," r because it is "tippy," or because it is something else, nd there is a run on it just for the time, but just when we ink we have struck oil and hit on the right way of sifting nd sorting for the market, we find the caprice of the hour has changed, and the teas for which we hoped to get a good price are "not wanted." The above observations are just, but so long as blending in India is impossible we should recommend each planter to use his own judgment as to sifting and sorting, and not to try to meet the varying requirements of markets by following the guidance of broker's reports.

Tobacco in the Tea Districts.

Mr. H. A. Pickford, late Manager, Pusa Tobacco Concern, has suggested that experiments should be made with a view to testing whether tobacco of a marketable kind could be grown in the tea districts, and has offered his services in the event of such experiments being undertaken. Mr. Pickford is of opinion that it would be possible in some districts to grow such tobacco, and he thinks it is a crop which might be cultivated as supplementary to tea in Assam and the tea districts generally. The Indian Tea Association has declined to take the proposal up, but has forwarded a copy of Mr. Pickford's letter on the subject to Mr. Buckingham, C.I.E., Chairman of the Assam Branch, for information and for such action as may be considered necessary.

A Tea Scientist.

Dr. Watt's remarks on this subject are given elsewhere. It will be seen that he thinks there is work for several scientists for a lifetime, not merely for one for a brief term of years. In this, planters will heartily agree with him, but if the Northern India tea men cannot settle the question wholesale, they may as well make a start with some particular branch of it. A demonstration by some specialist of the advantages gained by means of his investigations might possibly induce the Government of India to bring itself into line with modern progress in regard to matters scientific. Planters in Cachar appear to think that a start should be made with an entomologist, as they consider the question of pests and blights the most important. The Assam men want him to have some knowledge of bacteriology.

Draft.

When the 1-lb. draft allowed in London was complained of, Colombo and Calcutta sales were referred to as "so honest." Now, a planter in Ceylon contends "that we sellers lose 3 lb. tea on every grade we send to Colombo for sale. If I send a 50-lb. half-chest for sale, I only get 47 lbs. I have been a seller of teas in Colombo for twelve years, and for ten years and three months there was no draft or "sampling allowance." I enclose you two sales list for you to see, one March 1898 and one April 1898. In the former you will see there is no "sampling allowance" kept off, but from that date we have lost 3 lbs. on each grade, however small the package. This is a new tax on us from April 1898 until now." Whatever else it does, the tea-fight will certainly cause various hitherto submerged grievances to come to the surface.

Local Tea Sales.

The *I. P. G.* remarks:—The Indian Tea Association seem to consider that the retailment of tea among the native population presents insurmountable difficulties—an opinion in which we are by no means inclined to concur. Great headway in creating a taste for tea has been made among the lower orders, such as *ghariwallah,* boatmen, and people of that

grade. Domestic servants, as every housekeeper knows, appreciate the morning and afternoon cup quite as fully as their masters and mistresses, but it is only these latter that, in all probability, ever taste tea properly made. At both the Medical College and General Hospitals the large staff of attendants get their panniken at the same time as the patients do, according full justice to it, and these being of the lowest caste (or rather none at all), our impression is that if kiosks were established in the vicinity of those intramural *bustees* inhabited by these sort of people, where tea could be dispensed by properly-trained men, the demand would expand with rapidity.

Cinchona Grafting. In his recently-published Volume X of "Quinological Studies," Mr. van Leersum, the Director of the Government Plantations in Java, mentions some peculiar results observed in the propagation of cinchona by means of grafting. His researches have confirmed the previously known fact that *Ledgeriana* grafts derive cinchonidine from the lower stem of the *succirubra* plant upon which the *Ledgeriana* had been grafted, whilst conversely the *succirubra* grows richer in quinine. Mr. van Leersum also found that the influence of the *succirubra* was strongest at the lower part of the graft, decreasing at a distance of some 6 or 8 inches, until at about 12 to 15 inches from the joint it was practically *nil;* and, further, that the richer in quinine the graft the greater also the quinine-contents of the lower stem of the *succirubra*. The practical result of Mr. van Leersum's researches is therefore that such *succirubra* root-bark is not, as hitherto considered, valueless, but, on the contrary, should well pay the trouble and expense of gathering it.

Tea Statistics. Announcing the Incorporation of the U. P. A. S. I. under the Indian Companies' Act, the *Planter* observes:—"Periodical and accurate statistics of exports of tea from Southern India (as from other tea districts) are urgently needed, and we trust the new Association will furnish the Indian Tea Association with the same, as well as keep closely in touch with it in all matters relating to the interests of the tea industry in the South. Northern India should follow suit. We have before pointed out the necessity for the Planting Associations in Northern India supplying the Indian Tea Association with full statistics regarding tea in their part of the world. At present the statistics relative to both Northern and Southern India, published by the Indian Tea Association are most unsatisfactory, and we would, therefore, once again, draw the attention of Secretaries to this most important matter." Unfortunately, statistics cannot be made by Secretaries unaided, and so long as planters decline to supply the necessary figures, Associations cannot furnish reliable statistical statements.

Tea at the Paris Exhibition. The estimated cost of the arrangements tentatively proposed by the Indian Tea Association (London) for the display of tea at the Paris Exhibition is £6,600, and the space to be allotted is about 1,960 square feet This comprises two verandahs for the service of Indian tea in the cup; two tea rooms, one in the Indian Imperial Court, and one in the Private Exhibitors' Court, for the exhibition of samples of tea, photographs of tea estates, machinery, etc.; and two tea kitchens. These proposals had been considered in circulation by the General Committee, and on the 22nd of June they addressed the Government of India asking for a grant-in-aid of £6,000. In this letter the advantages derived from other similar exhibitions in the past were set forth; it was also stated that all the expenses in connexion with the representation of Ceylon tea, amounting to £10,000, were being paid by the Government of Ceylon and it was urged that it was the highest importance that India should be as well represented as Ceylon, which would be impossible without liberal assistance from Government. In response to these representations and with a view to assist the effective representation of the Tea industry at the Paris Exhibition, the Government of India have agreed to meet any expenditure falling against the undermentioned heads of the Association's estimate within the limit of a sum of £3,250:—(1) Open air space and royalty. (2) Space in courts and royalty. (3) Decorating and furnishing. (4) Carved wood screen, and also to pay a sum of £750 towards other expenses.

Sale of Nilgiri Estates. Mr. T. C. Anderson has sold his Nilgiri properties to Mr. A. E. Scovell, who recently reported on them and placed their value at Rs.1,25,000 or £8,333, after deducting for a Government assessment of Rs.514 a year. The acreage is 438·88, 145 being old tea, 62 cinchona, 30 forest and 201 88 waste land, chiefly old cinchona fields. Mr. Scovell has, the *Ceylon Observer* thinks, got a bargain. Our contemporary remarks:—There is a considerable extent of tea planted on good soil in a perfect climate for high-class produce, hitherto neglected, and only wanting careful cultivation and management for the tea to get a special price and name for itself. And then there is a valuable area under cinchona, with many thousands of trees of a mature age. Altogether, it is the property and opening that would, in our opinion, be jumped at, if on our Ceylon hills; and we cannot see that, being on the Nilgiris within easy reach of Ootacamund, should make a great difference, although no doubt the Labour Supply question is not so easily dealt with in the Nilgiris as in Ceylon. Still, for a planter understanding his business, with the needful capital, there could be no great difficulty in successful management.

Java Government Cinchona. The quarterly report on the Government cinchona-plantations in Java for the three months ending March 31, 1899, has just been published. It is somewhat less satisfactory than the last one, mainly owing to the fact that the rainfall has been more than 50 per cent. below the average; this was particularly the case in the Bandong district, where the average of March equals 14 per cent. of the total rainfall for the year, but in March, 1899, it only reached 4 per cent. In March damage was done by heavy gales, and also by insects, but several plantations usually affected by insects escaped, owing to the method adopted of regularly burying the fallen leaves. The expense of increased labour has as yet prevented a general adoption of this plan; but with the experience now gained, it will no doubt be largely extended in future. The harvesting of bark commenced as early as January—earlier than in previous years—as some plantations had been left over in 1898, so as to keep down the production of that year. The number of plants in the nurseries was 1,580,000 (1,240,000

edgeriana, 315,000 *Succirubra*, and 25,000 *hybrids*), and the plantations 2,602,300, of which 1,616,000 were *Ledgeriana*, 494,000 *hybrids*, 444,300 *Succirubra*, and 48,000 *officinalis*.

---

ale Coffee Plants.

The following from a contemporary may interest, though it will not instruct:—"It is hard to say whether there are any male coffee plants. The coffee is an hermaphrodite, the pistil and stamens occurring in the same flower. Natives call all 'chick' trees which are characterised by throwing up their branches almost vertically, *gandoo gidas*, or male plants; but the chick tree bears crop and so cannot be a male tree. Once there was an amusing discussion between a planter and a missionary who was a bit of a botanist. The former said that he had some male trees. He meant chick trees and pointed out one, but the missionary objected that it could not possibly be a male tree as it had crop on it. The planter, however, stoutly maintained that it was a male tree, as its structure was so different to the others. I am afraid he owed the idea entirely to the natives. But there are some trees with very narrow leaves to be met with here and there on an estate which never bear crop. I don't know whether they ever bear blossom. I must watch one of these trees during the next blossoming season. I suppose it is merely an undesirable hybrid, but if the flowers discover only stamens and the pistils are entirely absent, I suppose it will settle the fact that they are male trees. A mixture of male trees among the others would, of course, be utterly useless; and they would only be worth keeping as a curiosity."

Currency and Exchange in Ecuador.

They seem to have a nice little way of settling exchange troubles in Ecuador; would that India could find an equally successful method. The British Consul in Ecuador reports:—The agréement between the merchants and the banks to sustain a uniform rate of exchange, *viz.*, 100 per cent 90 days' sight bills on London, or, say, 24d. per sucre, has been conscientiously carried out by all concerned throughout the year. On July 14, it was decided by a meeting that the agreement should remain in force until the Congress of 1898 came to a decision respecting the projected new currency law establishing a gold basis for the Republic, and further that, if such new currency law were adopted, the agreement would remain binding without further ratification until the law came into force. It is with great satisfaction that I am able to report that this law actually passed, and the preparations to establish a gold standard are already well advanced. The Bank of Ecuador has already accumulated about £45,000 in gold and the Banco Commercial y Agricola £110,000 and the Government has agreed to sign contracts for the conversion of more than 2,000,000 sucres (silver) into Ecuadorian gold condors, the nation paying the loss in the silver to be exported between its actual value and the nominal value of the sucre of 24d., and all expenses of freight and coinage, &c. The law is to come in force in 1901. One of its principal features is that the British £1 is declared legal tender in the Republic for the same value as the Ecuadorian condor, and the latter is to be coined of exactly the intrinsic value of the £1.

LETTERS TO THE EDITOR.

THE CURRENCY QUESTION.

SIR,—A friend has just sent me a copy of your Journal of the 1st July, and I note the little para. "Tu Quoque." You are quite right in both your surmises. I have lived too long in this world to be aware that an occasional letter of mine to the papers would have any influence with Government. Still, there is no harm in giving them a word of warning. I was out of the country during the time of the discussion of the subject of the Financial Policy of the Government by the U. P. A. S. I., or, perhaps, I might have lifted up my voice to some effect.

When I left the country I was of opinion that my brother planters were as keenly alive to what was best in their interests as I was; but, judging from results, I find these were in a minority. From the recent correspondence in the *Mail*, I observe that the majority is now feeling the effects of that policy; but, judging from the numerous remedies advised by which the evil may be met, the main point is lost sight of.

The question of fixing the rupee at a value which in reality it has not got is a most momentous one, not only to Coffee Planters, but to every producer in India. The position taken up by the *Madras Mail* is not what I should have expected from a paper of such high standing, and from what I have seen of *Planting Opinion*, I do not think it has done as much as it might have done in counteracting the influence which the *Mail* undoubtedly carries.

JOHN LOGAN.

SIDAPUR,
15*th July* 1899.

GENERAL ARTICLES.

QUESTIONING A QUINOLOGIST.

Mr. David Hooper, F.I.C., the Curator of the Economic Section of the Indian Museum at Calcutta, is now at home on furlough, and we had the opportunity the other day of renewing our acquaintance with him. Mr. Hooper is one of our old Students' Corner prizemen, and is well known to many pharmacists at home. He had a distinguished career as a student. Before entering the School of Pharmacy, he obtained, in 1878, the bronze herbarium medal of the Pharmaceutical Society of Great Britain. He then entered the School of Pharmacy, and in the session of 1880 obtained distinction in every subject, but especially in Botany and Materia Medica for which he carried off the bronze and silver medals, and in Practical chemistry he was silver-medallist. After passing the Major examination, he carried off the blue ribbon of Pharmacy—the Pereira medal. Mr. Hooper then became an Assistant Chemist in Messrs. Corbyn, Stacey & Co's Laboratories, after which he was appointed Chemist to Messrs. Southall Brothers & Barclay, of Birmingham. While there Mr. Hooper applied for and obtained the appointment of Quinologist to the Government of Madras at Ootacamund, and there did excellent service, investigating many chemical and botanical problems, and making the arrangements for the manufacture of quinine. It is as a pharmacognosist, however, that Mr. Hooper is best known to scientific pharmacy. The preparation of "Pharmacographia Indica" was largely his work. The late Surgeon-Major Dymock, whose knowledge of Indian Materia Medica was so intimate, was a prominent co-author, also Surgeon-Major Warden, of Calcutta.

Mr. Hooper may be regarded as lieutenant to Dr. George Watt, the Reporter on Economic Products to the Indian Government. As Curator of the Calcutta Museum, his work has wider application

than Pharmacy, and, during his visit home, he is spending his time in inspecting the principal economic museums of Europe, inquiring into their systems, so that his own museum may be perfected in arrangement.

We were glad to hear from Mr. Hooper that the Indigenous Drugs Committee, of which he was Secretary during Dr. Watt's recent furlough in England, is making steady progress with its investigations. A certain number of Indian drugs are being systematically examined and reported upon in all their aspects, especially with regard to their origin, commerce, pharmacy, and therapeutic action. The last point embodies the chief difficulties, pharmacologists being scarce and full of work, so that most of the work in this department must be done in India with such resources as the medical officers have at their disposal. These are not ideal, but the results, as a whole, Mr. Hooper believes, will put Indian Materia Medica on a better platform than it has been hitherto, and there will be a better chance for the employment of Indian drugs in general practice throughout the world, and a decided opinion will be given on those qualified for inclusion in future Pharmacopœias.

The future of cinchona-cultivation in India naturally came up in the conversation This is now practically concentrated into the Government's hands, and as time goes on the *Cinchona officinalis*, which is the tree best adapted for India. and a rich yielder of quinine, will, to a large extent, displace all other kinds. *C. succirubra* provides the best cinchona febrifuge, but the trees are gradually being uprooted. We questioned the wisdom of reducing the cultivation of red-bark trees considering the present demand for cinchonidine, which is solely derived from this species ; but Mr. Hooper thought that this is probably a temporary prejudice, cinchonidine having no special advantage over the alkaloid quinine with its well-established anti-malarial properties. We innocently expressed the hope that the Ledger tree would be cultivated in India ; but Mr. Hooper made short work of that suggestion by saying that after many years' trial in different localities it cannot be profitably grown there, the soil, unlike that of the island of Java, being unsuitable for propagating the varieties of *C. Calisaya*. Mr. Hooper will not return to India until the autumn, and, if arrangements permit, he will attend the Conference at Plymouth, in order to make a communication and to renew old acquaintances. —*Chemist & Druggist.*

"REDDISH BROWN" TEA LEAF.

In reply to an inquiry as to "what errors in the manipulation of tea leaf could cause the *dry* leaf to have a reddish brown appearance," Mr. Geo. Thornton Pett writes to the *Ceylon Observer:* Here are a few suggestions, at his service, towards an answer:—

Under-withered leaf kept rather long in wet weather, gives, as you say in your note, a large percentage of red leaf.

Over-withered coarse leaf also gives a very large percentage of red and reddish leaf.

One seldom gets a good colour on tea made from fields in which the bushes have run a long time from pruning. Leaf carelessly treated in the withering lofts, left in heaps, and trodden on by coolies also turns out a reddish tea ; so does leaf that has got heated in bags or baskets whilst in transit to factory. The remedy for these is obvious.

I believe it is the almost universal experience in Ceylon, and I know it is a fact in several districts at medium elevations, that leaf plucked during a prolonged drought, and especially if there is any wind at the time, gives tea with a very pronounced reddish tinge, however fine the plucking may have been, and though there may be no actual red leaf in it. This tea, though wanting in black appearance, generally sells well, as the flavour is decidedly augmented: this is notably the case in Uva ; witness the sale prices of teas made on estates there in July and August, the dry months of that side of the country.

Re a second query : " Does the handling of the leaf in the drawers of drier cause greyness of the dry leaf?" Mr. Pett says: If he fills his drawers or trays properly, there should be but little handling required, and the *necessary* amount of such handling will not perceptibly "grey" the tea. A mistake some tea makers are apt to make, under the false impression that they are saving time, is allowing the firing coolies to lump on to the drawer or trays as much rolled leaf as they possibly can, when a good deal of turn over is, of course, required to get all the leaf fired equally. The should always be spread thinly, and pushed or worked the quickly. It is well to bear in mind the rule that was in force w we used chulas, *i.e.*, that it should be possible to see the fire thro the leaf on the loaded tray. Leaf *saturated* with water just be being put into the drier will, however, come out rather g much handled by the firing coolies, and a sort of black " bloom will be found adhering to the coolies' hands and the me the tray. I have ascertained this from actual experiment. bloom is, of course, sap from the leaf cells broken up in the roll and which has got diffused over the surface of the leaves. follows from this, I think, that leaf which has been carelessly mented, and allowed to get dry during the process, should be slightly moistened with water before firing and not saturated, have seen it done, by some tea makers.

PLANTERS'. ASSOCIATION OF CEYLON.

The following are extracts from the minutes of a Meeting the Committe of the Planters' Association of Ceylon, held at Kan on Friday afternoon, the 14th day of July.

MR. PHILIP'S ILLNESS.

The Chairman reported Mr. Alexander Philip's serious illn which necessitated his immediate departure to England. Resolve —" That the Committee desires to record its great appreciation the services of Mr. Alexander Philip as Secretary of the Associ tion during the past 23 years, and its deep regret that illn should have been the cause of his sudden departure, and its earne hope that he will regain his health and be again able to resu these duties which he has always carried out to the entire sat faction of the Association."

ACTING SECRETARY.

Resolved :—" That Mr. W. D. Gibbon be elected acting Secr tary during the absence of Mr. A. Philip, or pending furth arrangements."

DUTY ON TEA.

Read Secretary's reply to the Indian Tea Association relative British Import Duty on Tea, and acknowledgment from them, in mating their intention to comply with the request contained the Resolution forwarded after meeting of Committee on 12th Ma

DRAFT OF 1-LB. ALLOWANCE ON TEA.

Read letter from Mr. Wm. Martin Leake forwarding circul letter issued by the Indian Tea Association and Ceylon Associati in London, to all producers and importers of Tea. Read telegra Read letter from Secretary, Chamber of Commerce, enclosing co of Resolution passed at a General Meeting of the Chamber Commerce and Tea Traders' Association, held on 11th July.

The Chairman submitted copy of telegram from Indian Tea As ciation in Calcutta, and his reply.

Resolved :—" That this Committee will use their influence withhold teas for sale, for London market, until such time, as th 1-lb. draft dispute is ended. (II) That this Committee reques the Tea Traders' Association to suspend the sales of tea, held und the present conditions, and substitute auction sales, under spec conditions, corresponding in other respects to the former condition but with the addition that tea shall not be delivered for Londo until London sales are resumed, and that until such time a Proprietors, Directors of Companies, and Agents representi absent proprietors be urged to support the action of the Ceylon a Indian Associations in London : That the Indian Tea Associati be requested to cable conditions of recent sales."

REDUCED PASSAGES TO ENGLAND FOR PLANTERS.

Read letters from Colombo Agents of Steam Ship Compani acknowledging Resolution passed by this Committee at th Meeting on 12th May. Resolved :—" That the Agent of the Pen sular and Oriental Steam Navigation Company be asked to forw the Committee's Resolution to the Head Office in London, wh contains the arguments in favour of the request asked for."

EXHIBITS FOR THE PARIS EXHIBITION FOR 1900.

Read letter from Messrs. Tarrant Henderson & Co. Resolved — "That the District Associations be asked by the Chairman to sel an Estate or Estates, according to size of district to make comme

ial teas of three grades 5 lbs. of each grade, with copy of invoice, for he Paris Exhibition: That two estates be selected to make green ea and four estates to make fancy teas each of three grades: That he Northern Districts Association be asked to collect samples of eylon *cocoa*. That Messrs. J. Westland and John Spence be asked o collet samples of cardamoms: That Messrs. W. H. Wright and . Vander-Poorten be asked to collect samples of vanilla: That he Haputale Planters' Association and Badulla Planters' Association be asked to nominate two estates to send samples of 10 lbs. each f Ceylon Coffee Arabica: That the Northern Districts Planters' ssociation be asked to nominate two estates to send samples 10 lbs. ach of Liberian Coffee: That the Northern Districts Planters' ssociation and the Kalutara Planters' Association be asked to ominate two estates each to collect samples of rubber: That he Northern Districts Planters' Association be asked to collect mples of pepper: That the following gentlemen be asked to col-ct samples of cinchona:—Messrs. George Christie, ledgeriana; dward Rosling, officinalis; F. G. A. Lane, succirubra."

The Chairman intimated that all exhibits should be sent to the ecretary of the Paris Exhibition Committee, Colombo, by 15th ovember, 1899.

TOBACCO.

Read letter from Mr. H. A. Pickford relative to tobacco cultiva-n. Resolved:—"That he be informed that the matter must be t to private enterprise."

PRODUCE AND PLANTING.

No Change.—The latest report of the Commissioner of Customs Shanghai does not confirm the reports circulated freely some ne back that the Chinese were about to reform their methods of manufacture. The hopes expressed that the mandarins were last awakening to the advantage of preparing tea by machinery, are told, have been disappointed. There has been no improve-nt, says the report for 1898, in the treatment of tea, "nor is re likely to be as long as Russia takes nearly all the crop of ck as it is."

The Sorrows of the Tea Retailer.—The *Grocer* reproves those o foster the demand for cheap tea. It says "Consumers of tea e willing to pay a fair price for a good article, and it may be ped that those retailers who are fostering the demand for 'the illing canister,' and who are by so doing throwing away another ance of making a legitimate living profit, will curb their zeal and ilanthropy. Generally speaking, profit on sugar is almost an known quantity; at any rate, retailers do not get a fair return the labour and capital involved in its distribution. It will be great misfortune if the tea trade is allowed to drift in a similar rection, and an effort to check the diminution in the margin of ofit ought to be made before it is too late. Would the retail tributor's determination to secure a fair return on all his tea es limit the demand? We think not." Touching lightly upon sorrows of the retailer, the *Grocer* adds: "The tea trade been the subject of a great deal of attention during the last weeks. In several of the general newspapers statements have ently appeared to the effect that a quantity of tea containing appreciable percentage of 'dirt' has found its way to Mincing e, and sensation-mongers have been urging consumers 'to be heir guard against retailers who desire to charge them for tea to foist upon them an inferior article containing substances grown upon the tea plant.' It is a pity that such writers do make inquiries of the Commissioners of Customs before perpe-ing such libels on a trade which is generally conducted on as e a basis as any that could be mentioned. Following upon this aging statement came the assertion in the prosecution of on, Limited, last week that it is 'the universal custom of the e to weigh tea with the paper in which it is wrapped.' We ish this week another batch of protests against the assertion, it is to be feared that among the readers of some of the daily papers which did not give sufficient prominence to the radictions of the statement quoted above, distrust of retail tea-ers will be created."

Tea and Coffee in America.—They are trying tea as a rival to beer in New York. Tea saloons have been opened where it is sold for a penny a pint, and the buyer may have it hot or cold. Colonel Hadley, the inaugurator of the movement, is going to try and convince the poorer class of consumers that: "Tea builds up; alcohol burns up. Tea quenches thirst; beer starts a thirst." The plan also includes a scheme to induce the beer-drinker to substitute tea and place the daily saving in a bank. To encourage this the society start the account with a gift of 4s, with the understanding that the money formerly spent for beer, less that spent for tea, shall be deposited daily. This would mean a saving, where a pint of tea is taken instead of a pint of beer, of £17 12s, to which the society will add the balance to bring the year's saving up to £20. Coffee finds a more ready sale than tea in some quarters, because the former can be purchased at 4½d to 5d per pound, with a coupon for a gift in each package. This makes one gallon of coffee cost 2½d, while one gallon of tea of a poor sort costs 4d.

A New Use for Tea.—A correspondent who writes to a contemporary on the subject of fortune-telling "in the name of common-sense of society, and of religion," states that fees are now being extorted for the revelation of future events by the medium of tea leaves. He tells us that a professional lady attends at private houses, bringing her own teapot, and dares "to predict the future by the position of the tea-leaves when poured with due solemnity into a cup." These fortune-tellers have no preference for Indian and Ceylon tea unfortunately and can perform their cabalistic mysteries with either high or low grade teas.

THE SCIENTIFIC OFFICER FOR THE TEA DISTRICTS.

VIEWS OF DR. WATT.

The following is the text of the letter from Dr. Watt to Sir Patrick Playfair on the subject of a scientific officer for the tea district:—

DEAR SIR PATRICK PLAYFAIR,—I shall answer your enquiries categorically. You ask my opinion regarding the proposal to employ a Scientist to investigate numerous difficulties connected with the cultivation and manufacture of tea. Hitherto I have been consulted mainly as to the employment of an officer to investigate the problems that hinge on the pests and blights of the tea plant. It is true these would be very nearly covered by the investigation of the difficulties connected with cultivation, but I presume are altogether unconnected with the problems of manufacture. It would thus seem to me that the first step would be to definitely fix the field of operations contemplated for the proposed Scientific officer. If the Association expect to find a man capable to deal as an expert with every aspect of tea I venture to think that they are mistaken. It might be possible to secure a Biologist who could conduct useful and practical investigation into pests and fungal blights of the tea plant (but even here Entomology and Mycology are two widely different studies, and no single person can be an expert in both sciences). But that a Biologist could be an expert chemist at the same time, is contrary to all experience in such matters. Some few years ago the Association brought to India a chemist (Mr. Bamber), and he furnished a report which no doubt most of the members of the Association have read. Its practical value is, therefore, a point I need not deal with. At the present moment the Ceylon planters have engaged Mr. Bamber as Chemist, but they have secured also the services of Mr. E. E. Green, an Entomologist of the very highest European repute. Mr. Green is himself a tea planter of many years' experience, but has consented to become Government Entomologist mainly with the view to devote his entire energies to the investigation of the pests of the tea plant. With a Chemist and Entomologist at work, Ceylon may reasonably hope to make some progress, but I do not look with much favour to a scheme that would secure one officer, in the hope that he would be an expert on every scientific problem of tea planting. I should, therefore, recommend the Association to carefully consider whether they want a Chemist or Biologist as the first and most important consideration.

You ask me whether I approve of the proposal. Yes I do, subject to the qualification involved by the above remarks. That those responsible for the tea industry should bestir themselves to (*a*) discover remedies for the pests and blights, (*b*) to bring to light practical improvements in the quality and treatment of the plant, and (*c*) to perfect their methods of manufacture seem to me truisms that I should hardly be asked to state. I know of no industry of a similar magnitude where empiricism is allowed to have such limitless sway. In my report I have given numerous illustrations of diametrical opinions held by well informed and successful planters on almost every aspect of the industry. And this statement is admissible because of the immense capabilities and vast powers of endurance of the plant. Both opinions may be equally wide of the mark and the profits obtained far short of the practical possibilities. But there is a limit to this blindfold trusting to Providence and to the endurance of the plant, and that limit, in my opinion, is not very remote. I would, therefore, urge that there is scope for not one scientific expert for a few years but for half a dozen for a life time. If funds will not admit of the whole question being dealt with, the Association should decide whether they wish to secure a Biologist to investigate (*a*) above, or an Agriculturist to enquire into (*b*), or a Chemist to suggest improvements in (*c*).

You next ask me. could the officer work in connection with my Department. I have no doubt he could, and that I should be able to suggest many lines of enquiry that would save him from much loss of time through fruitless investigations. I was asked a similar question on a former occasion, and the Government of India submitted to your Association the appended passage from my reply (of which for convenience of reference I furnish herewith a copy). It will there be seen that I assumed chemistry was to be the primary qualification of the officer. That I also proposed (para. 5) his association with the laboratory of this office, but that he would require several other laboratories and a camp laboratory to conduct investigations while on tour through the tea districts.

You next ask me how far my investigations would render the employment of such an officer desirable or unnecessary. My personal investigations were conducted in one province only—Assam. They lasted for 2½ months, and were and are now intended purely and simply as denoting the urgency of the work. If they serve the further purpose of affording a useful programme for detailed and final operations they will fulfil all that I ever contemplated. I may add, however, that my report has been so favorably received that I have been looked upon as more or less an expert and have been constantly consulted, since its appearance, by planters all over India. As the result, much new information has been brought to light, so that already a second edition (if called for) would be a considerable improvement on the first.

What remuneration should the scientific officer receive?

The answer to this question turns on the term of years for which employed. If the Association were to seek for the services of an officer to be permanently employed the course which I should recommend—it might be possible to get a doctor of science with special qualifications in the chemistry of plant-life for Rs.1,000 rising by annual increments to Rs 1,500. This appointment would of course carry no pension, therefore would have to commence at a higher figure than would be the case with a Government servant. But if the appointment is to last only five years and it is desired to secure an officer of made reputation, the Association would have to offer not less than Rs 1,500 a month, with all expenses paid to and from India. The Government of India engaged an agricultural chemist and paid Rs.1,500. That circumstance, I think, is a fairly good reply to the question you put to me. Of course whether permanent of temporary, provision would have to be made for travelling-allowance, framed on the scale granted by Government to its servants, *viz.*,—double first class ticket by train or steamer. This covers servants, excess luggage, etc. A halting allowance of Rs.5 a day while away from head-quarters should also be made. In Assam everything is very expensive, hence the rates allowed in that province are higher than in most other provinces. The planters would no doubt assist the Scientific officer very greatly, but I may say that with all the assistance rendered to me, I was out of pocket by my tour in Assam, over and above the allowances made to me according to rules under which I come. I mention this circumstance in order to show that the scale I have proposed is the lowest possible rate that should be contemplated. In some instances Government commutes travelling allowances into a monthly grant, but I should think the Association would be safe in putti down Rs.300 a month as sufficient to cover these charges.

Where should his head-quarters be?—That is a very di question to answer. Were he to be employed in Assam o should instantly have said Shillong. There is a no occasion he should be confined to an unhealthy climate, or one in wh laboratory work would be difficult if not impossible. But would, I presume, have to investigate tea in Darjeeling, the Du Assam, Cachar, etc., Shillong might not be the most central. half think that if Calcutta itself was thought too far off, he m be located in Darjeeling. But he should have a small house laboratory constructed in Dibrugarh and in one or two centres well. I should insist that he spent a distinct period of every y on tour and visited in turn every garden under the Association should also lay down a hard and fast rule that every discovery made, connected with tea, became the property of the Associati In other words he should not be allowed to patent any proces method within a fixed term of years.

I think the above fully disposes of all the questions raised you, but if there were other points on which you wish my opin I shall be happy to be of service.

THE FUTURE OF CINCHONA.
